[Extract from act of Congress of June 18, 1898, defining the duties of the Industrial Commission showing the scope of its inquiries.]

Sec. 2. That it shall be the duty of this commission to investigate questions relating to immigration, to labor, to agriculture, to manufacturing, and to business, and to report to Congress and to suggest such legislation as it may deem best upon these subjects.

Sec. 3. That it shall furnish such information and suggest such laws as may be made a basis for uniform legislation by the various States of the Union, in order to harmonize conflicting interests and to be equitable to the laborer, the employer, the producer, and the consumer..

UNITED STATES INDUSTRIAL COMMISSION,
Washington, D. C., May 14, 1900.

SIR: I have the honor to transmit herewith, on behalf of the Industrial Commission, a preliminary report to Congress on the subject of Transportation, prepared in conformity with an act of Congress of June 18, 1898.

The Commission is not prepared at present to make recommendations to Congress or to the State legislatures, but contemplates the making of such recommendations hereafter.

Respectfully,

JAMES H. KYLE,
Chairman.

THE SPEAKER OF THE HOUSE OF REPRESENTATIVES.

REVIEW OF EVIDENCE.

INTRODUCTION.

The Industrial Commission has taken the testimony of many witnesses on the subject of transportation, especially railway transportation. These witnesses include representatives of all the important organizations of railway employees; representatives of many organizations of shippers and commercial bodies, as well as other shippers, officers of railways and of railway associations, members of the Interstate Commerce Commission, and special students of transportation questions—college professors and others. Several witnesses have also testified as to lake, canal, and ocean transportation. While detailed and specific statements as to the conditions of labor and traffic have not usually been sought, many general statements as to these conditions have been obtained, and although there is of course, not a little difference of opinion, certain conclusions as to facts emerge with fair clearness from the testimony. Naturally, there is even greater difference of judgment as to needed legislation; but here again it is possible to gather some fair conclusions concerning the preponderance of opinion among those most interested, as to some of the important problems now before the people. The Commission has not, however, completed its investigation of transportation. It is expected that additional testimony will be taken as to all phases of the subject, but more especially as to certain topics which have been investigated less fully, such as ticket brokerage, capitalization of railways, consolidation of railways, state railway commissions, taxation, conditions of water transportation, etc.

The wide-reaching social and economic influence of the means of transportation is indicated by the fact that questions relating to them have been discussed to a greater or less extent by the witnesses in connection with almost all the other investigations of the Commission—notably those on agriculture, trusts and industrial combinations, and capital and labor. The evidence in these investigations should be consulted in connection with the present volume.

FREIGHT DISCRIMINATIONS BETWEEN INDIVIDUALS.

There is a general consensus of opinion among practically all witnesses, including members of the Interstate Commerce Commission, representatives of shippers, and railway officers, that the railways still make discriminations between individuals, and perhaps to as great an extent as ever before. In fact, it is stated by numerous witnesses that discriminations were probably worse during the year 1898 than at any previous time. It is admitted that there is great difficulty in proving individual cases where shippers have been given special rates or other favors, but the witnesses declare that it is common knowledge among all familiar with the subject that such concessions are largely granted.¹ The arguments pre-

¹ Knapp, pp. 136, 138, 139, 142; Prouty, pp. 150-152; Clements, p. 159; Cowen, pp. 313-316; Blanchard, pp. 335, 336; Digalla, pp. 336, 337; Spencer, pp. 373, 376; Ripley, pp. 594, 595; Stickney, pp. 400-402; Bird, pp. 470, 471; Morton, pp. 493, 494, 495; Kelley, pp. 135, 136; Vanlandingham, pp. 194, 207; Douman, pp. 355, 356; Neall, pp. 173, 174.

sented by many railway officers in favor of pooling assert directly or indirectly the existence of discriminating rates. The representatives of the railways declare that so long as competition exists the attempt to get traffic by secret rates must continue.

It is thought generally that there has been a considerable improvement in the situation during the year 1899. This is attributed in part to the exceedingly heavy traffic which rendered it unnecessary for railroads to secure shipments by discriminating rates, and in part to a better spirit among the railways themselves. In the latter part of 1898, Messrs. Cowen and Murray, receivers of the Baltimore and Ohio Railroad, addressed a letter to the Interstate Commerce Commission declaring that the practice of granting rates below the published tariffs was so general as seriously to reduce the revenues of the railroads. More than 50 per cent of the traffic, at least on certain roads, was affected. The receivers expressed a determination to cooperate in the enforcement of the law. Later, conferences were held between the Interstate Commerce Commission and railway officers, which led to a general attempt to reduce the extent of the evil. Many witnesses, however, including representatives of the railroads, think that the improvement is only temporary and that when the present rush of traffic has ceased discriminating rates will be granted more and more.

A few witnesses are inclined to think that discriminations are not at present a very serious evil and are not likely to become such, especially since the published freight rates are now so low that no considerable concessions can be made from them with profit to the railroads; but the evidence is preponderatingly strong on the other side.¹

Methods and forms.—The methods by which discriminations are granted are stated by the witnesses to be very numerous. It is claimed by some that direct rebates and secret rates are still frequently granted; commissions are paid for securing freight; goods are billed at less than the actual weight; traffic within a State not subject to the interstate-commerce act is carried at lower rates; allowances and advantages are made in handling and storing, etc. Several witnesses refer to the practice of shipping goods under a false classification. Sometimes this is done without the knowledge of the railways, but in other cases they apparently connive. Thus, fine hardware may be shipped as some low-class kind of iron. A few specific instances of discriminations of different sorts were mentioned before the Commission, but no detailed evidence was taken to prove the exact character and amount of these discriminations.²

Effect of discriminations.—It is very generally acknowledged that discriminating favors are granted chiefly to large shippers at the expense of small shippers. This is natural, since the railways compete more actively for the traffic which a large shipper can furnish. It is claimed, also, that the effect of the penalties of the interstate-commerce act has been still further to limit the preferences to a few shippers, since this makes it more possible to secure secrecy. There seems, accordingly, to be weight in the suggestion made by several witnesses that railway discriminations tend to foster trusts and combinations; a position which was especially upheld by numerous witnesses in the investigation of the Industrial Commission on trusts. Mr. Blanchard and one or two other witnesses declare that it is in no way the purpose of railways to favor combinations or men of great wealth; in fact, they would prefer not to do so, since it gives these large shippers power to force still greater concessions. But the railways are in no position to refuse the demands of such shippers.³

² Gallagher, pp. 541-543; Fuller, pp. 442, 443; Prouty, pp. 149, 150; Snyderacker, pp. 398-400; Blanchard pp. 626, 675; Knapp, p. 132; Kelley, p. 136; Vanlandingham, pp. 210, 211.

³ Knapp, pp. 129, 142; Prouty, pp. 147, 148; Blanchard, pp. 683, 684; Reagan, p. 342; Bird, pp. 470, 471; Ripley, pp. 594, 595.

Carload and part carload shipments.—Witnesses on behalf of the railroads justify different rates on goods shipped in full carloads and in part carloads, and there appears no special objection to this practice on the part of other witnesses, so far as the differences are reasonable. It is claimed, however, that on shipments to the Pacific coast the rate on part carloads has been as much as 50 per cent higher than on carloads, the difference amounting to more than the possible profit of the dealer, and that this arrangement has practically prevented Eastern jobbers from selling directly to retailers in the Pacific States.¹

Private cars.—It is the practice of the railways, as was brought out clearly in the evidence, to allow the owners of private cars a mileage rate of from 6 mills to 1 cent per mile for the use of their cars. A very large proportion of the shipments of fruit and of dressed beef is made in such cars. Although the same mileage rates and the same freight rates are perhaps open to all shippers, only those possessed of very large capital are in a position to furnish private cars in sufficient numbers to carry on an important business. It is claimed by nearly all witnesses testifying on the subject, including several railway officers, that the mileage is excessive and represents an exceedingly high profit on the cost of the cars, to that extent giving the owner of private cars an advantage over his competitors. Many of the railways apparently would be glad to supply the needed cars themselves and to refuse to haul private cars, but without an agreement on the part of all the competing lines it is impossible for them to do so.² One or two witnesses think that the peculiar character of these cars makes it unwise that the railways should own them, and that the mileage rate is probably not excessive.³

Penalties for discriminations.—Several witnesses, especially railway officers, incline to the opinion that the existing law prohibiting discriminations would be more effective if the penalty of imprisonment were abolished and a high fine, to be assessed primarily upon the corporation rather than upon individuals, made the sole penalty. It is also claimed that railway officers, who are most likely to have definite evidence concerning discriminations, will not testify against one another if the result may be imprisonment, but that they would have no such scruple if the punishment were pecuniary only.⁴ It is suggested by some that each carload or shipment carried at a discriminating rate should be made the basis of a separate fine. Mr. Knapp, of the Interstate Commerce Commission, and one or two other witnesses, however, think that the threat of imprisonment is more effective than that of a fine, and especially urge that the mere granting of a right to sue for damages on account of discriminations is of very little effect in enforcing the law.⁵ Other witnesses suggest the inspection of books and accounts as a means of obtaining evidence and as a remedy for discriminations. (See p. 23.)

THE ALLEGED ELEVATOR MONOPOLY.

A considerable amount of testimony has been taken concerning the practice of the large elevator owners, especially at Chicago, in buying grain, and concerning its effect upon commission merchants, country grain dealers, and farmers.

The evidence is clear that the great terminal elevators at Chicago, and to a less degree in other grain markets, are owned by a comparatively few men or firms; that the owners of public elevators, where grain may be stored at fixed charges by any holder, also control great private elevators; that they themselves buy a very large proportion of the grain which comes into the public elevators; and

⁵ Knapp, p. 137; Spencer, p. 274; Reagan, p. 350.

that the business of handling grain on commission has been very greatly reduced by this practice. The elevator owners admit that they are very large buyers of grain. It is claimed by their opponents also, although the evidence is less definite, that these same owners of terminal elevators own or control most of the country elevators and warehouses; that in fact practically all the elevators along the lines and at the terminals of each railway system are in the hands of a single organization.¹

The opponents of these large dealers admit that the elevator owners pay more for grain to the local dealers and farmers than the commission merchants and small dealers can pay, but they declare that this is due to various unfair advantages. Thus, the elevator owners themselves are exempt from the terminal storage and transfer charges which must be paid by other persons—three-fourths of a cent for transfer and the first 10 days storage—which is alleged to be much more than the actual cost. It is further declared that the elevator owners receive great advantages from the railways in the forms of allowances for handling grain and of direct freight discriminations. In fact, it is held by many witnesses that the railway companies or their officers are largely interested in the elevators and in grain buying. The evidence as to discriminations in favor of the elevators is chiefly indirect, based either on general belief or on the known fact that the elevator owners often pay more for grain at country stations than the price at Chicago, Kansas City, or Milwaukee, minus the full freight rate, would warrant. The excess in the price offered was shown to be sometimes as high as 2 or 2½ cents on both wheat and corn. It was also stated that in 1890 a rebate of 5 cents per hundred was proved before the Interstate Commerce Commission to have been granted to certain elevator owners.²

It is also alleged that the Eastern railways have largely leased their transfer elevators, for transferring grain from Western to Eastern cars, to private companies which also deal in grain, and that the charges made by these companies are excessive, so that they have an advantage over competitors.

The elevator owners deny that the charge of ¼ of a cent for handling grain is excessive; the law permits 1½ cents to be charged, while the actual charge is the lowest known anywhere. They deny also that the railways operate elevators directly, or, in the cases where they own them, have given special favors in leasing them to the present operators; though no very detailed evidence is presented. Mr. Webster, of the Armour Elevator Company, claims that that company actually owns most of its numerous elevators and pays high rentals for the remainder, while Mr. Counsellman declares that the elevators on the Rock Island were built and paid for by his own firm. Mr. Webster also denies that the elevator owners receive discriminating rates from the railways.³

In view of the quite general acknowledgment among railway men that discriminations in favor of large shippers are still conspicuous, there seems to be a considerable probability that the claim that these large elevators receive favors from the railways, in one way or another, has some basis.

The elevator men explain further the reasons for their buying grain and for their advantages over competitors. They claim that the establishment of through rates on grain from the Mississippi River and other Western points to the seaboard lower, than the sum of the local rates from those points to Chicago and from Chicago east, gave an advantage to Eastern commission merchants and buyers, and Chicago elevator owners found it necessary to buy grain on a large scale and handle it in the same way, on through rates, in order to keep their ware-

REVIEW OF EVIDENCE.

houses from standing idle. Moreover, the competition of the newer markets of Minneapolis, Duluth, Kansas City, and elsewhere forced these men to buy grain to protect Chicago as a market. The advantages which have made it possible for them to compete successfully with other markets, and largely to take business away from commission merchants, arise from their large capital, which enable them to carry large quantities of grain in anticipation of favorable markets, from the elimination of commission and other intermediate charges, and from the ability to forego a part or all of the normal charge for actual elevator service. The elevator owners have the same advantage over commission merchants that any business man has who furnishes himself with all accessory materials and facilities, instead of obtaining them from others, especially from his competitors. One or two witnesses, however, claim that, as regards local buying, the small dealer, who has perhaps other business during the season when there is little grain buying, can handle the grain business more cheaply than a great concern.

Effect on prices.—The opponents of the elevator owners declare that there is a growing monopoly of the local elevators, those on each line of railway being largely controlled by a single firm. While there is still sometimes competition and while in such cases the large buyers pay the higher prices, sooner or later all competitors will be driven out and the farmer will be at the mercy of the great elevator owners. It is maintained, moreover, that where different elevator owners operate along the same line of railway they do not actively compete. On the contrary they meet daily on the Chicago Board of Trade and agree as to the prices which they will pay, at least as to certain territory. No evidence is presented to show specific cases where prices have been depressed by elevator owners.¹

To these charges the elevator owners² reply that, at least along many railroads, they do not control any large proportion of the local elevators. They buy largely from the local dealers, who compete among themselves; and there is nothing to check the competition of the different elevator concerns. There are few railroad stations which do not have two or more buyers. No agreement exists for limiting competition or fixing prices, except that certain leading Chicago elevator men do discuss daily the prices which they will pay in Kansas and other parts of the West, where the Chicago market comes into severe competition with other grain markets. The purpose is to agree upon a price high enough to bring the grain to Chicago. At practically all stations local dealers receive daily bids for their grain from a large number of buyers—often from 5 to 20. The existence of these competing bids is admitted by some of the opponents of the elevators.

Two country grain dealers from Iowa and Nebraska also testify that in their towns there are competing grain buyers, and that each of the local dealers receives bids directly from various elevator owners at Chicago and also from other markets, there being often a considerable range in the prices offered.³

The elevator owners maintain that the farmers are not only not injured by the existence of these large buyers, but that they are benefited by the elimination of various commissions and profits which were formerly paid by grain in its progress from the producer to the consumer, and by the many economies which elevator owners are able to effect. The elevator owner is satisfied with a little profit on a large business.⁴

The two local grain dealers referred to above also declare that the farmer benefits by the elimination of middlemen under the present practice. Moreover

the reduction of the risk borne by the local dealer, from the fact that he receives bids for his grain on the track every day, enables him to work on a narrower margin.

Quality of grain.—It is claimed by certain witnesses that the owners of public warehouses have an unjust advantage over competing grain dealers from the fact that they are able to deliver to those who hold storage certificates the poorest quality of grain which will meet the official grade, while the owners themselves can take the best quality, for which they are able to obtain a higher price. The representative of a prominent milling company especially declares that millers are forced to disregard official inspections in order to prevent the warehousemen from giving them inferior qualities.¹ The elevator owners, on the other hand, declare that their practice of mixing and cleaning grain for the purpose of improving the grades is beneficial to all concerned; that there are no instances proved where unjust discriminations as to the quality of grain have been made, and that it is absurd to expect them to furnish to the public grain better than the official inspection requires.² There seems little doubt, however, that opportunities do exist for the warehousemen who store grain for the public and who are also grain owners to get an advantage in the way suggested. This seems the more probable from the fact, brought out in the testimony of one or two witnesses who are especially familiar with grain inspection, that the official grading of grain is necessarily imperfect.³

EXPORT GRAIN RATES AND FLOUR SHIPMENTS.

It appears clearly from the evidence that the railways have of late made specially low rates on grain hauled to the seaboard for export, while higher rates have been maintained on grain intended for domestic use and on flour, whether for domestic use or export. The chief complaint as to this practice comes from the American millers. Although the evidence is not entirely clear on this point, it is stated that these special export rates have been granted for the most part only since February 1, 1899. The discriminations were so great at times during 1899 that, while the Chicago miller would have to pay 21 cents per 100 pounds to get his flour to New York, the English miller could take wheat from Chicago to New York for 13 cents. The discrimination on shipments from points on the Mississippi and Missouri rivers to the Eastern seaboard and to the Gulf ports was even greater. The Interstate Commerce Commission investigated this subject, and issued an order on August 9, 1899, that the difference between export rates on wheat and on flour should not exceed 2 cents per hundred from Chicago, although the commission admits that it doubts its power in the matter.

It appears that some slight changes in rates were made soon after this order, and that on November 1, 1899, the export rates on grain were raised so that the difference from Chicago to the seaboard was 2 cents, as suggested by the Commission. The through grain rates from the Mississippi River, however, were changed to a less extent, so that it would still cost from 3 to 7 cents more for a miller at Chicago, Milwaukee, or Indianapolis to carry grain from the West to his mill and flour from the mill to the seaboard than it would cost the English miller to take grain from the Mississippi River to the coast, while there were differences of about the same amount between export wheat and domestic wheat, putting the miller on the seacoast at a like disadvantage as compared with the English miller.⁴

The evidence seems conclusive that the effect of this discrimination has already been disastrous to our milling interests, and that probably, even with the dif-

¹ Carter, pp. 582, 583; Sager, pp. 450-452; Douman, p. 350; Greeley, p. 371.

ference in rates reduced as already shown, it will continue to be injurious. Although very large flour shipments continued to be made early in 1899, in order to meet previous contracts or to dispose of stocks on hand, there was later in the year a great decrease in the demand for American flour. The exports from Minneapolis during September, 1899, were one-fourth less than during September, 1898, while exports from Duluth decreased more than one-half. At present American flour has a reputation which tends to keep up the demand, but when it is found that European millers are able to secure the same quality of grain and, owing to lower freight rates and cheaper labor, to turn it into flour at a reduced price, the American millers will probably find it very difficult to export, especially since the margin of profit in milling is very low.¹

Justification of discriminations discussed.—The representatives of several railways, as well as one or two shipping merchants, declare that it is justifiable to make lower rates on grain for export than on grain for domestic use. The price of grain in foreign markets is determined by the competition of sources of supply all over the world, and American grain can be sold there only if it meets the market price. At times the conditions of competition are such that only by making a very low freight rate could American wheat be sold at all. The low export rate relieves the country of a surplus and is beneficial to the farmers; it is similar to the practice of manufacturers in selling their surplus abroad at lower prices than at home. If the railroads were compelled to make an equally low rate on grain for domestic use, they would be unable to make any profit whatever.²

One or two representatives of the railways also assert that the competition of Canadian carriers is more severe as to export grain than as to domestic grain, and that lower export rates are thus forced upon American railways.³

On the other hand, Mr. Prouty, of the Interstate Commerce Commission, declares that the investigation of that body showed that the market conditions in Europe during 1899 did not necessitate low export rates, but that the reduction in these rates was due primarily to the bitter competition of the American trunk lines. Several other witnesses hold the same opinion, and especially contend that these low export rates scarcely existed prior to 1899, and that no special change in conditions has arisen to necessitate them. America can produce grain as cheaply as any country, and lower export rates are less justifiable on grain than they would be on manufactured products.⁴

Railway officers also defend the making of lower rates on grain as compared with flour. The chief argument is that grain is easier and cheaper to handle, both as regards the weight which can be loaded into cars and as regards terminal services. Moreover, water competition is stronger in the case of wheat than of flour, especially because of the greater convenience with which grain can be loaded and unloaded from vessels. It is claimed also that railways can get full train loads of grain, and can get them at times when shipments are especially desired. Railways always charge higher rates for more valuable and more elaborated products than for cheaper crude products.⁵

Other witnesses,⁶ however, declare emphatically that the railways can handle flour as cheaply as wheat. Flour for export, which is always in bags, can be piled up so as to make the load quite as heavy as that of wheat, and equal to the

¹ Barry, pp. 243, 246; Vanlandingham, p. 196; Sager, pp. 447, 448, 453; Gallagher, pp. 539, 545, 546, Evans, pp. 436-437.

⁵ Callaway, pp. 232, 233; Bird, pp. 473, 474; Tucker, pp. 563, 564; Blanchard, pp. 672, 673.

⁶ Barry, pp. 244-250; Vanlandingham, pp. 197, 203-205; Bacon, p. 424; Evans, pp. 426-438; Sager, pp. 449, 450; Gallagher, pp. 540, 541, 543; Neall, pp. 194-196.

full capacity of the car. If the actual weight of carloads of flour averages less than that of wheat, it can be due only to the fault of railways, which often furnish small, old-fashioned cars for flour shipments. The expense of handling at terminals is not to be considered, since the cars are loaded by the miller and unloaded by the consignee. Grain shipments tend to concentrate themselves during a short period after harvest, when they interfere with other shipments and prevent the securing of return loads. The gradual shipment of flour throughout the year is an advantage to the railways. It should be to the interest of the railways also to favor milling interests because of the traffic in mill supplies and in the goods consumed by mill employees. One or two witnesses think that the reason for discrimination is that railways are interested in grain elevators and are themselves dealers in grain (see above, p. 8), while others believe that the officers of railways are interested in the terminal elevators and transfer facilities at the seaboard ports, especially at New York, and derive a profit from handling grain. This last argument is specifically denied by the representatives of the railways.¹

Import rates.—It appears also from the testimony that railways sometimes make lower rates on goods imported from other countries than on the same goods produced in this country. Indeed, instances were mentioned in which the through rates, including ocean transportation, from European countries to inland points, or to the Pacific coast, have been considerably lower than the rates from points in this country, over the same routes, to the same destination.²

Remedy.—In view of the discriminations which are thus shown to have existed between the rates on goods exported or imported and goods of domestic origin and destination, it is urged by several witnesses that the power of the Interstate Commerce Commission be specifically extended to cover export and import traffic. It is claimed by some that the commission already has such power, but this is denied by many railway men, and the courts have held, as regards import traffic, that the commission has no power.³

DISCRIMINATIONS BETWEEN PLACES.

Many witnesses presented evidence concerning what they considered to be unjust discriminations in rates as between different places. Mr. Knapp points out that such discriminations are not secret, but result from unfairness of published tariffs.⁴

Long and short haul.—The form of place discriminations which is most conspicuously recognized in the interstate-commerce act is that of higher rates for a shorter distance over the same track than for a longer one. The so-called long and short haul clause of the act, however, declares such differences illegal only where conditions are similar, and it has been held by the courts that dissimilarity of conditions is caused by water competition, and even by competition among railways themselves. The witnesses point out that terminal points are naturally subject to such competition to a far greater degree than intermediate points. In the Southern States, largely on account of water competition along the Atlantic and Gulf coasts, and in the Western States also, on account of ocean transportation, the rates to terminal points are often conspicuously lower than those to intermediate points. The policy of the railways is stated by the members of the Interstate Commerce Commission to be to charge a gradually increasing rate to local points according to distance, until the rate becomes such that it would cost no more to ship the goods through to the terminal point and back to the local station.

⁴ P. 123.

Since terminal charges are an important factor in rates, the intermediate rate may thus be materially higher than the through rate.¹

Numerous specific instances were submitted by a witness residing in Colorado to show that the rates for the shorter haul from Chicago and other Eastern points to that State were much higher than those for the haul to Pacific coast points. Moreover, the rates on various commodities from Colorado to the Pacific coast and other Western points were shown to be often higher than those from Eastern points to the same destination. Thus the freight on books from Chicago to San Francisco was \$1.75 per hundred pounds, and from Denver to San Francisco \$3. The rate on boots and shoes from Chicago to Denver was \$2.05, and from Chicago to San Francisco \$1.50, etc. The witness claimed that the jobbing and manufacturing interests of Colorado have been very greatly injured by these discriminations.²

Other instances of higher rates for shorter hauls over the same road were mentioned by witnesses in connection with more general complaints as to differences in rates, often by separate roads, in favor of one market as against another.

A few witnesses think that the provision that dissimilar conditions may justify lower rates to competitive than to intermediate points should be repealed, or at least that the Interstate Commerce Commission should be given final authority to decide as to the justice of rates to different places on the same line.³

Several representatives of the railroads, however, declare that discriminations between long and short hauls are made only under stress of necessity, and that if the rates for the shorter hauls are themselves reasonable, there should be no objection against lower rates to through points. At least one of these witnesses thinks that the entire long and short haul clause should be dropped from the interstate-commerce act.⁴

Other place discriminations.—Most of the discriminations between places of which complaint was made are between different terminal points or central markets, as distinguished from discriminations between terminal and intermediate points. Frequently the rates complained of are not made by the same railway system, but by different ones, with or without agreement among themselves. Thus the trunk lines from the West to the Eastern seaboard compete actively, especially for the export traffic in grain and grain products. It is a matter of indifference often to grain shippers whether their goods go by way of New York, Philadelphia, Baltimore, or other ports. Each railroad and each terminal point considers itself entitled to a certain proportion of traffic, and naturally the opinion of each differs from that of the other. In the particular case referred to an agreement was reached more than 20 years ago permitting railroads reaching Philadelphia to charge a rate 2 cents less per hundred pounds than those reaching New York, and granting those reaching Baltimore and more southern ports a similar "differential" of 8 cents. Each of the ports is inclined to complain that this adjustment of differentials is unfair.⁵

Similar adjustments of rates have been made with a view to putting the leading cities of the central West more or less on a par as distributing points for goods shipped from the East and as marketing points for grain and other products. Railway officers point out the immense difficulty of adjusting rates so as to do justice to different sections and cities, and the practical impossibility of satisfying all. They declare that the attempt of each railway, each section, and each city to get the largest possible proportion of traffic has been the chief cause of rate wars and disturbances, especially in the Northwestern States.⁶ Since repre-

representatives of each of the leading cities are prepared to make complaints against each of the others, a large number of such conflicting complaints being actually made before the Industrial Commission,¹ it becomes very difficult for any public authority to decide as to the justice of the rates in any particular case.

Special reference was made by several witnesses to the effect of transportation by way of the Gulf of Mexico and the railroads of the central West upon rail rates between that section and the Eastern seaboard. Some witnesses think that an undue proportion of traffic is diverted to Kansas City, St. Louis, New Orleans, and Galveston, and that the rail rates favor those points, while other witnesses think that the natural conditions—distances, grades, etc.—would justify the Southern ports in demanding a much larger proportion of the traffic than they actually receive.²

POOLING.

A large number of witnesses discussed the question of permitting railways to make pooling and other agreements. It was pointed out that pools were to be distinguished from other agreements as to rates or as to other matters. In the pool an agreement is made as to the proportion of business to be allotted to each of the roads entering the arrangement. Either tonnage is diverted from the roads receiving more than the agreed proportion or a money payment representing the profit on the surplus tonnage is made. Pooling agreements seldom fix rates, although, of course, rates are in practice greatly affected by them.³

The interstate-commerce act specifically prohibits pools, while the antitrust act of 1890 has been interpreted as prohibiting associations and agreements among railways with a view to fixing rates. It is now advocated by many witnesses that railways should be permitted to make agreements of any kind, and that pooling contracts should be not only legalized, but made enforceable by law. The chief difficulty, it is said, with the pools which formerly existed was that they were outside of the pale of the law, and that there was no way of punishing a railway belonging to a pool which should attempt to divert traffic to itself or should refuse to divide returns. The advocates of pooling include nearly all of the railway officers who appeared before the Commission. A number of shippers, representatives of commercial bodies, members of the Interstate Commerce Commission, and other expert students of transportation also favor pooling, but usually only with the proviso that much more effective governmental control than at present be exercised over rates and over pooling contracts. It was declared by two or three witnesses also that a very general consensus of opinion in favor of pooling exists on the part of other persons throughout the country.⁴

Arguments against pooling are vigorously presented by Mr. Stickney, of the Chicago Great Western Railway, by two officers representing the Chicago Board of Trade, by Mr. Vanlandingham, the commissioner of the St. Louis Traffic Bureau, and by one or two others; their general position being that the practice would tend to maintain high rates by checking the legitimate competition between railways. Mr. Vanlandingham, however, would permit railways to agree as to rates.⁵

Pooling and competition.—The argument in favor of pooling rests on the position, as stated by several witnesses, that competition between railways is abnormal and destructive, tending to reduce rates to an unprofitable figure, to cause sudden fluctuations injurious to the stability of business, and to induce discriminations between individuals. Several witnesses maintain that the conditions of competition in the railway business are entirely different from those in the production and sale of ordinary commodities; that the poorest railway, such as one which is in the hands of receivers, and therefore not forced to pay dividends, can cut rates with a view to diverting traffic unduly, and can thereby force other railways to make unprofitable rates. The experience of the past with rate wars is referred to as evidence of the destructive character of railway competition. It is pointed out that the control which the Government can and does exercise over railway rates makes competition unnecessary, in a way which would not be true as to other business.¹

At the same time the defenders of pooling claim that pools would not absolutely prevent competition and would not permit railways to charge excessive rates. The competition of water carriers, not only those immediately parallel to railways but often those far distant, would in many cases keep down rates. The chief influence affecting rates is the competition of different markets, frequently of markets all over the world. If the railways in one section should attempt to maintain excessive rates, products of that section could not compete with those of another section, perhaps far removed. Reasonable competition, moreover, still exists among pooled railroads themselves, especially in the way of offering greater facilities and conveniences, for the sake of justifying a claim to a larger proportion of the business. The experience of the country with pools in the past is cited as showing that rates have not been maintained at excessive figures, but have actually been reduced under pools. It is also asserted that pooling is recognized in all leading European countries as a necessary remedy for excessive rate cutting and discriminations, government roads even entering pools with private lines, and that it has not tended toward excessive rates.²

On the other hand, it was claimed by two or three witnesses that competition is as natural, necessary, and beneficial in the railway business as in any other; that pooling would mean nothing else than monopoly, and that pools in the past have had injurious effects, tending toward excessive rates, and not preventing other evils.³

Pooling and discriminations.—Pooling is especially advocated by railway officers and others on the ground that it would tend to check discriminations between persons and between places, which it is claimed are the natural result of excessive competition. It is urged that the only method by which discriminations can be prevented is by interesting the railways themselves to prevent them.⁴

A few witnesses, however, maintain that railways would still be inclined to grant discriminating rates for the sake of increasing their proportion of traffic, in order to secure a larger allotment when the proportions of the roads in the pool should be fixed for the next time.⁵

To this it is replied that as a matter of fact the proportion of business allotted to each road is determined by other considerations than temporary changes in tonnage.⁶

Control of pooling by the Interstate Commerce Commission.—All of the members of the Interstate Commerce Commission, general students, and representatives of

⁶ Ripley, p. 596.

shippers who favor pooling think that the Interstate Commerce Commission should be given a very great degree of control over the terms of pools, and especially over the rates on pooled roads. Otherwise it is feared that extortionate rates may result from the removal of competition. Mr. Clements, of the Interstate Commerce Commission, is disposed to doubt the possibility of proper regulation, and hence the wisdom of permitting pooling at all. The majority of the railway officers who testify on this subject also express themselves as willing to concede such control to the commission, and there is no specific opposition to it. The degree of control suggested by the various witnesses of course differs. Many go so far as to favor giving the commission absolute power to approve or disapprove a pooling agreement or to discontinue it at any time, and also to fix rates finally so far as they apply to pooled traffic.¹ A few railway men think that the commission should be given little more power over the rates under pools than over rates in general.²

REASONABLENESS OF FREIGHT RATES.

There is comparatively little complaint on the part of witnesses before the Industrial Commission concerning excessive freight rates, aside from the complaints regarding discriminations between individuals and places.

On the other hand, many witnesses, including both representatives of railways and others, maintain that American freight rates are reasonable, and are, in fact, remarkably low. Some of these witnesses point out the great complexity of the influences affecting the carrying of freight, and the consequent difficulty of determining whether a particular freight rate is just. The justice of rates can be judged only by comparison between different commodities and different places, and by considering the profits of the railway. It is insisted that it is ordinarily impossible for freight rates to be excessive upon any railway or in any section of the country, on account of the competition of products and markets themselves. Rates must be made such that goods can be produced and marketed, and this fact not only is of prime importance in determining relative rates on different commodities, but also practically prevents unfairly high rates.³ For this reason the proposition⁴ that railway rates should be made strictly uniform on the basis of mileage is declared to be neither feasible nor necessary to secure justice. The differences of conditions, both as to the expenses of transportation and as to competition for markets, necessitate different charges in different parts of the country.⁵

It is shown further by the testimony that freight rates in the United States have decreased steadily and with considerable rapidity during the past 30 years. Numerous specific statistics concerning the decrease in rates are presented. For example, it is stated that the average rate per ton per mile in 1873 was 2.21 cents, and in 1895, 0.839 cent. At the same time it is claimed that the profits of the railway business have declined, the present returns on securities being, on the average, exceedingly low. Opinion as to the last matter will, of course, depend on the belief as to the extent to which railway securities represent actual investment of capital. (See p. 19.) It is also stated by many witnesses that the freight rates in this country are materially lower than in foreign countries, although it is admitted

that some of our local rates are as high as those abroad, the average being reduced by our low through rates on long hauls. No detailed comparisons of American and foreign freight rates have been thus far submitted.¹

CLASSIFICATION OF FREIGHT.

There is a movement of considerable strength in favor of a uniform system of classifying freight over the entire country. This is advocated by many shippers, and some of them are inclined to believe that the Interstate Commerce Commission should be given power to establish such a uniform classification, or at least to require the railways to do so. There are at present three different systems of classification—the Official, applying north of the Potomac and east of the Mississippi (with certain exceptions as to traffic west of Chicago); the Southern, applying south of the Potomac and east of the Mississippi, and the Western. It is claimed by shippers that great inconvenience occurs on account of the differences under these systems. It is impossible for shippers to ascertain accurately the rates on any particular commodity where it passes from one region to another having a different classification. The differences also give rise to discriminations between shippers. Thus goods shipped from Eastern points through Chicago to points in Wisconsin and Illinois come under the Official classification, while similar goods shipped directly from Chicago, from Mississippi River points, or other points in that section, come under the Western classification, by which the rates are likely to be higher, putting the Western shipper at a disadvantage in competition.²

A number of railway officers also expressed themselves in favor of uniform classification, and some of these believe it to be feasible to make the classes absolutely alike in all sections.³

Others, while admitting the desirability of more uniform classification, think that absolute uniformity is out of the question, and that the railroads should be left to approach more and more toward uniformity as their experience and interests may dictate. It is pointed out that the number of classifications, and the number of classes in each, have been greatly reduced in recent years, and that the railways themselves some time ago actively sought to secure a single classification, although the attempt failed on account of the opposition of certain railways in different sections to the assignment of particular commodities. It is urged by some witnesses with considerable force that the conditions of different sections necessitate differences in classification. In each section the goods which are most largely produced there must be given favoring rates in order that they may compete in the world market; while it would be unjust to require similarly low rates on railways in a section where little of such commodities is carried. It is declared that these differences in conditions have necessitated the adoption of special "commodity rates" outside of the regular classifications, and that even if a uniform classification should be established as regards most articles, these special rates on the more bulky commodities would still be necessary.⁴

There is evident a desire, however, on the part of both railways and shippers, that a greater degree of uniformity should be secured, and many favor conservative action of Government to further the movement. Most railway officers think that the railways themselves should frame the classification, even if uniformity be required by law, and comparatively few witnesses favor giving a Government commission entire control of classification.⁵

PASSENGER TRAFFIC.

Reasonableness of fares.—Little complaint has been made by witnesses on the ground that passenger fares are excessive or discriminating, although two or three declare that our fares are considerably higher than those in European countries.¹ Representatives of the railways, on the other hand, especially defend the reasonableness of American passenger charges. They think that satisfactory comparisons with other countries are impossible because of the European practice of establishing different classes with widely different fares. It is claimed, too, that the average service in America is very much superior in comfort, speed, and other regards to that in Europe. So far as differences in fares exist in different parts of the United States, these are justified chiefly on account of the differences in the density of traffic and in the consequent cost of transportation, while other special reasons account for particular variations in rates.²

*Passes.*³—There seems to be a general agreement among all classes of witnesses that the issue of free passes is carried to a degree which makes it a serious evil. It is generally claimed that fewer passes are issued now than ten or fifteen years ago, and that the railways themselves are more and more inclined to reduce the number. It appears, however, that passes are still frequently granted to the members of State and national legislatures and to public officers of many classes; that they are sometimes issued to shippers and thus may constitute a form of freight discrimination; while they are largely issued in exchange for newspaper advertising and for other services and to employees of railroads. Some witnesses think that the revenues of railways are reduced appreciably by granting free transportation, and that thus indirectly the fares of paying passengers are increased, but others think that the extent of the practice is not sufficient to have this effect. Stress is often laid on the opinion that the issue of passes to public officers and legislators involves an element of bribery; although some witnesses claim that this is not true, but that the practice is simply a conventional one due to respect for public authorities.

Most of the witnesses believe that practically no passes should be issued except to the employees of the issuing railway themselves, although some would favor issuing them to employees of other railways traveling on official business. Perhaps a majority of the witnesses consider legislation on the matter unnecessary, but not a few believe that laws would be helpful in aiding the railways to check the evil. Several States already have laws prohibiting the issue of passes to public officers, but one witness maintains that the effect of such laws is really to increase the number of passes, since officers, being unable to use them personally, demand them for their friends and supporters.

*Ticket brokerage.*⁴—Most witnesses so far heard on this subject are representatives of railways, and these almost uniformly favor legislation prohibiting the sale and purchase of unused parts of passenger tickets. This position is also taken by several other witnesses. The witnesses who discuss the subject most fully declare that ticket "scalping" usually consists in the purchase and sale of parts of tickets which have been issued by railways at less than the regular rates for some justifiable reason, with the understanding that the entire ticket shall be used by the original buyer. For example, round-trip tickets are sold at reduced rates. So, too, through tickets

⁴ Blanchard, pp. 621-623, 666-671; Morton, pp. 489, 500; Spencer, pp. 269-272; Ingalls, pp. 293, 294; Cowen, pp. 309, 310; Stickney, p. 457; Callaway, p. 227; Bird, p. 469; Reagan, p. 350; Johnson, p. 61; Wilson, p. 768; Fish, p. 333; Yanlandingham, p. 214.

are often issued over connecting lines, making a trip considerably longer than the shortest possible railway route; these tickets must necessarily be sold at the same price as those over the direct line, so that there is opportunity for scalping the separate coupons. It is maintained that the railways already usually provide for the redemption of unused parts of tickets at a rate such as to make the fare for the distance actually traveled the same as that which would have been paid if the ticket for that distance had been bought in the first place. At any rate, the witnesses would be willing that a law prohibiting scalping should include a requirement that unused tickets be redeemed in this way. It is claimed that the fear of unauthorized use of reduced-fare tickets has a material effect in preventing the sale of such tickets by the railroads. The general public suffers more from this effect, perhaps, than from the increase of ordinary fares necessitated by loss of revenue to the railways through scalping.

These witnesses claim also that ticket brokerage leads to many fraudulent and illegitimate practices, such as the alteration of dates, the forging of signatures, the counterfeiting of tickets, and the stealing of tickets by railroad employees. Moreover, railways themselves have often connived with ticket brokers by selling them tickets at reduced rates with a view to secretly drawing a larger proportion of traffic than they could secure under open and equal rates. Opinions differ as to the extent of this latter practice at present, although most witnesses think it is not so common as formerly. Some believe that if the railways should cease to patronize the brokers they would be driven out of business, but the more common opinion seems to be that a large part, perhaps the most, of their business comes from other sources.

Although various methods have been proposed by which the railways themselves should check the sale of unused parts of tickets, it is claimed that none of them is thoroughly effective and that the only sufficient remedy is to be found by direct legislation, either by Congress or by the States.

CAPITALIZATION OF RAILWAYS.

It has been suggested that judgment as to the reasonableness of rates and fares from the standpoint of the earnings of railways will depend largely upon the question whether or how far their capital is inflated. Several witnesses declare, in general terms, that the amount of the stocks and bonds of most railways is far greater than their original cost or the cost of reproduction, and that even the bonds in many cases exceed the actual cost of construction. No detailed investigation of this subject was made. Some of the witnesses advocate that hereafter the issue of stocks should be controlled carefully by State authorities or, so far as constitutionally possible, by Federal authorities.¹

Most of the arguments in opposition to this view are also of a general nature, pointing to the great increase in the value of terminals and of rights of way, to the large expenditure of earnings for improvement of properties, etc., as indicating that American railways, whether at first overcapitalized or not, are not now overcapitalized. It is also urged that overcapitalization in any case has practically no effect on rates, which are determined by competition (a statement which is questioned by one or two other witnesses), and that it does not deceive investors, since the market value of the stock is dependent on actual earning power.²

One witness presents detailed comparisons, showing that during the past decade the capitalization of American railways has increased only in proportion to the increase of mileage, while the capitalization of British railways has increased much more rapidly and is now fully four times as great per mile as that of American lines.³

³ Fish, pp. 329-332.

CONSOLIDATION OF RAILWAYS.

Several witnesses refer to the recent well-known tendency toward consolidation in the ownership of railways. These consolidations take the form either of the establishment of long connecting systems, or, in some cases, of the common ownership of parallel and previously competing lines. Little detailed evidence as to the extent of this process of consolidation was presented. Members of the Interstate Commerce Commission declare that, although consolidation may result in certain advantages, it also necessitates more effective supervision.¹

Railroad officers assert that consolidation has been forced in certain cases by the prohibition of pooling. It is also justifiable, they say, on account of the great economies in management and the improved facilities which are thus made possible. It is claimed that rates have been reduced, service improved, and discriminations checked by the consolidations hitherto made.²

The only representative of railway labor who mentions this subject sees nothing in consolidation to which to object.³

PROPOSED INCREASE OF POWERS OF INTERSTATE COMMERCE COMMISSION.

There is a very general feeling shown by the witnesses representing shippers, by members of the Interstate Commerce Commission, and others, that the interstate-commerce act should be amended so as to increase the powers of the Interstate Commerce Commission in one way or another. It is asserted that the commission has found its powers constantly decreased, especially by the interpretations of the courts, and that its influence is at present chiefly an educational one.⁴ The evils of railway management, these witnesses claim, are still many. The public character of railways, their great influence upon the general welfare, and their dependence on the State for their privileges, justify a greater degree of Government regulation of railways than of almost any other branch of industry, and a degree materially greater than is at present exercised.

Several railway officers recognize the public character of railroads, and some are willing that a greater measure of power should be given to the Interstate Commerce Commission. These same witnesses and others, however, argue that the rights of railways must also be considered, and that legislation must not prevent the furnishing of proper service, the payment of proper wages, or the earning of a fair return on the investment. It is thought by some of these witnesses that the public is disposed to be unduly hostile to railways.⁵

General power of commission over rates.—It is proposed by two or three witnesses that the Interstate Commerce Commission should have power to prepare general freight classifications and schedules of rates in the first instance, instead of being confined as at present to action on complaints concerning established rates and to the mere ability to declare existing rates unreasonable without prescribing other rates.⁶ Other witnesses think it would be sufficient to give the commission power to revise tariffs framed by the railroads, either on its own initiative or after complaint, and to reduce or change unreasonable rates, fixing the rate which shall prevail. Some of these witnesses hold that the decision of the

¹ Knapp, p. 141; Prouty, p. 153.

⁴ Knapp, pp. 135, 139, 140; Clements, p. 159; Kindel, p. 261; Musselman, p. 557; and the same position is implied in the demand of many others for specific additions to the commission's powers.

⁵ Ingalls, pp. 295, 298, 297; Ripley, pp. 594, 595; Blanchard, pp. 624, 625; Callaway, pp. 223, 227, 229; Bird, p. 479.

⁶ Reagan, pp. 339, 345, 346; Woffindin, pp. 555, 557; Clements, pp. 155, 158, 161.

commission in these cases should be final and not subject to appeal to the courts. They urge that the commission has technical knowledge of railway matters which is wanting in the judges. Others would be willing to have the courts review the decision, although they would have it enforced pending appeal. Detailed arguments are not presented in favor of this position, but it is claimed generally that many unjust rates still exist, both rates excessive in their amount, and open rates which discriminate between different places or classes of traffic. The power simply to declare a given rate unreasonable is very ineffective.¹

A few representatives of the railways would be willing to give the Interstate Commerce Commission power to revise rates or to fix them after complaint, but none of them thinks that the commission would be competent to fix rates, generally in the first instance, and most believe that it should be confined, as at present, to declaring existing rates unreasonable.² It is argued that the making of rates even for a single railway or section of the country is an exceedingly difficult task, and that no body of men, even though all were experts, could fix rates for the entire country. The influences affecting freight traffic are so numerous and complicated, and so constantly changing, that only the highest skill can fix rates even approximately fair to all interests. Some witnesses claim that even to fix a comparatively limited number of rates, under the power of revision, would in many cases be beyond the competency of a body of five men not especially trained by actual experience in railway management.

It is urged especially in this connection by Mr. Blanchard that the power to fix rates is essentially a legislative one, and that it would be contrary to our principles of government to give one body the power to fix rates in the first instance, to investigate as to compliance with them, by inspecting the accounts of railways and otherwise, and to judge concerning their reasonableness and application. In England, which is appealed to as an example, rates are not fixed by the railway and canal commission, but by act of Parliament; the railway and canal commission is restricted, for the most part, to purely judicial functions, and acts only in case of complaint. Moreover the English commission is composed partly of life members, and partly of judges who, as judges, have life tenure. This gives the body a judicial spirit not found in the Interstate Commerce Commission, which is subject to political influences, and which changes frequently in its membership. For these reasons this witness especially opposes the suggestion that the Interstate Commerce Commission be given final power.

Enforcement of commission's orders pending appeal.—Those who favor an increase of the powers of the Interstate Commerce Commission often lay even greater stress on the desirability of making its orders binding on the railways pending appeal to the courts than on that of giving it more extended power as to fixing rates in the first instance.³ The two positions are not always clearly distinguished, nor is issue always clearly drawn as to them between those witnesses who favor an increase in the regulation of railways and those who on the whole oppose it. Some railway officers are willing that the decisions of the commission should remain binding until declared unjust by the courts, although part of them apparently would wish to make this only as a concession in exchange for the privilege of pooling.

³ Clements, pp. 155, 158, 161; Moseley, pp. 41, 43; Newcomb, pp. 103, 104; Bacon, pp. 419-422; Vanlandingham, p. 212; Donsman, pp. 358-361; Mallory, pp. 587, 588; Baker, p. 592; Barry, pp. 246, 247, 250; Carter, p. 606; Musselman, p. 557; Stone, pp. 537, 538; Ingalls, pp. 299, 300; Cowen, pp. 314, 315; Evans, p. 429.

Those who favor the enforcement of the decisions of the Interstate Commerce Commission pending appeal declare that at present the railways very frequently, perhaps usually, disregard the orders of the commission, and that the commission is compelled to bring suit before a court to enforce them. The court takes up the matter *de novo*, considering not merely the law, but also the facts, and often taking entirely new evidence. The case may then be appealed from one court to another, and it may be years before a final decision is reached. Meantime the rates complained of have remained in force, and the injury may easily have become irreparable, or the occasion for the complaint, being of a temporary nature, may have disappeared. The right of the shipper to collect damages in view of a past injury is decidedly ineffective, especially since the burden of excessive or discriminating rates may have been shifted in part by him upon the general community. It is claimed that on this account, as well as because of the expense of pushing a case to final conclusion, persons injured by the action of railways have almost ceased to appeal to the Interstate Commerce Commission for relief. Much more is accomplished by the action of associations of shippers in influencing railways directly.

Some representatives of the railways oppose also this increase of the power of the Interstate Commerce Commission, presenting similar objections to those mentioned above. It is argued that the railways may be injured just as truly as the shippers by being compelled to make rates unjust to themselves pending appeal, and that they have no such recourse in damages as the shippers have. The courts may not have the technical knowledge possessed by the commission, but their proceedings are subject to fixed rules and the judges are trained to consider the principles of law and the rights of property, while their tenure of office makes them much freer from political and personal influences.¹

The conclusion seems clear from the testimony that the powers of the Interstate Commerce Commission at present are decidedly limited, probably somewhat more limited than was the intention of the framers of the interstate-commerce act. The suggestion is made by certain witnesses that some changes in the character of the commission itself, tending to make it more a judicial body, would make more justifiable an increase of its powers.

OTHER PROPOSED LEGISLATION.

Aside from the proposed legislation specially mentioned elsewhere, such as that regarding pooling, powers of the Interstate Commerce Commission, the issue of passes, ticket brokerage, railway labor, etc., various other suggestions have been advocated by one or more witnesses. The most important are the following:

1. *Membership of the Interstate Commerce Commission.*—It is thought that the Interstate Commerce Commission should be increased in number on account of the increase of railway business. A representative of the railways also urges that a certain proportion of the members should be railway men, familiar with the actual conditions of the business.²

2. *Conferences with railways.*—It is also suggested that special provisions should be made in the interstate-commerce law for conferences between the commission and representatives of the railways, with a view to promoting mutual understanding and harmony.³ Such conferences already held are said to have proved very useful. In this connection it is also recommended that the commission should issue a monthly bulletin stating all complaints, without the names of the railways or the complainants.

¹ Blanchard, pp. 659-665; Spencer, pp. 232, 233; Tucker, pp. 558, 560; Stickney, p. 403.

² Blanchard, pp. 664, 665, 673.

³ Blanchard, p. 665.

3. *Publicity of accounts.*—Numerous witnesses urge that all of the affairs of railways should be made much more public than at present. Publicity will tend to prevent excessive and discriminating rates on the one hand, and, on the other hand, will often dissipate prejudice against the railways by giving knowledge of actual facts. Indeed, it will promote mutual understanding and good feeling. For the sake of securing this publicity it is suggested that the Interstate Commerce Commission should have power to appoint inspectors to examine the books of railways, and also that reports should be required from the railways in much greater detail than at present. The public character of railway service is held especially to justify such publicity.¹ The advocates of publicity include several railway officers. On the other hand, two or three prominent railway officers think that little would be accomplished by the inspection of books, etc., and that perhaps some injustice would be done to the railways.²

4. *Construction of railways.*—Two or three witnesses representing the railways think that the United States and the separate States should restrict the construction of competing railroads as a protection to the existing lines. Additional railroads often involve a needless duplication of facilities, waste of capital, and excessive competition.³

5. *Control over water transportation.*—It is suggested by one or two witnesses that the absence of control by the Interstate Commerce Commission over water transportation results in unwarranted cutting of rates and unjust discriminations between persons and places, and it is thought that the power of the Commission should be extended to water carriers so far as regards coastwise, lake, and river traffic.⁴

6. *Control of shipments within States.*—It is urged, from both the standpoint of shippers and that of railways, that, if this were possible under the Constitution, it would be desirable that the National Government should have control over traffic within States as well as over interstate traffic. Much traffic moving wholly within a State is essentially interstate in character. Discriminations are often granted, it is claimed, on traffic within a State with a view to influencing shipments of interstate traffic; while inequalities as between different places easily arise from the absence of control over intrastate railways.⁵

GOVERNMENT OWNERSHIP.

Railroads.—Very few witnesses on transportation who have thus far appeared before the Commission have advocated government ownership of railways. Several witnesses in the trust investigation advocated public ownership of railways as the only effective means of preventing discriminations, and at least one witness in the transportation investigation suggests this as a sufficient ground for favoring public ownership.⁶ Another witness submits a somewhat detailed argument in favor of the system, declaring that it will tend to reduce fares and rates, to develop the country more rapidly and equally, to improve the condition of railway labor, to prevent losses and wastefulness arising from excessive competition and from speculation, and to produce still other advantages. It is believed by this witness that satisfactory financial results could be obtained from the railroads by the Government, as has been the case with the government railways of Prussia. He does not believe that there would be as serious political evils as those

⁶ Greeley, pp. 379-381.

which exist at present from the interference of private railways in politics, but he declares that thorough civil-service reform would be essential to the greatest success.¹

Several railway officers, on the other hand, declare that under private ownership American railways are furnishing better service at lower rates than the government railways of Europe. This statement is denied by one or two other witnesses, but no detailed evidence is submitted on either side. These officers insist that all government enterprises in this country are extravagantly managed and that government management of railways would necessarily be less economical than private ownership. They urge especially the political danger of making so many persons dependent on government employment, as well as that likely to arise from sectional conflicts as to construction of railways, rates, etc.² Two or three other witnesses aside from railway officers express essentially the same opinions.³

Professor Seligman, of Columbia University, presents the argument against government ownership more fully and broadly. He declares that the large capital invested in railways and the great complexity of their management make them unfit for public control, at the present stage of American political development, although he approves government ownership in Germany. Individual initiative turns ability most strongly toward reducing the cost of service by improved methods.⁴

Government ownership of telegraphs and telephones.—On the other hand, Professor Seligman thinks that the comparatively small capital involved in the telegraph and telephone business and the relative simplicity of their management favor public ownership, while the widespread social interest in these facilities makes government ownership, as against monopolistic private ownership, especially desirable. The telegraph and telephone are becoming as necessary as the post, and the same arguments which justify government control in one case justify it in the other.⁵ England and nearly all the continental countries of Europe have public telegraph and telephone systems. Several other witnesses complain of the high charges for telegraph and telephone service in this country, and express themselves in favor of putting these facilities under the Post-Office Department,⁶ while one or two express themselves as satisfied with existing conditions.⁷

RAILWAY TAXATION.

The most detailed testimony concerning the subject of railway taxation is that of Professor Seligman.⁸ He discusses the different methods of taxation, points out the great difficulty of avoiding double taxation as well as of preventing evasion, and reaches the conclusion that a tax based on net receipts is most equitable. Such a tax, however, would in practice be apt to result in evasions, unless there were a very thorough inspection of railway accounts by the Government. This difficulty has led many of our States to tax the gross receipts of railroads; a system which has many practical advantages, especially in view of the legal difficulties, under our Constitution, of the just taxation of stocks and bonds. The tax on gross receipts is also favored by Professor Johnson, of the

University of Pennsylvania,¹ Mr. Callaway,² of the New York Central, and Mr. Fish,³ of the Illinois Central. Mr. Newcomb, of the division of agriculture, United States Census, however, favors the net-receipts tax on the ground that a gross-receipts tax tends to produce high rates and fares.⁴

Two or three other witnesses prefer the system of assessment of the physical property of the railways for the general property tax. Mr. Reagan thinks that the assessment in that case should be made by the State railway commission rather than by any other authority.⁵

GENERAL RELATIONS OF RAILWAY EMPLOYERS AND EMPLOYEES.

The commission has taken the testimony of the chief officers of all the leading organizations of railway employees, as well as some testimony of representatives of the railways and of other witnesses, as to the conditions of railway labor.

Qualifications.—Some few complaints were made concerning the tests as to physical ability, eyesight, etc., and concerning the age limits fixed as conditions for employment on certain railways.⁶ Railway officers state that somewhat strict conditions regarding the use of intoxicants are usually imposed.

Union membership.—It appears from the testimony that most railways make no discrimination against members of the various brotherhoods and other organizations in granting employment or in the conditions of work; but it is claimed that occasionally there is such discrimination, especially against prominent union leaders. Although the United States statute of 1898 prohibiting this practice is not perhaps openly violated, men can be refused employment, denied promotion, or discharged, on various pretexts, where the real ground is objection to union membership. Several witnesses think that for the sake of reaching these exceptional cases the law should be made even more stringent and the penalty more severe than at present. This subject connects itself closely with that of blacklisting.⁷

Discharge and suspension.—It is also claimed by several witnesses that injustice is sometimes done in the discharge of railway employees. Thus men are at times discharged on account of personal whims and prejudices on the part of their immediate superiors, and without proper hearing. Employees are also sometimes suspended for various periods of time on account of offenses or neglect of duty, and occasionally, it is held, the charges are unwarranted or the penalties unduly severe. A few witnesses think, accordingly, that some legal restriction should be placed upon the discharge and suspension of railway employees, such as a requirement that they be given a hearing, preferably before a high officer of the railway company, or even before a specially constituted court.⁸ A prominent railway officer, however, urges that such a requirement would seriously interfere with effective discipline, and that it would be unjust in view of the responsibility of the employer for his servants,⁹ while the chief officers of the leading railway orders, in a joint statement, express doubt as to the desirability of legislation, holding that these organizations themselves afford a considerable degree of protection against unjust dismissals.¹⁰

Blacklisting.—Testimony was submitted to show that the practice of blacklisting, in one form or another, has been quite extensive during the past decade, although it is admitted that since the prohibition of the practice by the United

¹⁰ P. 760.

States arbitration act of 1898 it exists for the most part only in a secret form which is very difficult to reach. Railway officers, in fact, claim that the practice is largely dying out.¹ It appears clearly that men who took part in the Chicago strike of 1894 found it exceedingly difficult to obtain employment thereafter: Witnesses believe that there was an understanding among the railways that those who had taken part in the strike should not be employed. The letters which were given them by their former employers sometimes contained a statement of the fact that they had engaged in the strike. In other cases the very date of the letters gave a clue to employers. It is stated, also, that blacklists containing the names of strikers, and especially of leaders, were circulated among the railways.² Several witnesses think the requirement made at present by most railways, that applicants for employment must submit letters of recommendation from their former employers, has somewhat the effect of the former blacklists, especially since, as some believe, secret marks are at times attached to the letters to indicate that the person is not to be employed.³

Several witnesses accordingly urge that the existing penalties for the practice of blacklisting should be made even more severe with a view to checking these alleged secret practices.⁴ One witness thinks that the employer should be required to give a discharged employee a copy of every statement sent, even though by request, to any other employer. Two or three others doubt the necessity of further legislation, one railway switchman especially declaring that the requirement of recommendations from former employers has a good effect in raising the standard of service and shutting out those not worthy of employment.⁵

Railroad Y. M. C. A. and hospitals.—Two or three railway officers testify that, at least on their own roads, considerable effort is made to provide for the improvement and comfort of the men by the establishment of Young Men's Christian Associations, and of hospitals, the expense being borne in part by the company.⁶

WAGES AND HOURS OF LABOR.

A number of witnesses testify concerning the wages of different classes of railway employees. There is little complaint on the part of men employed on trains. They are for the most part paid for the distance traveled, a certain distance constituting a day's work and any travel beyond that being paid for as overtime.⁷ On the other hand, track hands, especially those of the lowest grade, claim that they are underpaid.⁸ No special legislation in regard to wages is suggested.

On account of the nature of train service the hours of labor are necessarily very irregular. A certain distance must be covered before a train crew can be relieved, and the time required may be short or, under exceptional circumstances, may be exceedingly long. Trainmen are not inclined to complain, especially in view of the fact that they are usually paid extra wages when they travel more than a certain distance or when they are at work continuously for more than 10 or 12 hours. Laws have been passed in some States to restrict the number of hours which trainmen can work without being given rest, the main object being to protect the public safety. Most representatives of the railway employees are not disposed to advocate any legislation, beyond perhaps some provisions of this sort.⁹

⁹ Sargent, pp. 63, 80-88; Clark, p. 110; Callaway, p. 218; officers of the brotherhoods, p. 761. For opposing views see Ronemus, p. 760; Arnold, p. 763; Murphy, p. 779.

These witnesses, however, favor, on the whole, as regards most occupations, the legal 8-hour day.

On the other hand, it is claimed by several witnesses that the hours of trackmen, stationmen, telegraphers, etc., are often unduly long, and that it is possible to shorten them by employing more men. The chief officers of the brotherhoods of locomotive engineers, locomotive firemen, railway trainmen, railway conductors, and railway telegraphers, in a joint statement, express themselves in favor of legally limiting the hours of employees not in train service to 10 hours, while some others urged 8 hours as the legal limit for these employees.¹

It is claimed by representatives of the railways, and apparently conceded by representatives of employees, that there has been a material decrease in the running of trains on Sunday, and that it is the general purpose of the railways to relieve their men on that day as far as possible. It is pointed out, however, that a certain number of passenger trains are demanded on Sunday and that live stock and perishable freight must be carried through. An absolute prohibition of Sunday traffic, moreover, would often result in stopping trains at inconvenient places and in keeping men from getting to their homes. It is admitted that the laws which exist in several States, restricting the operation of Sunday trains, are often evaded in various ways.²

LABOR ORGANIZATIONS, STRIKES, ETC.

The railway brotherhoods.—Several witnesses testify concerning the organization, character, and working of the great railway brotherhoods and orders. It appears clear, both from the statements of the officers of these organizations and from those of the railway presidents and other persons, that these bodies are generally conservative and have been highly beneficial, not only to their members, but to the railway service generally. Much attention is paid by them to elevating the character and morale of the members. Mutual insurance is a prominent feature in nearly all the bodies, and it has apparently worked very successfully. The relations between the brotherhoods and the railways are usually friendly, although a few of the railways refuse to recognize them. In many cases contracts concerning wages and conditions of labor are made directly between railways and the brotherhoods, while in other cases the railways discuss these matters with the representatives of the brotherhoods although contracts are not made directly with them. It is claimed that the organizations do not seek to antagonize nonunion labor, although as a matter of fact on many railways very nearly all of the employees belong to the organizations. Two or three witnesses distinguish sharply between these standard brotherhoods and orders and such temporary organizations as the American Railway Union, which are claimed to be under the control of professional agitators.³

Strikes.—It is stated by certain railway employees that strikes are probably somewhat less common on railways than in many other employments. It is admitted that strikes upon railways are more serious in their effects upon the community than those in any other industry.⁴ Several witnesses refer more or less incidentally to the great strike of 1894. It appears that it was formerly the rule of the organizations of railway employees, at least of the Brotherhood of Locomotive Engineers, to refuse to haul cars from any road upon which the mem-

⁴ Sargent, pp. 68, 71; Arthur, pp. 120, 126, 128; O'Rourke, p. 528; Strong, p. 506; Callaway, p. 221.

bers of the organization were engaged in a strike; but this practice having been enjoined by the courts it has been discontinued.

Injunctions in strikes.—Much testimony was presented concerning alleged abuses of the power of injunction by the courts in connection with railway strikes. Instances were mentioned in which injunctions have prohibited the most ordinary of acts connected with the carrying on of a strike, such as consultation by officers of organizations with one another and with the strikers, and requests, quite without any element of intimidation, to employees or to applicants for employment to refrain from working.¹ In other cases injunctions have been issued to restrain employees from performing criminal acts, such as destroying the property of employers. It is claimed by witnesses that this practice is unwarranted, since sufficient remedy exists under the criminal laws, and that, in fact, a person who is accused of violating an injunction of this class is deprived of the right of trial by jury, as well as of the ordinary protection of the rules of criminal procedure. Judges, moreover, it is held, are apt to be prejudiced against those accused of contempt in violating their orders. Several witnesses accordingly favor legislation restricting the power of the courts in issuing injunctions. Most of these suggestions are somewhat indefinite in their nature, but the chief officers of the leading railway orders, in a joint reply to a schedule of inquiries, declare themselves in favor of a national law, similar to that already enacted in Kansas, dividing contempts of court into two classes. Indirect contempts—those committed outside of the court—would under such a law be tried by procedure similar to that in criminal cases, and the decision would be subject to appeal.²

Especial complaint is made against the attempt on the part of the courts in one or two instances to compel specific performance of service on the part of employees. Thus, during the Northern Pacific Railway strike of 1894 an injunction was issued by a Federal district judge prohibiting the employees of that road from quitting or conspiring to quit employment in such a way as to cripple the property or hinder the operation of the railroad. This decision, to be sure, was afterwards reversed by the Circuit Court of Appeals on the ground that it was an invasion of natural liberty, although the court held that under certain circumstances a combination to quit employment in this way might be held an illegal conspiracy. In another case, when a strike was in force on the Toledo, Ann Arbor and North Michigan Railway, an injunction was issued restraining the employees of the Lake Shore and various other railways from refusing to handle cars and freight coming from the Ann Arbor road. The court held that an injunction could legally be issued not only against the railways themselves, but against their employees, in a case of this kind. Apparently this decision has remained in force. It is pointed out by the witnesses that the courts are especially inclined to issue injunctions regarding employees of railways in the hands of receivers, and, indeed, that sometimes without the previous issue of an injunction certain acts of employees upon railroads in the hands of receivers have been held to be in contempt of court.³

Arbitration.—The United States arbitration act of 1898 provides that either party to a labor controversy on interstate railroads may apply to the Commissioner of Labor and the chairman of the Interstate Commerce Commission to act as mediators. If mediation fails the parties may each appoint an arbitrator and a third shall be appointed by the Commissioner of Labor and the chairman of the Interstate Commerce Commission. It appears from the testimony that in

¹ Moseley, pp. 9-11; Sargent, p. 86; Arthur, p. 119.

² Moseley, pp. 12, 13; Johnson, p. 63; Sargent, pp. 65, 66; Wilson, p. 766; Ronemus, p. 769; Murphy, pp. 778, 780; officers of the railway orders, pp. 761, 762.

³ Moseley, pp. 8-13; Sargent, pp. 65, 66, 74-76, 86; Arthur, pp. 119, 120.

only one case has there so far been any application for mediation, and the employers in that case refused to accept mediation or arbitration. Some of the officers of the railway brotherhoods, however, think that the act has had a beneficial moral effect and needs no amendment.¹ Several officers of railways are satisfied with the act, but express the opinion that railways will not arbitrate any really important question, such as the rate of wages or the right of the railways to employ and discharge whom they will. The question of wages is so vital to the financial interest of the railroads that they would be unwilling to trust it to the decision of outside authorities.²

Compulsory arbitration is deprecated by most of the representatives of the railway employees, as well as by the officers of two or three railways who testified concerning the matter.³ A few witnesses, however, think that it should be compulsory upon the parties to railway disputes to submit their differences to the Interstate Commerce Commission or some other body, which should have full power to investigate. The decision should not, most of these hold, be enforceable at law, but it is believed that public opinion would compel the parties to conform to the recommendations of the arbitrators.⁴ The influence of public opinion is chiefly relied upon also by those who think the existing statute sufficient.

EMPLOYERS' LIABILITY.

A large number of witnesses representing railway employees, as well as two or three general witnesses not connected with railways, express themselves strongly in favor of some extension of the liability of railway employers for injuries to their employees. The railway officers who appeared before the Commission presented little specific opposition to this demand.

The common-law doctrine concerning employers' liability, and the modifications made by existing statutes, are summarized with considerable care by two of three of the witnesses, a large number of court decisions being referred to. The employee, it is said, is supposed to assume the ordinary risks of employment as to which he has or may be presumed to have knowledge. On the other hand, the employer is liable for defects in machinery or appliances of any sort, of which, by taking reasonable care, he might have had knowledge, as well as for failure to provide such facilities and appliances as reasonable care would demand. It is not, however, necessary, in the opinion of most courts, that the very best appliances should be furnished by the employer, although it appears that the recent tendency of the courts has been toward making greater requirements of the employer, especially as regards railroads. The employer is also liable for failure to make proper rules for the conduct of work. Comparatively little complaint is made by the witnesses as to the extent of the liability of employers in these regards. No witness, in fact, demands that the law of employers' liability shall be made as broad as in Great Britain, where the employer is liable for a limited amount of damages on account of injury from any cause whatever, in the absence of contributory negligence on the part of the employee injured.

The chief demand of the railway employees is that railways should be made responsible for injuries arising from the acts of fellow-servants. The common-law doctrine is that the employer is not liable if he has exercised reasonable care in selecting his servants; he is ordinarily liable only for the acts of those having positions of superintendence, designated as vice-principals. With regard to rail-

ways, the decisions of the American courts appear to be exceedingly conflicting in defining those who are considered fellow-employees as distinguished from vice-principals. Perhaps in the majority of instances, however, it is held that all persons not possessing the power of direction, although they are in an entirely different branch of the service, are fellow-servants. Thus, the railway company is not liable for injuries to men on trains arising from the negligence of switchmen or trackmen, and vice versa.

This common-law doctrine has been modified by statute in a number of States, at least to the extent of declaring that the railway shall be liable for injuries by acts of employees in a different branch of the service. Several witnesses, however, desire that laws of this nature shall be made uniform as far as possible, preferably by Federal enactment; and most of these think that the employer should be made liable for injuries to employees arising from the act of any other employee. It is declared that the employees have no choice whatever with regard to the fellow-servants with whom they are forced to work; whereas the employer picks out his men and should be responsible for his choice. It is said that where the liability of employers for the acts of fellow-servants has been extended by statute, they have become more careful in selecting their men, while, on the other hand, there has been no increase of carelessness on the part of the employees.¹ Mr. Callaway, president of the New York Central, thinks that railways would not especially object to being made liable for injuries to employees through negligence of fellow-servants, provided a similar liability were imposed upon other employers and provided a reasonable limit to the damages collectible were fixed.²

Complaint is also made by various witnesses on the ground that the Federal courts, before which a large proportion of suits for damages on account of injury are brought, do not conform in their decisions to the statute law or the decisions of the courts of highest resort of the State in which the injury occurs. Frequently, it is claimed, the railways by some device carry damage cases before the Federal courts for the express purpose of evading the statute or the rule of the State courts. These witnesses favor an act of Congress requiring the Federal courts to conform their decisions to those of the courts of last resort of the several States.³

RELIEF FUNDS OF RAILWAYS.⁴

It appears from the evidence that some half dozen of the leading railways of the country have established relief departments, supported mainly by assessments upon the men, while the railways perform the necessary routine business without charge and sometimes make regular contributions to the fund or supply deficits. Employees contributing to the fund are entitled to certain payments in case of death by accident or to weekly allowances during incapacity.

Complaint is quite general that contribution to these funds is practically compulsory on the part of the employees of the railways maintaining them. Three of the railways openly compelled their employees to join the relief departments up to the time of the enactment of the United States arbitration act of June 1, 1898, which prohibited such compulsion. It is stated by several representatives of the railway employees that excuses are still often given for refusing employment to those who are unwilling to become members of the relief department, or that they are not kept in the line of promotion, or are discriminated against in various

ways. Witnesses claim that employees who are members of such departments often lose in independence, since they do not wish to forfeit their interest in the fund by striking or leaving employment. Mr. Cowen admits that on the Baltimore and Ohio Railroad the applicant for employment must consent to contribute to the relief department, although he says that this does not constitute compulsion, since no one is forced to apply for employment.

It is also declared that the railways maintaining relief funds require those who accept payments from them to release the company from all further liability for damages. This practice is opposed strongly on the ground that the employees pay a full, and in some cases an exorbitant, rate for their insurance in the relief department, and that the receipt of money from the fund should not therefore be any bar to the collection of damages. It is admitted by Mr. Cowen that this requirement exists, at least on the Baltimore and Ohio, although he declares that the fact that the men have the right to sue for damages if they are willing to run the risk, relinquishing their claim upon the insurance fund, is a sufficient answer to complaints. The act of June 1, 1898, declares that the employer shall not be released from liability beyond the amount of his own contribution to the relief fund, but Mr. Cowen says that on the Baltimore and Ohio an absolute release is still required from those accepting relief from the fund.

Most witnesses on this subject urge that the law of 1898 in these two regards should be made more stringent.

SAFETY APPLIANCES AND ACCIDENTS.

The United States act of 1893, requiring railways, on or before January 1, 1898, to equip their engines and cars with air brakes, automatic couplers, and proper handholds, was only partly complied with by the railways at that date, and an extension of two years was granted by action of the Interstate Commerce Commission. It appears from the testimony before the Industrial Commission, mostly taken before January 1, 1900, that the railways for the most part had met the requirements of the act, and there appears to be no general complaint. It is believed by witnesses, including several railway officers, that the use of these appliances will have a very material effect in decreasing injuries to employees. A few witnesses recommend that acts similar to that of 1893 should be passed by all of the States with reference to railways lying wholly within their borders.¹

Report of accidents.—The members of the Interstate Commerce Commission think that railways should be required to report somewhat more in detail than at present concerning accidents, and this suggestion is upheld by representatives of the railway brotherhoods.²

OCEAN AND LAKE TRANSPORTATION.

American merchant marine.—The Industrial Commission has not sought thus far to make a detailed investigation on the subject of measures for developing an American merchant marine. Several witnesses in connection with other investigations of the commission have commented incidentally on the desirability of such measures. In the present investigation one witness, Mr. Neall, presents statistics showing the exceedingly small proportion of American ocean vessels, as compared with the total shipping of the world and as compared with the freight exported and imported by this country. The witness estimates that American-owned vessels actually suitable for transoceanic traffic have not over 300,000 gross tons register out of more than 27,000,000 gross tons for the world's shipping. Our

² Moseley, pp. 37, 38; officers of brotherhoods, p. 763; Sargent, p. 63; Clark, p. 114; cf. Stickney, p. 458.

American shipyards, he says, scarcely build any ordinary freight steamers, being entirely occupied with naval vessels and high-grade passenger vessels; and the cost of freight steamers here is very materially higher than abroad. Since he believes it would be impossible, even with the help of subsidies, for American shipyards to turn out within a reasonable time any large number of the kind of vessels specially needed, Mr. Neall advocates the passage of a law permitting Americans to buy vessels abroad and to place them under the American flag, these vessels to be prohibited from coastwise traffic.¹

Condition of American seamen.—Only one witness, Mr. Furuseth, the secretary of the Sailors' Union of the Pacific, has been examined on this subject. He states the amendments to the navigation laws which are advocated by the Seamen's Union, and presents a detailed account of the existing conditions among seamen in defense of these demands. The chief proposals are that the practice of permitting sailors to make "allotments" of their wages in advance be prohibited on the ground that it promotes the evil of crimping; that masters be required to pay sailors the wages due at any port, so that they may quit employment and not be forced, as at present, to continue service for the full period of time agreed upon, usually 12 months; that the required air space in the forecabin for each sailor be increased; that the majority of the crew be given the right to demand a survey of the condition of the vessel to assure themselves of its safety; that a certain standard of skill and experience be established for "able seamen," to prevent the shipping of incompetent men, which not only depresses wages but endangers the safety of the vessel and increases the work and responsibility of the experienced men; and that there be required a standard number of men for vessels according to their tonnage and rigging, to prevent the common evil of undermanning.²

Lake transportation.—A considerable amount of testimony was presented showing the magnitude of the traffic on the Great Lakes, the importance of its influence on rail rates, and the rapid increase of shipping and of traffic. No special legislation was advocated for furthering lake navigation, aside from general improvements of the waterways from time to time. Some witnesses, as we have seen, favor putting water carriers under the interstate-commerce act. Improvement of the Erie Canal and the construction of a ship canal from the lakes to the Mississippi are advocated by some witnesses.³

I. CAPITALIZATION, CONSTRUCTION, AND CONSOLIDATION OF RAILWAYS.

A. Are American railways overcapitalized?—Very little evidence was submitted to prove that railways are at present overcapitalized, but that they are is implied in the testimony of those who favor Government restriction. See paragraph B, below. The subject was not investigated in detail by the Commission.

Mr. CLEMENTS, a member of the commission, testifies that it is impossible to estimate even roughly what proportion of the \$11,000,000,000 capitalization of the railways of the United States represents actual money cost. He knows that many roads are capitalized at at least twice the original investment. (160.)

Mr. FISH, of the Illinois Central, presented a table comparing the changes in mileage, receipts, and capitalization of American railways from 1890 to 1898 with the corresponding changes in Great Britain. While the number of miles of railroad in the United States has increased 18.06 per cent during these eight years, the capitalization of our railways has increased only 14.64 per cent, the capitalization per mile of track remaining almost precisely the same. The gross receipts have increased 18.58 per cent, the gross receipts per mile having thus only very slightly increased, 0.45 per cent.

In the United Kingdom, on the other hand, while the number of miles operated has increased 7.9 per cent since 1890, the total capitalization of railways has increased 26.41 per cent, the capitalization per mile 17.15 per cent, the total gross receipts 20.39 per cent, and the gross receipts per mile 11.57 per cent.

The capitalization of American railways is \$60.343 per mile; that of British railways (at \$5 per pound) \$261.895. The capitalization per mile in Great Britain has increased \$38.345 since 1890. Although, on the whole, the English railways are better built than ours, there are many points in which ours excel.

In regard to railways in the South in particular, Mr. Fish says that much of their property was destroyed during the war and their capital was thus lost. There was a considerable amount of inflation and overcapitalization, going as far as rascality, during the reconstruction period, but the water in the stock has since been wiped out by reorganization.

Generally speaking, in fact, there has been a very great decrease in the fixed charges of American railways during the past ten years, even more from the reduction in the rate of interest than from reduction of capital. In most of the recent reorganizations bondholders have had to reduce their rate of interest from 7 to 8 or 4 per cent. (330-332.)

Mr. FISH says, further, that the capital of the Illinois Central Railroad has been increased from \$98,831,000 at the close of the war to about \$186,000,000. This increase is partly accounted for by the purchase of additional lines, but still more by the thorough reconstruction and reequipment of the system. Thus the weight of rails has been greatly increased during the past 10 years. Added capital is secured by the sale of bonds or stocks, as the condition of the market makes most desirable. Bonds have for a long period been sold at better prices than those of any other railway. In 1895 3 per cent bonds were floated. Bonds have always been sold at par or but a little below par. Stock has never been issued below par. It is first offered to stockholders at that rate, and what is not taken by them has always been sold at par, except once, when a premium was secured. Besides improvements made with new capital, probably \$20,000,000 of current earnings have been spent in making improvements. Moreover, there has been a very large natural increase in the value of the right of way and real estate of the Illinois Central, which has not been represented by added capitalization. An expert estimate by the mayor of Chicago has recently placed the value of the terminals of the railway in that city at \$34,500,000, but the land stands on the books at probably \$200,000. Early in the history of the railway large cash payments were made by the stockholders, and, although some of the stock was issued during the war on the basis of an inflated currency, there is absolutely no water in the present capitalization.

The Illinois Central has always paid semiannual dividends, the rate during recent years being 5 per cent. (826, 832.)

Mr. CALLAWAY, of the New York Central, declares that the practice of watering stock is practically obsolete. It has usually been found that overcapitalized companies very soon go into the hands of receivers. There are still roads whose stocks were originally largely watered, but the value of their properties has usually greatly increased. Thus the value of the real estate owned by the New York Central in New York City has increased till it amounts to fully the entire capital of the road. The methods of different railways as to expenditure for improvements vary materially. Many of them have improvement funds, supplied by issues of bonds and stocks, for the more important outlays. The Lake Shore has made it a practice to charge nearly all improvements to operating expenses. (227, 228.)

Mr. Callaway thinks that the practice of letting contracts for the construction of new lines to railroad officers themselves has been almost altogether discontinued, and that, in fact, the railways generally are managed very honestly. (226, 227.)

Mr. INGALLS, of the Chesapeake and Ohio, declares that the present capitalization of the railways of the country since their reorganization is less than the cost of reproducing them. Immediately after the civil war the people were anxious to get railways. Companies received land and other inducements, which they turned over to contractors, who issued bonds and stocks almost without limit. Reorganizations have proved necessary, and in many cases have been very severe in their effects on investors. The present cost of getting terminals in the cities would be enormous. The cost of right of way in the rural districts has also increased greatly, while outlay for equipment is very large. (298.)

Mr. COWEN, of the Baltimore and Ohio, is also of the opinion that none of the large and well-established railroads, certainly none of those east of the Mississippi and north of the Ohio, could be reproduced for their existing capital. Nevertheless there have been many mislocations of railways, representing a waste of capital. (318.)

Mr. VANLANDINGHAM, commissioner of the St. Louis Traffic Bureau, says that on most of the railways, especially in the West, stocks have been issued largely as bonus in connection with bonds. This is necessary on account of the risk of building in a new territory. Sometimes the development of the territory brings large profits to persons securing stocks in this way. (210.)

Mr. SARGENT, grand master of the Brotherhood of Locomotive Firemen, says that the increase of securities adds to the burden of the railways, and often leads to reduction of wages, foreclosures, and other evils. (70.)

B. Effects of overcapitalization and government control.—Mr. REAGAN, of the Texas railroad commission, declares that Congress and the several States should prohibit the issue of stocks and bonds by railroads except for money paid, labor done, or property actually received. The constitution and laws of Texas contain such provisions, designed to protect the people from imposition by means of watered and fraudulent stocks and bonds. A further statute of Texas, passed in 1893, provides that no bonds or other indebtedness shall be created over and above a reasonable value of the railroad property, except that in case of emergency the railroad commission may permit additional bonds to an amount not over 50 per cent above the value of the property. In order to prevent overcapitalization the railroad commission has made a careful valuation of the various railroads. The average value per mile has been found to be \$15,759 and the aggregate value \$141,117,176, the capitalization of the companies being \$362,953,383. The method adopted by the commission in making valuations is to ascertain the actual amount of cutting and filling and the character of the material, and to learn from construction companies and manufacturers the actual cost of cutting, grading, ties, rails, rolling stock, etc. The value of the right of way is also ascertained, and an allowance of about 6 per cent is made to cover the cost of charter fees and engineering and counsel expenses, and another allowance of about 6 per cent to cover interest during the period of construction. Although opportunity has been given for doing so, not one of the valuations thus made has been contested. (341, 342.)

Mr. Reagan criticises the dictum of the United States Supreme Court in the case of *Smythe v. Ames* as to the method of valuing the property of railways. He declares that there is no just relation between the original cost of construction and the present value. The railroads may have been built when material and labor were high or upon an excessive contract. Similarly, the amount spent in making permanent improvements may be greater than the present value. The amount and market value of bonds and stocks can be no just measure of the future value of a railroad, especially since market values fluctuate constantly and

often violently, because of speculation and manipulation. The safer method is that employed by the Texas commission—ascertaining the present cost. At the same time the railways are entitled to demand revaluations of their property from time to time in view of the improvements made and of the increased value of terminal property, etc. (343-345.)

Mr. KNAPP, chairman of the Interstate Commerce Commission, does not think that overcapitalization of railways influences their rates materially where there is competition, although when the reasonableness of rates is questioned in the courts or otherwise the cost of the road must necessarily be considered, and the capitalization may affect the decision. He believes that Government supervision over the issue of stocks of railways is therefore justifiable. (144, 145.)

Professor JOHNSON believes that in the long run the watering of stock is likely to tend to increase railway charges and to decrease wages. The percentage of dividends materially affects the attitude of legislators and the public toward railways. There are nothing but rough estimates as to the real value of our railways. Very often new stock issued does represent increase in actual value and cost of plant. It is doubtful whether Congress has constitutional power to control the issue of railway stock, but the experience of Massachusetts and Texas seems to favor some Government regulation of its issue. (60, 62.)

Mr. NEWCOMB, chief of the division of statistics, United States Department of Agriculture, thinks it is doubtful whether watering of stock has ever had any material influence on rates or has deceived legislators or others as to their justice. At any rate, there is now no possibility of such deception, and watered stock is a matter of concern only to investors. The rates of freight are determined by world-wide competition in the disposal of products. To increase rates beyond a legitimate level would shut out many goods from transportation. Wages also are little affected. (100, 101.)

Moreover, Mr. Newcomb continues, the cost of a railroad is not to be estimated by the original cost of construction. Most of our roads were built cheaply at first and have been greatly improved either through expenditure out of earnings or through new capital. Terminals, tunnels, bridges, etc., are often overlooked in estimates of cost. (101.)

Mr. MORTON, vice-president of the Atchison, Topeka and Santa Fe Railway, thinks that little would be gained by Government supervision of issues of stock by railroads. He admits that there has been and is overcapitalization, but declares that the price of securities indicates it. He does not approve of the watering of stock. (501.)

C. Government regulation of construction of railways.—Mr. BLANCHARD, late commissioner of the Joint Traffic Association, believes that the construction of new railroads should be restricted by proper governmental safeguards. There are more miles of railroad in this country in proportion to the population and tonnage than in any other. Existing roads need protection. The multiplication of securities of new railroads is an evil similar to the watering of stock of existing roads. The restriction of railway construction in England is especially referred to. (663, 680.)

Mr. INGALLS, of the Chesapeake and Ohio, believes that the approval of the Interstate Commerce Commission should be required for the construction of every railway, in order to prevent the building of parallel lines which are of no advantage to the public. The commission should also require that sufficient capital be subscribed and fully paid up. If the Government is to regulate railways, it needs also to protect them. (287.)

Mr. MORTON, of the Atchison, Topeka and Santa Fe, also believes that the construction of railroads should be subject to Federal supervision. Unnecessary duplication of lines has been one of the chief causes of our last two financial panics. The witness thinks that there are provisions in the laws of many States intended to restrict improper construction of railroads. (492, 503.)

D. Consolidation of railways.—Mr. KNAPP, chairman of the Interstate Commerce Commission, testifies that the consolidation of railways has gone so far in certain sections of the country that pooling arrangements for the maintenance of rates are no longer desired by the railways. He believes that the effect of such consolidation, through the elimination of destructive competition, has been a general reduction of rates and impartial treatment of shippers. (141.)

Mr. PHOURY, of the commission, also believes that the tendency toward consolidation has been beneficial in the same ways as suggested by Mr. Knapp. This is especially seen in New England. At the same time he considers that this tendency makes public supervision all the more necessary. (153.)

Mr. MORTON believes that consolidation of railroads is very desirable. The country is bound to have either legalized pooling or consolidation or Government ownership, and the witness thinks that the second, in conjunction with the first,

is the most advantageous. Consolidation tends to reduce charges, improve the service, advance wages, and check favoritism to individual employees. It means great economies in management generally, in advertising, in preventing the running of unnecessary trains, etc. Concentration will not necessarily tend to a complete union of roads throughout the country, but only of those competing among themselves in any one section. It can come only gradually, and meantime legalized pooling is desirable. (490, 496, 497, 499.)

Mr. SPENCER, president of the Southern Railway, likewise believes that consolidation is likely to greatly check discriminations. It may somewhat retard the diminution of railway rates, although the reduction of rates is primarily necessitated by commercial conditions, the necessity of getting products to market in competition with those of other localities. The interstate-commerce law has been more strictly observed by consolidated railways than by others; this is notably the case with the Southern Railway itself, which 5 or 6 years ago consisted of 35 or 36 separate corporations. The average rates have decreased on this system about 7 per cent, although they have not been reduced as much as they would have been, were it not for the fact that the lines had previously been often unable to earn interest. (278.)

Mr. INGALLS, of the Chesapeake and Ohio, thinks that consolidation will not entirely overcome competition, and that agreements between railways are consequently desirable. Consolidation has gone far in New England and the South, and with generally beneficial results; but the witness doubts whether it is practicable to consolidate the great trunk lines between the Mississippi River and the seaboard, on account of the many large local interests involved.

Mr. Ingalls does not think it likely that all the railways of the country will ultimately fall into the hands of two or three great corporations, and believes that such a result would greatly strengthen the movement for Government ownership, which he deprecates. (296, 298.)

In the investigation on trusts, Mr. STETSON, who has acted as counsel in various recent railway reorganizations, testified that they had been rendered necessary by the inability of the corporations to meet their fixed charges, an inability which has been due largely to ruinous reduction of railway rates, partly through legislation and partly through competition. The reorganizations have been made to avoid foreclosure, and also in order to bring in sufficient contributions of cash to improve the property and to wipe out floating indebtedness. Either the property of railways has deteriorated from an inability to make betterments while paying fixed charges, or they have been forced to incur floating debts. Although in some instances the amount of capitalization, including bonds and stocks, has been increased by reorganization, reduction of rates of interest on bonds has decreased the total fixed charges. (See Vol. I, on Trusts, pp. 977, 978.)

Mr. SARGENT, grand master of the Brotherhood of Locomotive Firemen, thinks the consolidation of railways under single management leads to economy in cost of service, and has not injured employees. In some cases, where small roads, paying low wages, have been taken into large systems, the employees have directly benefited. (70.)

Mr. STONE does not think that the forbidding of pooling has a tendency to bring about the consolidation of different lines of road. (538.)

E. Receivers.—Mr. VANLANDINGHAM believes that railroads in the hands of receivers, owing to the fact that they have no dividends to pay, are especially likely to cut rates and to make discriminations. The receiver is usually appointed by the influence of the majority bondholders, and since these bondholders frequently control the stock also, the receiver is apt to be the president of the railroad. The witness does not consider this fact injurious to the interests of the owners of the railroad, and probably not to the general public. It is not usually true that the insolvency has been due to bad management by the officers, but rather to the excessive capitalization. The reorganization after insolvency generally wipes out the original stocks, turning over the property to the holders of the first and second mortgages. (211, 212.)

F. Palace-car and other subsidiary companies (see also *Private cars*, p. 55).—Mr. CALLAWAY, of the New York Central, declares that although the railways have a contract with the palace-car companies to pay them a certain mileage in case the receipts from the cars do not exceed a certain figure, the business on all the important roads is such that the railways really make no payment at all for the use of the cars, and their profits accordingly are not decreased by this system. The attempt of railways themselves to operate sleeping cars has usually been a failure.

The bridge companies, which were formerly common, have mostly been merged into the railway companies, and toll for the use of bridges scarcely exists anywhere. (226, 227.)

Mr. INGALLS, of the Chesapeake and Ohio, says that, while it would be desirable for the railroads to own the sleeping and parlor cars if possible, the operation of through trains, together with the great demand for such cars on special occasions, makes it necessary that they be held by private companies. (302.)

Mr. VANLANDINGHAM, of the St. Louis Traffic Bureau: The so-called "car trusts" result usually from the poverty of the railroads, which makes them unable to buy cars directly. Some of the officers of the railroad form a separate company and build cars, which they lease to the railroad. The proportion which the payments to these "car trusts" bear to the total receipts of railways depends upon the credit and the standing of the railway companies. (309, 210.)

G. Land grants.—Mr. FISH, of the Illinois Central, refers to the fact that that road was granted by the Federal Government, through the agency of the State of Illinois, all the alternate sections of land on each side of the road originally built under the charter. The value of the sections reserved by the Government, which had been only \$1.25 per acre, increased rapidly after the building of the road, and the lands were sold at from \$2.50 up. The railway itself has sold 2,540,460 acres. (328.)

II. FREIGHT TRAFFIC GENERALLY.

A. Policy in fixing freight rates and influences affecting them.—Mr. BLANCHARD, late commissioner of the Joint Traffic Association, points out the very great complexity of the influences which must affect the determination of freight rates. There are often many different railroads reaching the same points, and these roads have unequal facilities, differ in length, etc. Rates are subject to competition between different markets all over the world, to water competition in many cases, and to countless other influences. Changes in the cost of operation and materials, such, for example, as the recent increase in prices of steel and other products, should influence rates. In view of these facts the success of the railways in securing uniform and fair rates, as between different commodities, sections, and places, is very remarkable. Such solutions can only be reached by conferences of railway officers, and it is now the tendency of the law to prohibit such conferences. The broad adjustments of rates which have been reached are quite generally satisfactory. Not one rate in a thousand is ever questioned by anyone. (326, 327.)

Mr. NEWCOMB, of the division of statistics, United States Department of Agriculture, says that there is no such thing as a rate which is excessive in itself. A rate must be compared with rates on other roads and for other products and must be judged by the earnings of the railway. For instance, where a lumber road is built which hauls lumber one way and nothing on the return trip, the rates would naturally be higher than where there are loads both ways. Rates must be classified for different products according to the amount of each shipped, and such classification must differ in different places. (99, 100.)

Mr. Newcomb declares, further, that it is impossible for railways to maintain rates such as to give them more than a normal profit, whether by means of pools, watering of stock, or otherwise. There is always a large amount of traffic which is on the margin of profitable shipment, and the rates must be kept low enough to secure it. Goods come into competition with others from all over the world, under varying conditions of transportation, so that the railways must haul them at such rates that they can be put on the market. (96, 101.)

Mr. CALLAWAY, of the New York Central, says that one of the chief influences affecting rates is the competition of producers in different localities, including, often, competition over the entire world. Even local rates are considerably affected in this way. Thus, if an industry has been established upon the New York Central, that railroad must make such rates that it can compete with some other establishment in the same business on the Pennsylvania Railroad or elsewhere. Unless a railroad looks after the producers along its lines those producers will be driven out of business and ultimately the railroad will be driven out of business. Similarly, the competition of producers in foreign countries makes it necessary to adjust rates to enable domestic producers to do business, and this influence is sufficient to prevent excessive charges in most cases. There would accordingly be little danger of extortionate charges if pooling were allowed among railways. Mr. Callaway illustrates this general argument by reference to his experience in being practically compelled to make special rates on copper from Butte, Mont., to enable mines there to compete with the Chile mines in the Liverpool market. (223, 226, 235.)

Mr. STICKNEY, president of the Chicago Great Western Railway, declares it is impossible by any theory to determine what shall be the just relation between charges for different classes of freight. Judge Cooley held that a reasonable rate must be based on the cost of carriage, but rates never have been so based

and never can be. It does not cost more to haul a ton of first-class goods than one of fifth-class goods, but the rates can not be made the same. Rates must be made such in every case as to secure the traffic. It may be true that any particular commodity already produced must of necessity be moved over a particular railroad and must pay the rate fixed. But there is no necessity that the commodity shall be produced at that place. If rates on wheat from Dakota be made so high that the farmer can not afford to raise wheat he will stop raising it. If a stone quarry is discovered the owner must find out how much he can get for his product at the markets, and he will not quarry stone at all unless he can get railroad rates such as to enable him to do so at a profit. Practically, so-called local rates are always competitive.

Similarly it is impossible to keep rates fixed permanently after they have once been established. As conditions change, rates must change accordingly. Thus, in the case of flour shipments from Minneapolis, the rates must fluctuate frequently with the price of flour. The millers do not expect to make a profit of more than two or three cents per hundred pounds, and small differences in freight rates thus affect them. If the freight rates were uniform the mills could only be run at occasional seasons, especially since the mills seldom have facilities for storing large quantities of flour.

The attempt to maintain steady rates by traffic associations has always failed. Thus the Joint Traffic Association attempted to maintain rates on the trunk lines from 1894 to 1898, but they actually decreased, and even more rapidly than during the two years preceding 1894, which were years of hard times quite as much as those after 1894.

The witness especially deprecates increasing the powers of the Interstate Commerce Commission or of any other governmental body as regards rates. (460-463.)

Mr. EMERSON, a produce dealer of St. Paul, says that special rates are usually made on potatoes and similar bulky classes of produce. A uniform classification is, however, desirable in those cases where the goods are put under a general class. The witness cited instances where special low rates have been given on potatoes and similar products from the Northwestern States in view of heavy crops or other special market conditions, enabling products to be moved, which otherwise would not be. The volume of business in these products in the Northwestern States is much larger now than it was 10 years ago, and the railway rates are considerably lower. (484, 485.)

Mr. BACON, of the Milwaukee Board of Trade, says that the attempt to fix maximum rates for an entire State or section is likely to prove unsuccessful on account of the different conditions. Thus, in Illinois, where the law gives ample power, it has been found impossible to fix a maximum rate, in justice to some roads and to certain conditions, which shall not be considerably higher than the actual rates fixed by the railroads in most other cases. (421.)

Uniform mileage rates.—Mr. DOUSMAN, a grain shipper of Chicago, thinks that freight rates should be practically fixed, not changed from time to time. It is feasible to have uniform mileage rates between different places in the same general section of the country. The witness refers to the declaration of the president of a large Western railroad that that road would like to see its freight rates made permanent, but that each road fears that some other road will get the advantage, and hence tends to cut rates. (359, 361.)

Mr. MORRIS, vice-president of the Atchison, Topeka and Santa Fe Railway, thinks that an attempt to fix railway freight rates on the basis of mileage would have the same effect upon business as a complete revolution in the customs tariff. Moreover, the mileage rate would necessarily have to be very high in order to be fair to railroads in the less populous sections. The time when the uniform rate can be established is very remote indeed. Crop conditions and other temporary circumstances must also be considered in making rates. (498, 499.)

B. Are existing rates reasonable?—1. *Generally.*—Mr. BLANCHARD, late commissioner of the Joint Traffic Association, declares it is not true that American railway rates are made arbitrarily or that they are excessive. The rates have been greatly reduced and the adjustments have been forced by natural laws of competition. There is no absolute standard by which to gauge the reasonableness of rates. The success of American railways in competing with water transportation would seem to indicate that their rates are exceedingly low. (630.)

Mr. COWEN believes that the railway rates in the United States are, if anything, abnormally low. In the central section of the country, he thinks, local rates are almost as low as through rates. On the Southern railways the local rates are higher, but this is justified by the sparse population and light traffic. The great mining and steel industries of Pennsylvania, furnish exceedingly dense traffic to the railways; hence low local rates are possible. (318.)

Mr. RIPLEY, of the Atchison, Topeka and Santa Fe, says that the lines in the East are largely consolidated into a few hands; in New England there are practically only two railroad corporations, and yet there is less complaint there than in any other part of the United States. Things become more settled as a community becomes older; but Mr. Ripley thinks that the great reason for the tranquillity in the Eastern States is that the people along the lines are interested in the railroad properties. (598.)

Compared with the rates in the past, and considering the improved methods of handling business, Mr. MALLORY thinks that existing rates are reasonable. (588.)

Mr. GALLAGHER states that at his mill, in Dallas, Tex., the freight paid on coal is nine times its value at the mine; and he knows of a mill in western Kansas where the freight paid on coal is ten times its value at the mine. (543.)

This question is also touched by many points in paragraph A, above.

2. *Mississippi Valley railroads.*—Mr. FISH, president of the Illinois Central, points out that the statistics show that the reduction in the number of employees during the hard times from 1893 to 1897 was twice as great relatively in the Mississippi Valley as in the other parts of the country. The average rate of transportation is less in the two chief groups of railways in that valley than in almost any other locality. There were more bankruptcies among these railways during the hard times than elsewhere. The witness implies that railway rates have been unduly reduced in that section. The physical condition of the railroads is now as satisfactory as that in the Eastern States, and earlier watered capital has been destroyed by reorganization. (321, 322, 330.)

3. *Decrease in rates.*—Mr. NEWCOMB, of the division of statistics, Department of Agriculture, says that a careful statistical comparison made by the Department of Agriculture shows that the average freight rate per ton per mile throughout the country has declined from 1.9 cents in 1867 to 0.8 cent in 1897. The former figure is probably too low, because statistics were available only from the largest roads, having the lowest rates. The average rate on the Hannibal and St. Joseph Railroad in 1870 was 3.194 cents; in 1897, 0.617; on the Union Pacific Railroad, 3.596 cents in 1869, 0.791 cent in 1897; Chicago, Milwaukee and St. Paul, 2.376 cents in 1865, 1.008 in 1897. On the Georgia Railroad the average rate in 1866 was 3.552 cents; in 1897, 1.112 cents. On the Louisville and Nashville, 3.007 cents in 1867, 0.791 in 1897. All the figures given are those in gold. (108.)

Mr. Newcomb refers especially to the reduction in freight rates on grain during the past forty years. The only case of increase was after the special reduction made in 1890 to relieve the farmers at a time of exceedingly low prices, but this increase did not bring rates back to their former level. The decrease in rates has been greater than the decrease in the price of grain. The average rate per ton per mile on grain in 1896 was only 44 per cent as great as in the years 1867-1872, while the average price of wheat was 67 per cent of the price at the former period, and the average price of other products from 44 to 65 per cent. The rate for all-rail transportation of wheat from Chicago to New York was 39 cents in 1868, 12.5 cents in 1897. The rate for part-rail and part-water transportation from Chicago to New York was 20.76 cents in 1868, 7.37 cents in 1897. In all-water transportation one bushel of wheat would pay for carrying 5.78 bushels in 1868, for 17.25 bushels in 1897. The rates on beef and live stock have decreased from one-third to one-half since 1879. (101, 108.)

Mr. BLANCHARD also compared the existing freight rates with those at earlier periods, to show the reasonableness of the present charges. In 1873 there were 70,368 miles of railway, and the average charge was 2.21 cents per ton per mile for 168,000,000 tons carried. In 1895 there were 179,162 miles of railway, and the average freight rate was 0.839 cent for 763,800,000 tons.

The reduction in dividends of railways also shows how low the rates are. The dividends per mile of railway in 1895 were equal to only 40 per cent of the dividends per mile of railway in 1872. The gross receipts upon each ton of freight moved in 1895 averaged 97 cents, regardless of distance, and 48 cents was the average receipt for each passenger carried. The dividend payments in that year were only equal to 7.2 cents per ton and 3.6 cents per passenger carried. The average rate of dividends on railway capital in 1895 was only 1.57 per cent, while 68 per cent of the entire amount of capital paid no dividends. (630, 631.)

Mr. CALLAWAY, president of the New York Central, thinks that railway rates have been reduced through competition of different kinds to such low figures that further extensive rate wars or serious discriminations between individuals or places will practically be impossible. Thus, on the New York Central the average rate received for hauling a ton of freight has been reduced from 1.88 cents in 1870 to 0.59 cent in 1898. These reductions have been rendered possible by cheaper cost of transportation, through use of larger cars and engines, superior rails, etc. (223.)

4. *Foreign freight rates and service* (see also under *Government ownership*, p. 125 ff).—Mr. VANLANDINGHAM, of the St. Louis Traffic Bureau, does not believe that the freight rates in this country are exorbitant. They average lower than in any European country, although this is not true of local traffic, the average being reduced by the low rates on general traffic. Comparisons are difficult on account of different methods. Thus in England transportation covers delivery to the place of business of the consignee. Wages are very much higher in this country than in Europe. (201, 204.)

Mr. SPENCER, of the Southern Railway, likewise declares that railway rates in this country are reasonable, being cheaper than anywhere else in the world. Although some of the short-haul rates are as high as in other countries, this is necessitated by the small amount of business. Undoubtedly the long hauls of American roads are one element in making the low rates possible. (278, 279.)

Mr. BLANCHARD says that American rates are certainly the lowest prevailing in any country and the service the quickest and best. In 1886 a British writer pointed out that the freight rate on grain and flour from Liverpool to Birmingham, 97 miles, was \$3.01 per ton, while the rate from Chicago to New York, 1,000 miles, was \$5.60 per ton. Another English writer, in 1886, said that the average ton-mile rate on English roads was probably not under 3 cents, which was three times the amount charged on the principal American lines. (630, 631.)

Mr. STONE believes that the facilities for the transportation of persons and of property are much better in this country than elsewhere and that the time of travel is shorter here and the regularity of service is greater. A commission from the Continent, which came here not many years ago to investigate the matter, reported that railroad travel here is much faster. Mr. Stone admits that the fairest comparison would be one between our railroads as a whole and the railroad service as a whole in western Europe, and that he has not seen a comparison made upon this line. He believes that there are more miles of road to the square mile in England and western Europe, and that discriminations are not a serious question there, as they are here. (536, 538.)

C. *Publication of tariffs*.—Professor JOHNSON and Mr. NEWCOMB both declare that publicity of railway rates is the first requisite of regulation. Books and accounts should be subject to inspection, on account of the essentially public nature of railway business. (62, 100.)

Mr. MORTON thinks that the requirement that railways shall post their rates conspicuously in every office is a good deal of a farce and causes unnecessary trouble and expense. Not one intelligent man out of a hundred can ascertain from the published tariffs any one rate within probably 24 hours. It might be possible to publish rates clearly if the attempt were not made to include so many stations. On the other hand, the requirement that rates shall be filed with the Interstate Commerce Commission is eminently desirable and has proved beneficial. The publication of passenger rates as distinguished from freight rates is desirable and not unduly complicated. (491, 493.)

Mr. STICKNEY says that while it is the clear intent of the interstate-commerce act that tariffs of local rates and also of joint rates should be posted in such a way that the ordinary shipper can himself ascertain the rates in any particular instance, the actual carrying out of this requirement is impossible. There are such innumerable railway stations and commodities that it would require several billions of rates to make a complete tariff. Several years ago the Western railways showed the Interstate Commerce Commission their printed tariffs, each having volumes as large as a small trunk, and although they admitted that the ordinary man could not ascertain the legal rate by inspecting these tariffs, the commission did not attempt to require anything further. The witness presumes that the tariffs filed by his own company with the Interstate Commerce Commission include 5,000 or 6,000 sheets. It is true, however, that the ordinary man usually learns the rates on standard products from his own local station to the leading markets. (458, 459.)

Mr. BIRD, general traffic manager of the Chicago, Milwaukee and St. Paul Railway, in reply to these statements of Mr. Stickney, says that the publication of rates with the Interstate Commerce Commission has been decidedly beneficial. The Western railroads as a rule maintain agencies in Washington especially to examine the tariffs of other roads. The courts hold that no tariff can be introduced as evidence in a suit unless it has been duly filed with the commission according to the law. (477.)

Mr. BLANCHARD, late commissioner of the Joint Traffic Association, does not believe that published tariffs are so complicated that experienced shippers and railway officers can not find the rates by means of them. There is not a large shipping firm in Chicago, for example, which does not keep tariff rates in its

office. Most of the large shippers have special traffic managers to look after such matters. (674.)

D. Classification of freight.—1. *General principles.*—Mr. RIPLEY, chairman of the Western Classification Committee, explains that classification is the basis of freight rates. When an article is presented for shipment the classification is examined and the rate upon the article is determined by the class to which it is assigned. Bulk and value are the two controlling features in the classification of freight. Value determines what an article will stand; bulk represents the accommodation furnished by the carrier. Probably the greater quantity of freight consists of articles which are shipped at commodity rates outside of the classification, such as wheat, coal, pork, etc. (568, 569.)

Mr. TUCKER, chairman of the Central Freight Association, states that classification is based on value, bulk, and risk. The question what an article is able to stand, in view of its value, is also taken into consideration. (564.)

Mr. KELLEY, freight commissioner of the Trades League of Philadelphia, considers that the classification of the goods is the basis of the power of the railroads in influencing commodities. The railways at present can fix the final classification of any commodity, and there is no redress except by appeal to the committee of officials which makes the classification. (191.)

2. *Classification committees.*—Mr. RIPLEY, chairman of the Western Classification Committee, states that this committee establishes the freight classification for the roads between Chicago and the Pacific coast. The committee is composed of a delegate from each road, usually the assistant freight agent, sometimes the general freight agent or the traffic agent, sometimes the commercial and general agent. The by-laws of the committee provide for two meetings each year; but it is usually necessary to have an extra meeting. The chairman presides at meetings, decides questions on the construction of the classification in the intervals between meetings, and rules upon new articles presented for classification which are not already provided for. Changes are constantly made at the semiannual meetings, but they are not very numerous. All rulings are operative on the roads in the territory as soon as published. (567, 568.)

Mr. RIPLEY states that shippers have the privilege of appearing before the Western Classification Committee, in person or by attorney, and presenting their cases. He thinks that shippers are generally satisfied with their privileges in respect to the presentation of their desires before the Western Classification Committee. (570.)

Mr. BIRD says that business men and others wishing changes in classifications are permitted to appear before a subcommittee of the Western Classification Committee during some time before the meeting of the association itself. This subcommittee passes on the questions submitted in part and submits the others in due form to the association. Requests for changes are usually made by those who hope to get some special advantage for themselves at the expense of others. (478.)

Mr. TUCKER says that the Eastern Classification Committee is composed of 6 members of the Central Freight Association and 9 others; 15 in all. (558.)

3. *Uniformity of classification.*—Mr. NEWCOMB says that there are at present three more or less uniform systems of classification of freight in this country—one in the Northern and Central States (the Official), one in the Western States, and one in the South. These classifications differ in important respects, a thing which is justified by the differences in the character of the products chiefly hauled. A uniform classification for through freight would be desirable, but there would be too many exceptions as to local traffic. (100.)

Mr. BEAGAN says that the State of Texas has adopted practically the Western classification, but has prohibited the railways from making certain reservations exempting themselves from liability. (350.)

Mr. RIPLEY, chairman of the Western Classification Committee, says there are three principal classifications in the United States—the Official, which covers the territory east of Chicago and the Mississippi River and north of the Ohio; the Southern, which governs south of the Ohio and east of the Mississippi, and the Western, which governs from Chicago to the Pacific coast. If freight is shipped from New York into the territory of the Western classification, through Chicago, it is rebilled under the Western classification. This is not uniformly true, however. For instance, freight from points east of Chicago consigned to St. Paul or Mississippi River points goes through on the Eastern classification. Mr. Ripley does not think that difference of classification is a source of much inconvenience to the shipper. It does, however, produce some unjust discrimination between places. For instance, a shipper in Chicago, sending to St. Paul or to Mississippi River points, is likely to be at some disadvantage as compared with an

Eastern shipper sending similar goods to the same points. This is because the Eastern classification is, upon the whole, somewhat lower than the Western. Many complaints on the part of shippers arise from these differences of classification, and often delay is caused in the delivery of freight. The witness has not known of any suit arising from such a cause.

In Illinois there is a classification framed by the Illinois board of railway and warehouse commissioners. Of course this applies only to business wholly in the State of Illinois. (568, 569.)

Mr. BRID, of the Chicago, Milwaukee and St. Paul Railway, explains the reason why the Eastern or Official classification has been applied by the Western railroads as far as the Mississippi River. It was used by the railroads running directly from Eastern points to the Mississippi River, and roads from Chicago were forced to adopt the same classification on through traffic in order to compete in handling the goods. Thus, in one instance, the witness found that whisky was being shipped from Cincinnati to St. Paul at less than the rate from Milwaukee to St. Paul, whisky being fourth or fifth class at Cincinnati and first class under the Western classification.

The witness was a member of the committee which attempted to establish uniform classification throughout the country. Each section has made its classification with a view to promoting business and building up manufacturing in its own territory. Consequently each section must yield something to the other to secure uniformity; it is a matter of giving and taking. This committee prepared a classification which was agreed to by the roads west of Chicago and by several Eastern lines, but it was defeated by the vote of one or two of the trunk lines. Even if this uniform classification had been adopted, special commodity rates on grain, lumber, coal, etc., would still have been permitted, just as they are at present. (477, 478.)

Mr. KNAPP, of the Interstate Commerce Commission, believes that uniform classification of freight under public authority would lessen discriminations and be generally beneficial. The desirability of uniformity comes not so much from the difference in absolute expense of shipment of a given commodity under different classifications as from the fact that its relation to competing commodities is largely determined by classification. Thus the differences in rates between wheat and flour, referred to in another connection, are exceedingly important in their influence upon the milling business. (142.)

Mr. DICKINSON, of La Crosse, Wis., a manufacturer of agricultural implements, testifies that he has suffered serious injustice as a result of the differences between the existing classifications. For instance, under the Official classification, which rules in Michigan, certain sizes of packages of vehicles are shipped as first class. Under the Western classification, which governs in Wisconsin, practically all vehicles, except those of large and bulky structure, are shipped at 1½ times first class. The classification at the initial point of shipment controls the rate to destination. From this it results that while a shipper of vehicles in Wisconsin has to pay 1½ times first-class rates, a shipper in Michigan can reach the same points by payment of first-class rates only. Again, trouble arises from the different requirements as to packing. Under the Official classification cutters may be shipped in crates, set up, with the bows projecting, and without wrapping the projecting parts; under the Western classification the bows must be wrapped or a higher rate is charged. The railroad companies have also made a special ruling on buggies, which enables the Michigan manufacturers and the manufacturers in Chicago, Milwaukee, and Racine to ship vehicles to Iowa points at a rate that is sometimes even less than the first-class rate. Mr. Dickinson is obliged to pay 1½ times first class on the same commodity to the same points. He considers this a gross injustice. He admits that there might be a particular instance in which a strictly uniform classification might work hardship, but, taking the country as a whole, he believes that the uniform classification would be the proper and right thing. He does not think that uniformity of classification can be hoped for except through governmental action. (548.)

Mr. Dickinson states further that the manufacturers in the West are dependent on commodity rates to put them in a position to compete with manufacturers farther east. He finds, however, that his own town is put at a disadvantage in respect to these rates as compared with St. Paul. The commodity rate on the witness's raw material, mostly iron and steel, is about one-half of the rate from Chicago to St. Paul on the finished product, but as it takes about two carloads of raw material in the rough to make one of finished product, this amounts to a discrimination against La Crosse. (550.)

Mr. RIPLEY is in favor of a uniform classification of freight for the whole United States. It should be framed by the railroads. The roads made an

attempt some years ago to frame such a classification, and practically agreed upon it; but the agreement failed through the objection of a few roads. The objecting roads were principally in the East, although some of the Pacific coast lines also objected. The witness thinks that the trend of the changes which are made from time to time in the Western classification is toward uniformity. The framing of a classification is a very complicated matter, and it is doubtful whether one made by the Interstate Commerce Commission would give general satisfaction, at least at first. The classification which all the roads drew up some time ago, however, would be available as a basis. The witness would not anticipate any injury to the roads by a classification framed by the commission after a full hearing. It is perhaps hardly possible that a uniform classification will be attained, unless the framing of one is put into the hands of the Interstate Commerce Commission, or it is made mandatory upon the railroads to frame one. (568-570.)

Mr. MORTON believes that the universal classification is very desirable. He was a member of the committee appointed with a view to such classification. The attempt failed, because men in different sections desired different classifications on account of the commodities most largely carried in their sections. The witness thinks it would be to the interest of the railroads and of the public that some commission, perhaps under the supervision of the Interstate Commerce Commission, should fix a uniform classification. It would still be possible for different rates to be made upon the same classification, and for special commodity rates to be made as at present. (491, 496, 497.)

Mr. INGALLS, of the Chesapeake and Ohio, declares that differences in classification cause an immense amount of trouble. He thinks that uniform classification would not necessitate making the same rates in every section. (300.)

Mr. BLANCHARD, late commissioner of the Joint Traffic Association, declares that he is in favor of uniform classification so far as it is practicable. The railways themselves ought to formulate classifications. Assignment of articles to classes is a very important element in deciding what the rate on those classes shall be, and the railways should determine these classes for the same reason that they should determine the original rates. It might be wise to permit the Interstate Commerce Commission to order the railroads to adopt a uniform classification by a certain date, leaving it to the railways themselves to work out the classification. In case of failure to adopt a classification, the commission might perhaps put one in force.

At the same time the importance of uniform classification, Mr. Blanchard thinks, has been overestimated. Its adoption would not stop discriminations. The chief advantage would be in securing unbroken through rates. Moreover, there are many difficulties in the way of uniform classification. Despite these difficulties, however, the number of classes has been greatly reduced, as well as the number of classifications. The eastward tariffs of the Central Traffic Association formerly contained 13 classes; these have been merged into 6, exclusive of commodity rates. (693, 676, 677.)

Mr. Blanchard says further that there are many reasons which warrant differences in charges and in classifications in different sections of the country. In a section where there is a large and regular traffic in some one commodity, such as cotton, live stock, or manufactured products, it is proper that a lower rate should be made on that commodity than in a section where the traffic is very light. Thus, the large concentration of manufacturing industries in New England justifies lower rates on manufactured products from that section than in the regions where manufactures are little developed. Other items in the classification must be affected by canal, ocean, and river transportation. This is especially true as to transcontinental traffic. On account of the numerous influences which affect the transportation of commodities in different sections, it is necessary to have special commodity rates intermediate between the various classes. It is desirable that these should be reduced in number as far as possible, but they can not be entirely done away. Moreover, to establish uniform classification for interstate traffic would also necessitate changes in regard to State traffic. The present classifications have been adopted in view of the circumstances and conditions in their respective regions. The system of freight classification in England and on the continent of Europe is, roughly speaking, similar to that in this country. (682-694.)

Mr. VANLANDINGHAM, freight commissioner of the St. Louis Traffic Bureau, does not think that a uniform classification by statute is advisable or even possible without many exceptions of particular commodities. The territory in which an article is produced in large quantities must naturally have a lower rate on that article to the central market than prevails in territories where it is carried

in small quantities. Water transportation also makes modifications in classifications necessary; in Pacific coast traffic there are nearly 1,500 exceptions to the general classifications. The railways themselves are seeking uniformity in classification as rapidly as possible. There were fully 20 different classifications fifteen years ago. The classification committees of the different sections meet yearly, and often have hundreds of applications for changes. One difficulty encountered by the railways in trying to get uniform classification, which would also arise in trying to fix a uniform classification by national authority, grows out of the classifications prescribed on particular commodities for traffic within various States by statutes of those States, as in Illinois.

The Official classification has only six classes; the Western is much higher on general merchandise, and lower on the products of the country; the Southern is more largely based on quantities than on the value of goods, on account of water competition. (202-204.)

Mr. SPENCER, president of the Southern Railway, believes that greater uniformity of classification than now exists is desirable, but regard must always be given to the different conditions in different sections. Classification amounts to the fixing of rates. Many articles have been taken out of the regular classes and given special commodity rates. Thus in the State of Alabama as soon as the iron business was introduced and largely developed it became absolutely necessary to make a special commodity rate for iron, such as was not necessary before. The railway must thus always consider local conditions, must take into account the markets to which local products can go, and the prices which can be obtained. While the original theory in fixing classification was probably to impose all the traffic would bear, the method is now to constantly whittle away rates according to constantly changing conditions. (277.)

Mr. COWEN, of the Baltimore and Ohio, thinks that uniformity in classification is out of the question for a country so large and with so great a traffic as the United States. But the railways themselves are tending to secure uniformity as far as possible. (317.)

Mr. CALLAWAY, president of the New York Central, does not understand all of the reasons for differences in the classification of commodities in different sections of the country, but admits that there are differences in conditions. (337.)

Mr. KELLEY, of the Philadelphia Trades League, believes that on the whole a uniform system throughout the country would be very desirable, although it would take a considerable time and much labor to prepare one, and although there are often reasons why classifications should differ somewhat in different territory. At present, under the three classifications which prevail in different sections, the shipper, who can not be familiar with them all, or even with a single classification, on account of its complexity, does not know when he ships goods what the freight to some distant point will be. Shippers themselves, rather than buyers, usually determine the route of shipment. The witness believes that, individually, railroads do not depart materially from the general classification adopted for their respective sections of the country. (191.)

E. Miscellaneous questions.—1. *Through freight rates.*—Mr. BLANCHARD testifies that through freight rates and fares were formerly made by adding up the various local rates with the terminal charges, etc. The rules and responsibilities of the different carriers forming the links in the through lines were dissimilar and even clashing. Transfers were numerous and the time of through transit very long. At present through routes have been arranged either by actual consolidation of ownership or by joint agreements of different kinds, and now more and better through routes are offered to shippers in this country than in any other. The result has been economical to the railroads in car supply and return loads, and advantageous to the general public in quicker time and lower charges. It is not necessary to pass laws to induce railways to make proper through connections. The self-interest of the carriers themselves will regulate the matter. At present any road, which can offer reasonable facilities and which will divide charges as satisfactorily as existing connecting lines, can usually secure through rates from any important railroad connecting with it. It is true that railways sometimes have preferences for particular roads. Thus a group of roads under common ownership will naturally tend to prefer one another in their shipments. So, too, if one connecting line has a reputation for demoralizing rates and injuring both shippers and carriers it will naturally be less favored than more conservative lines. (327, 332.)

2. *Fast freight lines.*—Mr. NEWCOMB, of the Department of Agriculture, says that there are many lines of freight cars going by special names which traverse two or more lines of railways. Their purpose is to secure a reputation or trade name for through traffic. Through traffic arrangements of some sort are absolutely essen-

tial. There were formerly some fast-freight lines which were incorporated and separate from the railways, but the Empire Line and the Merchants' Despatch are the only ones of this kind now. Others are merely cooperative arrangements among connecting roads. Each puts in a number of cars and pays expenses and divides receipts in proportion to its mileage. The railway companies consider the separate, incorporated fast-freight lines disadvantageous. (98.)

3. *Competition of Canadian railroads* (see also under *Grain shipments*).—Mr. MORRIS, vice-president of the Atchison, Topeka and Santa Fe Railway, complains of the fact that the Canadian Pacific Railroad is permitted to carry freight from one State in our Union to another through the Dominion of Canada, and especially of the fact that it demands that the American transcontinental lines shall charge 10 per cent higher rates than the Canadian road. He thinks that this practice should be prohibited by law. (492.)

Mr. PROUTY, of the Interstate Commerce Commission, referred to the practice of permitting goods to be carried by the Canadian railways from one part of the United States to another in bond. The practice is opposed by those railways which do not participate in the traffic brought by the Canadian roads.

4. *Export of butter and cheese*.—Mr. KENNARD, of the Chicago Butter and Egg Board, says that the export trade in butter and cheese is quite large, amounting to millions of dollars yearly, but that it is hindered by lack of shipping facilities and is not increasing in amount. There is only one steamship line from New York which will carry shipments of butter, and the freight rates on this line are almost prohibitive. Chicago dealers ship largely by way of Montreal, the freight rate being only about one-half that from New York. Owing to these lower Canadian rates the exportation of butter and cheese has developed enormously, although the witness does not know how far the statistics distinguish between the product made in Canada and that shipped through Canada from the United States. The shipments of cheese from Montreal from May 1, 1899, to November 1, 1899, were about seven times as great as those from New York, and the shipments of butter about four times as great. The Canadian steamers would only take American products when they can not get the products of their own country, and they keep their freight rooms open, excluding American products, up to within three days of sailing. Mr. Kennard thinks that American shipping should be encouraged in order to remedy this difficulty. (368.)

5. *Weight of shipments*.—Mr. EMERSON, a produce dealer of St. Paul, says that shippers of bulk vegetables, especially potatoes, frequently have difficulty on account of the apparent shrinkage in weights. Where these dealers ship to other persons the lack of proper supervision by the railroad after the discharge of the freight sometimes permits part of the goods to be taken away, either by accident or intentionally, without being weighed. The goods are paid for by the discharge weight. In other cases on shipments made to the dealer the car is found to contain less weight than the amount billed by the person loading it, but the consignee is compelled to pay freight at the higher rate. In the case of potatoes there is naturally a slight shrinkage, chiefly due to the evaporation of moisture, but it should not exceed two per cent, whereas some of the discrepancies which the witness has met with have been much larger. The difficulty of lack of supervision over the discharge of cars is found chiefly in medium-sized markets. The witness thinks it would be possible for the railroads to exercise proper supervision without employing many more men; at any rate, shippers would be willing to pay for necessary supervision. Where potatoes and similar articles are shipped in barrels instead of in bulk, little difficulty occurs.

In this connection the witness declares that the track scales used by the railways are often inaccurate. He has weighed the same car on the same day on the scales of two different railroads at St. Paul and found a difference of nearly 3,500 pounds. (480-485.)

Mr. KENNARD says that great inconvenience is caused to dealers by the different weights fixed for bushels of different products in the various States. Sales of all sorts of products should, if possible, be made by weight instead of measure. (369.)

6. *Perishable products*.—Mr. KENNARD, vice-president of the butter and egg board, successor of the Chicago Produce Exchange, says that that board meets daily to give opinions and to vote on the market price of butter and eggs and to consider the interests of business. Many of the members are interested in the handling of other perishable farm products. There are about 200 or 250 firms in Chicago in these general lines. These dealers use refrigerator cars largely, and are charged very high rates. In the case of fruit products, for example, in addition to an extra freight rate for the use of refrigerator cars, there is a charge for icing, which the dealers think should be omitted. (363.)

MR. EMERSON complains that the increase of the minimum carload of fruit from 50,000 pounds to, he thinks, 25,000, compels the loading of cars almost or quite to the roof. The result is injurious to the product, because of the generation of heat and of its tendency to rise to the top of the car. Potatoes are often injured from the same cause. (482, 488.)

7. *Terminal charges, live stock, Chicago.*—MR. MALLORY states that a charge of \$3 per car on live stock sent to the Union stock yards at Chicago was added to the regular tariff on June 1, 1894, and is still collected by all roads. The excuse for the imposition was that on the same day the Union Stock Yards and Transit Company, which owns tracks in and about the stock yards, imposed a trackage charge of 80 cents per car upon most of the roads and \$1.50 per car upon others, which used the company's tracks for a longer distance. This is aside from the charge made to stock owners by the stock-yard company for feed and yardage. By the decision of various courts and commissions, the terminal facilities must be furnished by the railroads and must be included in their rate. Consequently any charge for them must be entirely separate from the charges which shippers have to pay to the stock-yards company. The live-stock exchange took the matter up with the Illinois Board of Railroad Commissioners, and obtained a decision that the terminal charge was unjust, unreasonable, and illegal. The matter was afterwards taken to the United States court in Chicago and a similar decision was obtained; the railroads were ordered to desist from making the charge, and they did so until the court of appeals reversed the decision of the lower court on a technicality. Complaint was made to the Interstate Commerce Commission, and the commission, after a full investigation, ordered the railroads to cease collecting the charge. The railroads refused to obey the order. The commission appealed to the United States court to enforce the decision, and at the time of Mr. Mallory's testimony the court had the case under advisement.

The Cattle Growers' Association, which is the largest association of its kind in this country, and is composed largely of Texas, Montana, and other range people, has joined the Chicago live-stock men in their fight. (587, 588.)

8. *Chicago Belt Railroad.*—MR. GREELEY says that the usual charge for transferring grain around the Chicago Belt Railroad is about \$3 per car, which he considers excessive. He does not know concerning the power of the Interstate Commerce Commission in regard to this railroad. (381.)

MR. VANLANDINGHAM refers to the abuse of the belt-line system around Chicago for the purpose of making discriminations in favor of that city and of particular shippers. The allowances made by the trunk lines to the belt lines for handling their cars have been so large that the belt lines have been able to make large rebates. The belt lines claimed not to be amenable to the interstate-commerce act. The Interstate Commerce Commission, however, has ruled against this practice. (208, 209.)

9. *Furnishing of cars.*—MR. CALLAWAY states that his own and other railways sometimes find it difficult to furnish cars to shippers promptly. He admits that railways ought to be compelled to take care of their customers, but declares that the inequality of the business at different times makes complete supply of the demand occasionally impossible. (232.)

10. *Express companies.*—In the opinion of MR. INGALLS, of the Chesapeake and Ohio, the earnings of the express companies are not increasing relatively to those of railways, especially those of the fast freight trains which the railways are running. He believes that on the Chesapeake and Ohio the earnings of the companies amount to only about 1 per cent of the freight receipts. (801.)

11. *Freight bureaus.*—MR. KELLEY, president of the National Association of Freight Commissioners, and freight commissioner for the Trades League of Philadelphia, testifies that there are about 25 freight bureaus in the different States similar to the Trades League of Philadelphia. This consists of merchants organized for the purpose of furthering the mercantile interests of the city by securing fair rates of transportation to and from the city. The freight bureau acts as the mediator between the transportation companies and the members of the association in case of grievances, and also furnishes advice to shippers. The Philadelphia bureau, for example, has presented a number of grievances and has succeeded in having Philadelphia shippers and merchants placed on a parity with those of other cities. The railway companies usually give fair consideration to questions raised by these bureaus, knowing that they represent probably the major proportion of the shipping interests of their respective cities, and that they are familiar with the subjects discussed.

The National Association of Freight Commissioners has for its purpose the discussion of matters of transportation of a national character, the presentation of resolutions to Congress, etc. It has an executive committee, which takes up

important matters during the intervals between the national conventions. (185, 187, 193.)

Mr. VANLANDINGHAM, of the St. Louis Traffic Bureau, similarly points out that such bureaus are able to influence railway officials materially. The usual method of action is to visit the traffic officer of the railway company and confer with him informally. He will often be much more frank than if the investigation were a public one, and the fact that the representative of the traffic bureau is familiar with railway matters, so that he is not forced to believe all the arguments of the traffic manager as he pleases to give them, and that he has behind him the moral influence of a large body, enables him often to secure important changes. (208.)

III. DISCRIMINATIONS BETWEEN INDIVIDUALS.

A. Existence of discriminations.—1. *General affirmation.*—Mr. KNAPP, Mr. PROUTY, and Mr. CLEMENTS, members of the Interstate Commerce Commission, all agree in the opinion that numerous and secret discriminations are still made by railways, notwithstanding the interstate commerce act, although there has, in their opinion, been a marked improvement during the past year. They attribute these discriminations to competition between carriers, and the attempt to secure business in whatever way is possible, rather than to a desire to injure or favor any shippers. It is poverty which leads to dishonest action.

Mr. PROUTY declares that he has no doubt that during 1898 the demoralization of rates by discriminations was about as bad as it could be. Competitive traffic did not pretend to move on the published rates. At Portland, Oreg., it was found that large shippers telephoned to the agents of the different railways, got the best rates possible, billed their goods at the published rates, and afterwards received the difference. This witness also points out that railways in the hands of receivers have been among the most serious offenders, although since about the beginning of 1899 the courts appointing receivers have been more strict in keeping them within the law.

Mr. KNAPP, especially, believes that since the action of the receivers of the Baltimore and Ohio Railroad in the latter part of 1898, in acknowledging the extensive practice of discriminations and agreeing to aid in the future in preventing them, there has been a very marked improvement of conditions. The managers of many railroads had become impressed with the danger to their finances from the reduction of rates to many special shippers. They believed that, since practically all railways made these special rates, no one really gained largely in traffic. Moreover, rates at first granted secretly tended afterwards to become published rates, at less than profitable figures. The Baltimore and Ohio Railroad simply took the initiative in a movement favored by many other railways, especially of the Northeast. This changed attitude of the railways, together with the increased amount of traffic and with the narrow margins which now remain for making concessions, has, in the opinion of Mr. Knapp, largely done away with direct discriminations on the trunk lines, although grain for export, packing-house products, and some other classes of traffic are perhaps still subject to discriminating rates.

Mr. PROUTY, however, declares himself less optimistic as to present conditions regarding rates, and Mr. CLEMENTS implies that he considers discriminations between persons, as well as between places, to be still a serious evil. (Knapp, 132, 139, 142, 143; Prouty, 150-152; Clements, 159.)

Mr. COWEN, president of the Baltimore and Ohio Railroad, says that the letter written by him and Mr. Murray to the Interstate Commerce Commission in 1898 was occasioned by the great reduction in the revenues of that railway from the secret cutting of rates. The granting of rebates and lower rates affected a great deal more than 50 per cent of all the traffic at that time. All packing-house products and iron and steel products were getting cut rates. The system is contrary to the public welfare and injurious to the railways. Excessive competition and open rate cutting are the chief causes leading to discriminations. All sorts of methods were being employed. There is much less abuse in this way at present, but the witness fears that when the great demand for transportation again falls off new discriminations will be made. Pooling is the only remedy. (313-316.)

Mr. BLANCHARD, late commissioner of the Joint Traffic Association, says that the practice of granting discriminating rates differs in extent at different times and in different sections of the country. The actual amount is difficult to ascertain, since the offending companies never divulge their actions to anyone. The witness believes, however, that discriminating rates have increased steadily since about the first year after the passage of the interstate commerce act, and that

they will continue to increase in the absence of pooling. Throughout his argument in favor of pooling the serious character and results of discriminating rates are repeatedly referred to. (625, 626.)

Mr. Blanchard declares further that it is usually the shippers who demand rebates, and threaten to transfer their patronage to other lines, rather than the railway companies which solicit traffic. The railways have no desire to build up large shippers. (683, 684.)

Mr. INGALLS, president of the Chesapeake and Ohio, also says that the practice of granting discriminations in favor of individuals has varied greatly at different times. Thus in 1885 there were many discriminations. The interstate commerce act checked them for a few years, but they increased until in 1894 and 1895 the evil was about as bad as possible. During 1896 competing railways made joint agreements which almost prevented discriminations, but the decision of the Supreme Court in the trans-Missouri case under the antitrust act caused anarchy in railway rates. The conferences between the Interstate Commerce Commission and the railways have resulted in a great improvement, but Mr. Ingalls fears that when the present rush of business has ceased the railways will gradually drift back into their old ways until they are permitted to form agreements. (286, 297.)

Mr. FISH, of the Illinois Central, also speaks of the decrease in discriminations due to the conferences with the Interstate Commerce Commission, to abundant traffic, and to the consolidation of railways. (336.)

Mr. SPENCER, president of the Southern Railway Company, believes that discriminations in favor of individuals are still largely granted by the railways. The object is to get business without enabling competitors to find out how it is obtained. If the law were obeyed which requires rates to be made known, and three days' notice of reduction to be given, the competitor would have the same opportunity to make bids for traffic. The evil takes many forms, including direct rebates, commissions, car mileage, underbilling, and billing to the wrong destination.

Mr. Spencer declares, however, that the Southern Railway is not making any discriminations between individuals, aside from the general difference between carload rates and part-carload rates. This was not true of the separate lines which were consolidated a few years ago into the Southern Railway, and the witness thinks that consolidation generally tends greatly to reduce discriminations. Throughout the South rates are much more uniformly maintained now than five years ago. Shippers have confidence that other shippers are not getting advantages, and hence do not themselves apply for advantages. (273, 279.)

Mr. BIRD, of the Chicago, Milwaukee and St. Paul, also testifies that railway rates are not maintained as the law requires, but believes that the number of instances of violation is much less than is generally supposed. However, on account of the severe penalties, the railways are apt to confine their discriminations to the largest shippers, who will help them in concealment, and these shippers need favors less than the others. Generally speaking, a large volume of business tends to steady the rates. (470, 471.)

Mr. HYLAND says that there is no necessity for railroads to make private discriminations in order to compete. Only three days' notice of reduction in rates made for the purpose of securing business is required by the law. Mr. Hyland declares that the long and short haul clause of the interstate-commerce act is especially important and should be strictly enforced. Railways should be willing to give up any part of their traffic which can not be carried on legitimately. (352.)

Mr. STICKNEY, president of the Chicago Great Western Railway, declares that published tariffs are not maintained by railroads and can not be maintained. Moreover, he does not think that uniformity of rates between different shippers is natural or necessary. The producer of transportation, like the producer of other commodities, should be free to sell for all he can get and to make different prices to different persons if necessary. "If I was a banker and found a merchant that had an idea that somebody had to buy his goods I would not allow him to do business at my bank." It takes two to make a bargain. Mr. Stickney discusses quite fully the conditions which must be considered in making freight rates, his evidence on this subject being summarized in another place. (460-462.)

Mr. MORTON, of the Atchison, Topeka and Santa Fe Railroad, thinks that discriminations, whether between individuals or localities, should be prohibited. There certainly do exist unjust discriminations of both classes, although it is not always easy to decide what are fair rates as between different communities, and what constitutes discrimination. A man who ships a single carload should receive as low a rate as one who ships 100 carloads.

The witness thinks that preferential rates are probably given on as large a proportion of the business as before the interstate-commerce act, or even larger, although the number of persons who receive these rates is smaller. Practically

all the methods which human ingenuity can devise are employed to evade the law. Frequently lower rates are granted on shipments within a State as compensation for furnishing interstate shipments. If a single railroad believes that the interstate-commerce act is a farce, and makes special rates, its practice goes far toward demoralizing the rates of other roads. The witness declares that there is one railroad from Chicago to the Missouri River which is doing double the business it ought to do if it maintained rates. A few years ago a number of railroads in that section tried to maintain absolutely the interstate-commerce law, and brought suit against this particular road. Its president admitted the charges, but nothing was done. (490, 493, 494.)

Mr. KELLEY, freight commissioner for the Trades League of Philadelphia, is of the opinion that rates have been better maintained during the year 1899 than before. He attributes this less to the fact of the abundance of traffic, which does not in the past seem to have prevented discriminations, than to the conferences between the Interstate Commerce Commission and the trunk line officials. Discriminations by false classifications, private cars, and similar methods still exist. (185, 186.)

Mr. VANLANDINGHAM, commissioner of the St. Louis Traffic Bureau, believes also that published rates have for the most part been maintained during 1899, but that the discriminations during 1898 were worse than at any time during the past quarter of a century. They were made by numerous methods, such as payment of commissions for securing business, allowance of direct rebates, transportation of grain on export rates when really intended for domestic use, allowances to elevator owners for loading and unloading, payments for the use of private cars, etc. (191.)

Mr. Vanlandingham further declares that in his position he learns of many illegal discriminations between individuals, perhaps as many in favor of individuals whom it is his interest to protect as in favor of others. He believes that usually such discriminations in favor of individuals in one city are made by railways in the belief that they would otherwise lose business by reason of discriminations made in favor of some other place or individual. He thinks that the evil of discriminations is likely to get worse and worse, until it becomes so great that the railways will agree to put things back to the proper basis again. (207, 208.)

Mr. DOUSMAN, a grain shipper of Chicago, testifies that he frequently received rebates on grain shipments before the interstate-commerce act. Since that time, his opposition to freight discriminations being well known, he has scarcely been offered rebates and certainly would not accept them. On this account he has practically been driven out of business. The witness believes from his experience that discriminations are worst when there is the most traffic to move. Discriminations were temporarily checked when the interstate-commerce law went into effect, but gradually increased and have continued ever since. Place discriminations of all kinds are especially deprecated by this witness. The practical effect of the interstate-commerce law has been to lessen the number of persons to whom railroads grant favors, but probably not to lessen the amount of such favors. With every man on the same basis all danger from large combinations of capital will disappear. (353, 359.)

Mr. NEALL, a shipping merchant of Philadelphia, believes that discriminations still exist. He even thinks that they are justified in certain cases in order to offset discriminations between places made legally under the tariffs. Thus, Philadelphia has repeatedly complained that the freight rates on the trunk lines to that port are relatively higher than to other ports, so that traffic is diverted from Philadelphia. The only way in which the railways, which are under agreement as to differential rates to different ports, can do justice to Philadelphia is by making discriminations in favor of individuals at that city, and Mr. Neall is inclined to think that the fact that Philadelphia has been receiving a fairer proportion of freight during the past year than hitherto is largely due to the existence of such individual departures from published tariffs. Mr. Neall admits that the harbor of Philadelphia is not equal in some regards to those of other ports.

In view of the discriminations which exist among railways Mr. Neall advocated pooling, under proper restrictions and under the supervision of the Interstate Commerce Commission. (173, 174.)

Mr. STONE, of the Chicago Board of Trade, thinks there is generally less complaint of discrimination when business is good than when it is bad. At the present time he believes that there is less unjust discrimination than there has been during the last four or five years, and perhaps during the decade just closing. In a place like Chicago or any large city he thinks the merchants are more alert than people in smaller places, and there is not apt to be so much discrimination between them. Railways would be more cautious about allowing discrimination where public opinion furnishes such a search light than they would

be in a community dominated by one large business. He has no information about local discriminations between great cities like Chicago and smaller places. He does not believe pooling would prevent unjust discrimination. (534, 535.)

Mr. WOFFENDIN, chairman of the Chicago east-bound freight committee, thinks it quite probable that there is a good deal of freight discrimination, but he has no means of knowing it. He is of opinion, however, that the public rates are now so low that any lower discriminating rates would involve a loss. (565, 566.)

Mr. GALLAGHER is inclined to think that there is less discrimination in the trunk-line territory than in the West; at least, not so much is heard about it. (545.)

2. *Denial of discriminations.*—Mr. TUCKER, chairman of the Central Freight Association, says that there never was a time when there was less rate trouble than now. He thinks that as a rule more has been said about rate troubles than has been justified. He does not know of any discriminations, and he does not think any discrimination could long continue without being known to everybody. It is natural for a shipper to feel that he is not getting as low rates as others, but Mr. Tucker thinks he is mistaken as a rule. He does not think there is any case in which large shippers get advantages over smaller ones; though, of course, a man that is a large shipper and does a large wholesale business, like several packers or large grain men, naturally have more power than the smaller dealer. That is exemplified in almost every commercial transaction."

It is, of course, possible that there might be a system of drawbacks without its being publicly known. If, as stated, the Santa Fe paid \$7,000,000 in drawbacks in the years preceding its bankruptcy, that was not known at the time to the other roads. Mr. Tucker thinks, however, that the other roads would have known if the Santa Fe had got a greater tonnage than it would otherwise have got. He does not think that any pirating of rates can result in increased tonnage, because it will soon be met by a competitor. (558-561.)

Mr. CALLAWAY, of the New York Central, thinks that the freight rates have been reduced to such a low figure that considerable discriminations between individuals are impossible. He implies that special rates to certain shippers, not necessarily more favorable than those to other shippers on the same line, are sometimes made to enable those shippers to compete with producers on other lines of railway and even in other countries. The private-car system constitutes a form of discrimination, although the rates are open to all such shippers. The witness admits, also, that pooling would be somewhat beneficial in its influence upon discriminations. (251.)

Mr. Callaway is positive that the New York Central adheres strictly to published rates at present. He had not understood that extensive rebates were distinctly proved against the Atchison, Topeka and Santa Fe Railroad. (231.)

Mr. EVANS, a miller of Indianapolis, thinks that there has been very little discrimination between individuals in regard to the shipment of grain products. Practically all shippers have paid published rates. (440.)

Mr. EMERSON, a produce dealer of St. Paul, thinks there are probably no discriminations between different shippers in handling vegetables and similar products in connection with that market. (484.)

Mr. MALLORY believes that the rates on live stock are exactly the same to all shippers. The great packers, who own cattle cars, have an advantage to the extent of the profits the cars bring them; but he believes that they have to pay the same tariff rates as others. (588, 589.)

3. *Specific instances of discriminations.*—Mr. GALLAGHER states that he has all the documents to prove a shipment of grain from Minnesota to Texas at a rate very much less than the published tariff rate. (542.)

Mr. FULLER, of Norfolk, Nebr., says that he knows of instances where jobbers in that city have received rebates from the published freight rates. One leading dry-goods firm has assured the witness that it secures a rebate of 25 per cent. A wholesale grocery house did business at Norfolk on the basis of 25 per cent rebate, and abandoned its business when this rebate was withdrawn. The Chicago, St. Paul, Minneapolis and Omaha Railroad at that point does not publish its tariff in the office, but claims to comply with the law by posting a card stating that the tariff rates can be ascertained by applying to the agent. The witness also refers to other railway practices which he considers unjust. (442, 443.)

(See also *Discriminations against St. Louis*, p. 65.)

4. *Standard Oil Company.*—Mr. PROUTY, of the Interstate Commerce Commission, testifies that, while the Standard Oil Company perhaps receives no direct rebates or discriminations, it is favored in various ways by the railroads. These are cited as illustrations of the methods by which, under the law, inequalities may still exist, as between different shippers. Thus the freight rate from Cleve-

land to Boston was formerly 22 cents per hundred pounds alike on iron articles, grain, and petroleum. But since the interstate-commerce act the rates have been changed, so that the rate on grain is 15 cents per hundred pounds, on iron 20 cents, and on petroleum 24 cents. Again, on almost every commodity through rates are made from Cleveland and other Western points to points reached by the New York, New Haven and Hartford Railroad. On petroleum there are no through rates, but a local rate is added to the Boston rate. Moreover, the New York, New Haven and Hartford Railroad prescribes that petroleum and its products shall be in the second class of freight unless the person to whom it is shipped has a private siding or tank opposite the rails, in which case it is fifth class, the rate for fifth class being probably one-half that for second class. These arrangements, the witness believes, are explainable by the fact that the Standard Oil Company ships oil from its seaboard refineries to Boston largely by tank steamers, and distributes it from there for a comparatively short distance at the local rates. The railroad can, to be sure, make more money by transporting on the local than on the through rate, but there is no justification for denying the through rate to one particular commodity. There is no power now, however, to prevent such discriminations.

Mr. Prouty also refers to the differences in rates between shipments from Cleveland to New Orleans, and from Whiting, near Chicago, to New Orleans. Whereas the average rate on about 25 articles is about 2 cents higher from Cleveland than from Chicago, the rate on petroleum is 8 cents higher. The Standard Oil Company is the only shipper of oil from Whiting.

Mr. Prouty believes that the commission should have the power to establish through rates. (149, 150.)

Mr. KINDEL, manufacturer, of Denver, testifies that the Standard Oil Company, although it does not itself largely own wells in the Colorado fields, controls the refining business and buys practically all of the crude oil. The freight rates from the East are such that there can be practically no competition with the local product of the Standard. The Standard did cut prices for a time to 5 cents per gallon until competitors were driven out, but now, notwithstanding the nearness of the supply, oil costs 100 per cent more in Denver than in Chicago. Moreover, the freight rate on oil from Colorado to the Pacific coast is 96 cents per hundred, while that from Chicago through Colorado is 78½ cents per hundred. (259.)

Mr. SPENCER declares that the Standard Oil Company receives no special favors from the Southern Railway. It is paid mileage on its tank cars, but this arrangement is open to any shipper who furnishes a car. The private-car system is injurious to the railways, but they are unable to do away with it. (280.)

5. *Railway discriminations on export shipments.*—Mr. SNYDACKER, a grain merchant and exporter of Chicago, testified concerning the rates of transportation from Chicago to the seaboard, especially on export grain. His first statement was to the effect that the rates for all-water or part-rail and part-water transportation from Chicago were entirely a matter of trade and barter between the individual shipper and the transportation company. Mr. Snyder's firm has a man in charge of the export business who is supposed to get rates as cheap as any that are made. The witness implied that, so far as export rates are concerned, it is not illegal for the railroad company or the transportation company to carry grain at a lower rate for one person than for another. The method is the same as that regarding ocean tonnage. Mr. Snyder afterwards stated, however, that he was satisfied that his firm shipped grain on the basis of published tariff export rates, and did not solicit or obtain rates below these or below the rates given competitors. Nor does his firm receive any commissions or other indirect favors. It does not hold grain for any length of time at the seaboard, and hence could not receive advantages in storage. There appears no reconciliation of these somewhat conflicting statements. (398-400.)

B. Methods of discriminations.—1. *Generally.*—Mr. BLANCHARD says that discriminations are chiefly granted by means of secret rebates or by combinations of rates on inward and outward traffic. To a less degree they arise from special advantages in terminal facilities, in charges for switching and similar services, in storage periods, from car mileage, quicker time, allowances in weights, etc. Railways also favor certain shippers by leasing them elevators or making special elevator contracts. All discriminations are vicious and indefensible. (625.)

Mr. KNAPP is especially specific in his statements. He believes that direct payment of rebates is comparatively rare, but other methods of discrimination are endless. Thus, in certain cases railways maintain their interstate rates rigidly, but secure business by making concessions on purely State traffic. Commissions are paid to agents of shippers; shippers are favored in the purchase of supplies;

or, in many instances, the weight of shipments is underbilled. Several parties are now under indictment for misdescription of goods, by which they are brought under a class bearing a lower freight rate than that to which they really belong. (132.)

Several other witnesses, in their general statements as to the existence of rebates, already summarized, mention these various devices incidentally.

Mr. GALLAGHER refers to the straw-man system of discrimination and to discriminations by advances of money upon shipments. The straw-man system he describes in the following terms: "Instead of billing that stuff to the man I have sold it to I bill it to a fictitious man, or straw man. On the bills he is the actual shipper. I do not see him at all, don't know anything about him, but he bills the stuff to the man that I want it to go to, my customer, and it will go through all right, and by and by the straw man sends me a check for a rebate. You can not find him; at least I have not been able to do it. That was also described to me by a man who practices it." (541, 542.)

2. *Misdescription of goods.*—Mr. BLANCHARD says that many frauds are practiced upon the railways by the misdescription of goods, and that this results in discriminations between shippers. In 1898 the Westbound Inspection Bureau of the trunk lines from Boston, New York, and Philadelphia discovered 270,000 cases of misrepresentation. Thus, a box containing silks may be represented as containing shirts. The witness has recently heard a hardware manufacturer speak jocularly of putting a single piece of iron pipe in each box of brass goods shipped, and billing the whole as iron pipe at much lower rates. The railways are more and more striving to inspect such shipments, but they would be greatly strengthened in doing so by permission to pool. (675.)

Mr. KELLEY believes that the chief difficulty encountered by Philadelphia shippers in recent years has been on account of the wrong classification of hardware shipped from certain southwestern cities, Louisville and others, in competition with Philadelphia manufacturers. High-priced commodities which should bear the first-class rate were shipped as saddlery and other low-priced commodities at sixth-class rates. The witness believes that the railroad companies were not aware of this misrepresentation. (186.)

Mr. VANLANDINGHAM, commissioner of the St. Louis Traffic Bureau, believes that freight can scarcely be shipped under a false classification, or at less than its real weight, without the knowledge of railway officers. He believes, however, that there is a considerable amount of discrimination by this method. It has been felt especially in regard to hardware shipments from St. Louis. The railways, for example, have allowed large shippers to load cars with different classes of articles, which should pay separately the higher part carload rates, and have then charged at full carload rates. There is little difficulty from such abuses in territory west of the Mississippi River, since freight is inspected and weighed in practically every case by officers of an association representing the railways jointly and not any individual road. The chief difficulty which arises under this system is in deciding what constitutes the proper classification of particular commodities. (210, 211.)

3. *Underbilling of weight.*—Mr. GALLAGHER regards underbilling as one of the worst evils in the transportation business to-day. Millers have told him within a week that they have been solicited by the railroad companies to ship 200 barrels of flour and bill at 100. Where Mr. Gallagher lives peaches are shipped to Salt Lake City at four boxes to 100 pounds; he has a friend living 350 miles farther west who ships six boxes to 100 pounds, shipping to the agent of the railroad. (541, 543.)

Mr. Gallagher suggests that underbilling might in some cases be detected by authorizing a Government officer to break the seal of a car and examine its contents in cases of suspicion. (546.)

4. *Intrastate discriminations.*—Mr. GALLAGHER has heard of a practice of giving lower rates on special articles of freight within the borders of a State in consideration of the consignment of large amounts of interstate business, but he has no positive information upon this subject. (542, 543.)

Messrs. KNAPP and MORTON also refer to this practice. (132, 502.)

5. *Furnishing of cars.*—Mr. DOUSMAN says that at times railways apparently discriminate between shippers in the promptness with which they furnish cars, and he cites one recent instance in which an order for shipment was delayed an entire month. (355.)

6. *Carload and part-carload shipments.*—Mr. VANLANDINGHAM, commissioner of the St. Louis Traffic Bureau, testifies that the differences in rates on part carloads as compared with full carloads of goods are very much greater on the Western railways than on the Eastern. By an agreement made in 1896 between the

railways and the jobbers of the Pacific coast, a minimum difference of 50 cents per hundred pounds between the carload and the part-carload rate was established. This difference is greater in the case of many commodities than the possible profit upon the goods. The arrangement is intended to shut out the jobbers of Chicago, St. Paul, and other Eastern cities from selling directly to retailers on the coast. The retailers are practically put at the mercy of the local jobber. Similar extensive differences between the carload and part carload rates exist on railways leading to Texas. Discriminations between shippers are sometimes made by allowing one shipper to fill up a car with several different commodities, which should bear separate part-carload rates, and carrying them all at the lower carload rate. (207, 210.)

C. Mileage on private cars.—Members of the Interstate Commerce Commission point out that the use of cars belonging to shippers often constitutes a means of discrimination between individuals. Some shippers own thousands of these cars, and the railways pay them a rate of mileage for the use of them so high as to amount to a very large profit, even on the entire business of the shipper. Shippers take pains often to send these cars by unnecessarily long routes and not to load them to their full capacity, in order that the mileage may be as much as possible.

The so-called fast-freight lines and through-freight lines, like the Red Line, Merchants' Despatch, etc., are usually understood to have no special rates. Usually they are simply combinations among the railways themselves for through traffic. One line which operates over the New York Central as a separate company receives perhaps 10 per cent of the freight charge for its services in collecting freight. (KNAPP, 141; PROUTY, 151.)

Mr. KELLEY, of the Philadelphia Freight Bureau, also considers the private car system a means of discrimination. The mileage of three-fourths of a cent per mile allowed by the Eastern railroad companies to the owners is excessive. The railway companies get an advantage, perhaps, by making such an allowance in securing more of the business of particular large shippers. (187.)

Mr. VANLANDINGHAM, of the St. Louis Traffic Bureau, agrees in the opinion that the private-car system constitutes a method of discrimination. The allowance made by the railways west of the Mississippi River on refrigerator and similar cars is 1 cent per mile in both directions. The shorter railway lines are forced often to pay mileage on the basis of the length of the longer railways in order to secure the business of these cars. The practice of using private box cars, which prevailed up to two or three years ago, is largely ceasing, since the railways have reduced the mileage on such cars to 6 mills. The cars mostly used are stock cars, which are largely owned by companies controlled by the officers of the railways themselves, and refrigerator cars, which are owned by large meat packers and beer shippers, either directly or by means of subsidiary companies, organized partly for the purpose of evading the law. (209, 210.)

Mr. GREELEY, a commission merchant of Chicago, says that firms in which P. D. Armour is interested own between 10,000 and 20,000 private cars. The mileage on cars generally amounts, he thinks, to 25 or 50 per cent per year on the value of the car. Private cars are by no means confined to handling products which are perishable. The witness believes that even where railroads could use cars of their own, private-car shippers are so powerful as to compel them to use private cars and pay mileage. The owners of these cars make so much money from them that competition against them is impossible. (373, 378.)

Mr. DOUSMAN, a Chicago grain shipper, refers to an instance in which a certain grain shipper having asked for one 1,000-bushel car was furnished with two smaller cars belonging to a private-car company. The object of this was to enable the railroad to pay a large amount in mileage to this company, which seems to have practically forced the railroad to help it to maintain its large profits on that feature of its business. The railroads would like to abolish the private-car system, but can not do it so long as any one road permits these cars to be used. The system is simply an indirect method of cutting rates. (362.)

Mr. BACON, of the Milwaukee Board of Trade, thinks that private cars are a convenient means of making discriminations, but he is not aware that they are used in the grain business. (430.)

Mr. CALLAWAY, president of the New York Central, likewise thinks that great abuses arise from the private-car system, especially in the case of dressed beef refrigerator cars. The most of the railroads, he thinks, pay a mileage of 1 cent per mile, although the New York Central has refused to pay more than three-fourths of a cent, since its income from the freight would have been practically nothing at the other figure. The railways themselves are all anxious to break up the practice, but no railroad dares to build and operate the cars, since all of its

traffic in dressed beef would immediately be turned away to other railroads. If the railways were allowed to pool and divide their traffic they could agree in refusing to haul such private cars, and would then be able to furnish cars themselves. The railways pay to one another six mills mileage for the use of cars, and they calculate that this is a fair payment for interest and repairs. In view of the enormous distances which are covered by the dressed-beef cars the profits from their mileage are very high. The cars are carried back practically empty, but this would still be the case if the railways owned refrigerator cars. It would be much cheaper, however, for the railways to operate their own cars. Most of the beef shipped for Eastern consumption is already dressed. The witness does not think that individual discriminations are made in the shipment of dressed beef. The rates are open to all shippers. But it requires large capital to establish a refrigerator-car system, and practically only three or four establishments control the business.

The railways do not especially object to the use of private cars for iron, steel, oil, and similar shipments, where the rate of mileage is usually only 6 mills. (230-232.)

MR. INGALLS, of the Chesapeake and Ohio, also believes that the use of private cars benefits large shippers at the expense of small shippers. He thinks that the owners may get 15 or 20 per cent on the investment in these cars. Up to five years ago the trunk lines largely refused to run private cars, but the restrictions have gradually been dropped, and although the railways would like to refuse to haul them and to substitute their own cars, they are unable to do so, since they can not make pooling agreements. (301, 302.)

MR. KENNARD, a commission merchant, of Chicago, declares that there is discrimination in favor of a few large fruit shippers in shipments from California to the East. These concerns apparently own the refrigerator cars for the most part. They can, accordingly, get cars in any number for their own use at the time wanted, while private growers or small shippers must pay to them a considerable premium to get cars—\$60 to \$90. This arrangement often practically shuts out the smaller shipper. (363, 364.)

Mr. Kennard declares that owners of private cars often load them in part with commodities bearing a high class of freight, but have them billed at rates applicable only to the lower class, of which part of the load consists. (365.)

MR. MALLORY states that no cattle shippers engaged exclusively in the live-cattle business, so far as he knows, own cars. Very few concerns devoted exclusively to shipping live stock would handle business enough to warrant their keeping a line of cars. The great packing houses, such as Armour & Co. and Swift & Co., do have cattle cars of their own, though they also ship cattle in the railroad cars. These concerns have an advantage to the extent of whatever profit their cars bring them, and it would seem to be more proper that the railroad company should conduct its business with its own cars. (589.)

MR. BURD, of the Chicago, Milwaukee and St. Paul Railway, says that until recently the railroads had not enough cars to meet emergencies in busy seasons, and were glad to use cars belonging to private owners. Many classes of manufacturers wish cars having a special capacity or character. Finally the development of the packing business made the use of refrigerator cars necessary on a large scale. While the railways would be glad to furnish all the cars for ordinary business, and in fact do so for the most part, the witness doubts whether it would be to their advantage to attempt to furnish refrigerator cars. The number of cars actually used under private ownership is much less than would be necessary if every company solicited the business and had a sufficient number to carry all that it could possibly get at any time. The packers bear their own risks as regards the preservation of the meat shipped, in the absence of special delay on the part of the railroad. It requires technical knowledge to be sure that the car is in proper condition for shipping meat, and the railways would not like to be responsible. The payment of mileage to the owners of private cars is not an injustice to other shippers. The owner has his money invested and is entitled to something for the use of cars, just as any other manufacturer having superior facilities is entitled to the benefit of his investment. Railroads ordinarily pay one another six mills per mile for the use of common cars costing perhaps \$400 or \$425. Refrigerator cars cost \$900 to \$1,000, and the mileage of one cent is therefore not to be considered excessive. (475, 476.)

MR. FISH, of the Illinois Central, while recognizing the abuses of the private-car system, thinks that they are less serious than formerly, and that, as the cost of constructing and repairing cars is tending to increase on account of the larger size and the greater complexity, the time will come when the undue profit of the owners from mileage will be reduced to a reasonable amount. The railways are

becoming better able to buy their own equipment, and can resist demands for higher mileage rates. (336.)

D. Effects of discrimination on combinations, etc.—Mr. KNAPP, chairman of the Interstate Commerce Commission, believes that railway discriminations of all kinds tend, generally speaking, to benefit great shippers and manufacturers, men of wealth, at the expense of the masses of the people. Farmers and small producers get no favors. He believes that trusts and monopolies would not be dangerous to the social welfare if they had no advantage from the railways. Almost the only unfair advantage which can come between the producer and the consumer of staple commodities comes through transportation. Under ordinary circumstances anyone can buy wheat or corn, can build a mill and grind it, or establish a store and sell it; but the opportunities for the transportation of wheat and corn are limited, and through them discriminations may be made. A few years ago anyone could buy grain west of Chicago, and there were many buyers; but at present, through the action of railways, one buyer takes all the grain on one line of railroad, and there is practically no competition. (147, 148.)

Mr. BLANCHARD, of the former Joint Traffic Association, admits that discriminations are chiefly in favor of large shippers and that they tend to destroy small producers and dealers. He does not say directly that discriminations have fostered trusts or that the railways are the parents of trusts, but he admits that if present tendencies continue trusts will undoubtedly be placed at an advantage. The witness denies that the railroads have any desire to favor large shippers or trusts. They know that to strengthen shippers will enable them to make yet greater demands from the railways. In every city the aggregate of freight from small shippers is greater than that from the principal large shippers. There is no railroad company which would not desire to see fewer favors granted to trusts and combinations. (683, 684.)

Mr. RIPLEY, president of the Atchison, Topeka and Santa Fe Railroad Company, says that the railroads want equal rates, but the large shippers do not. All the large shippers, however they may theorize about the desirability of equal rates, believe in their hearts, and act upon the belief, that their large business entitles them to concessions. Believing this, they are actively engaged in finding ways to evade the law. Comparatively few of the railroads are strong enough to resist the pressure which such men can bring to bear. There are so many ways in which concessions may be made without violating the letter of the law that it is impossible to prevent discriminations by statute. It is very difficult to obtain evidence of evasions of the law, made by indirect methods. Discriminations will continue until it becomes the interest of the carriers, as it is not now, to maintain equal rates. Discrimination between individuals has been much more rife since the attempt was made to prevent it by law than it ever was before. (594, 596.)

Mr. REAGAN, of the Texas railway commission, declares that railway discriminations not only injure shippers, increasing the cost to the smaller and poorer shippers for the benefit of the few, but that they generally injure the revenues of the railroads. They should be prohibited under penalties which would make them a felony. (342.)

Mr. COWEN does not think that the railway discriminations are more generally in favor of so-called trusts than of other large shippers. This is certainly true about the great combinations in the steel industry. The rates to all iron and steel producers have been unjustly low during 1899 in view of the high prices of those products. (317.)

E. Remedies for discriminations.—Most representatives of the railways think pooling the only effective remedy for discriminations. See pp. 97, 98.

Mr. DICKINSON says that it is not so much a question what the absolute rates are which he pays, provided they are equitable as compared with those which his competitors pay. He himself pays the full tariff rates. He has no personal knowledge of rebates, but no intelligent man can say that he does not hear a good deal in regard to them. He believes that rates ought to be alike to all, and that the railroad companies should not favor any industry or any individual as against another, or monopolize any industry through its control of transportation. The witness formerly felt that the best service ought to come from unrestricted competition; but he is convinced that the only remedy for the troubles that exist is Congressional control of the railroads, and he has reached the conclusion that the railroads themselves, as well as the public, would be benefited by a control outside of themselves. (551, 552.)

Mr. TUCKER, chairman of the Central Freight Association, does not consider it right that the men best able to pay the tariff rate should get rebates and special favors. He would approve of a system of regulation to stop all rebates and discriminations, and he believes that the reliable roads would approve of it. (561.)

1. *Publicity*.—Mr. Spencer believes that complete publicity of railway affairs and accounts is the most effective remedy for discriminations, although the prevention of illegal actions is, in any case, difficult. (273, 279.)

See also pp. 117, 118.

2. *Enforcement of existing laws*.—Mr. KNAPP, chairman of the Interstate Commerce Commission, sees no effective way to enforce the provisions of the laws against railway discriminations, except by making violations criminal misdemeanors. No suit for damages is sufficient. The corporations themselves, rather than some agent who is not the real offender, should be indictable. At the same time the law should be made somewhat specific as to what is required, and the penalties should be also more accurately prescribed. Thus the present requirement as to publishing rates is very vague and should be made more specific. (137.)

Mr. CLEMENTS, a member of the commission, sees no reason why courts should not be empowered to enjoin officers or agents of railways from continuing any practice in violation of law. He believes, also, that the seizure of goods in transit, where they are carried in violation of the law, would be desirable. (160.)

Mr. NEWCOMB, of the division of statistics, Department of Agriculture, says that the burden of excessive or discriminating rates is shifted in varying degrees upon consumers and others, so that it is impossible for the courts justly to determine the amount of damages to aggrieved parties. (99.)

Mr. FISKE does not think that the inspection of railway books by Government officers would result in the discovery of many abuses or in securing evidence for prosecution. He believes that sufficient remedies exist under the present law if it is vigorously enforced and if the offenders are actually punished by fines and imprisonment. The difficulty at present is largely in the failure of the persons injured to make complaint. (338.)

Mr. CARTER knows no better method of preventing discriminations than to enlarge the powers of the Interstate Commerce Commission and to enforce the law. (584.)

3. *Shall punishment be by fine or imprisonment?*—Mr. RIPLEY, of the Atchison, Topeka and Santa Fe, thinks that fines upon the corporation offending would check discriminations much more effectively than the threat of imprisonment. Railroad managers meet their competitors from time to time, and very few men would be willing to inform the authorities of anything that would criminate their acquaintances. The existing law is an absolute failure. There has never been a conviction under it, or if there has been a conviction it has been nominal. (595.)

Mr. MORTON also disapproves of the imprisonment clause, thinking that it prevents effective enforcement. He favors a very heavy fine, both on the shipper receiving the cut rate and on the railroad. Shippers practically always know when they are receiving cut rates, and are as much at fault as the railroads. (495.)

Mr. INGALLS, of the Chesapeake and Ohio, agrees in thinking that the imprisonment feature of the interstate-commerce law prevents it from being effective. People do not consider the making of different prices to different individuals a crime in ordinary business, and public opinion is not prepared to enforce the penalty of imprisonment upon railway officers for making discriminations. The violation of the law should be made punishable by fines, and the witness thinks it possible by putting a fine upon every bill of lading to make this an effective punishment. (286, 297.)

Mr. HYLAND, of the Chicago Board of Trade, thinks that violation of the interstate-commerce law should be punished by fines against the railway companies rather than penalties upon individuals. Each carload or part carload shipped in violation of law should constitute a separate offense; the penalty should be double the gross earnings for the service performed, and should be divided equally between the informant and the Government. Some one official of each railroad should be held accountable for the strict maintenance of rates. (351, 352.)

Mr. VANLANDINGHAM, of the St. Louis Traffic Bureau, takes practically the same position as Mr. Hyland. (214.)

Mr. CARTER thinks it likely that evidence of discriminations could be got more easily if the penalty were a fine than it can be while the penalty is imprisonment. (585.)

Mr. DOUSMAN, a grain shipper of Chicago, believes that a fine is a more effective penalty than imprisonment, especially because railway officers will not testify against one another so long as the imprisonment penalty exists. (361.)

Mr. BIRD, general traffic manager of the Chicago, Milwaukee and St. Paul Railway, declares that the penalties against discriminations are so severe as practically to make it impossible to learn the truth. They encourage great ingenuity

in covering up discriminations. The way to prevent discriminations is to remove the possibility of gain by placing heavy fines upon the railroad companies themselves, which would then see to it that their employees complied with the law. It would require great provocation or influence to induce a railroad officer to testify against another railroad officer if it might result in sending him to jail, while he would feel no such reluctance if the penalty were a fine. (471.)

Mr. SPENCER, president of the Southern Railway, on the other hand, believes that the penalty of imprisonment for violations of the interstate commerce act should be retained. Fines of the amount of \$5,000 could be paid repeatedly by many railways out of the profits of illegal business. It is not a hardship to imprison subordinates for knowingly violating the law under direction of their superiors, and, furthermore, the persons really responsible can usually be ascertained if sufficient effort is made. (274.)

Mr. REAGAN believes that the penalty of imprisonment as for felony should be imposed in cases of violation of the interstate-commerce act, and believes that it would be possible to enforce such a penalty, although he knows of no instances where it has yet been done under the Texas railway commission statute. (342, 350.)

IV. DISCRIMINATIONS BETWEEN PLACES—LONG AND SHORT HAUL.

A. Existence and causes of place discriminations generally.—The members of the Interstate Commerce Commission who testified before the Industrial Commission agree in believing that inequalities in rates between different places, including especially discriminations in favor of terminal points having a longer haul, but also other differences, are exceedingly numerous, and constitute perhaps the most injurious feature of railway discriminations. Place discriminations are made, not by departure from published tariffs, but by unfair tariffs themselves.

Differences in rates over the same road, according to the direction of shipment, are also common, and are claimed to be justifiable often to prevent cars from being returned empty. (See also *Southern States*, p. 63)

All of the Interstate Commerce Commissioners called attention to the fact that these place discriminations, like long and short haul discriminations, are often defended by railroads as being necessary to meet water competition.

Mr. KNAPP and Mr. CLEMENTS pointed out what great effects upon the prosperity of individuals, towns, and sections of the country would result from apparently slight differences in railway rates. Thus a difference of \$2 in the terminal charges on each car of live stock at Chicago, which a certain court considered insignificant, amounts to half a million dollars during the year. A difference of 2 or 3 cents in the freight rate on wheat from a certain section in Iowa was estimated to represent a difference of \$5 per acre in the value of land. The margin on which many lines of business are done is so slight that small differences may completely change the location of a manufacture or the profits of a business. An increase in the average rate of freight per ton per mile of $1\frac{1}{2}$ mills would represent an added revenue of about \$100,000,000 to the railroads and corresponding outlay by the public. Mr. Knapp calls attention to the inequality in the conditions of competition between different producers brought about by such differences in rates, whether these differences be over the same railroads or over different ones, and whether the favored shipper be a small producer or a combination. The margin of profit in most lines of business is so small that a slight adjustment of rates will exclude one shipper from a particular consuming territory, while benefiting another shipper. (KNAPP, 133-135, 142; PROUTY, 148, 149; CLEMENTS, 154, 157.)

Mr. BIRD, of the Chicago, Milwaukee and St. Paul Railway, declares that fully 75 per cent of the rate disturbances in the West and Northwest originate primarily in the question as to what is a fair relation of rates between competing markets. There is nothing in the interstate-commerce act by which such a fair relation can be determined. Thus, one road may make the rate on some heavy class of goods, such as iron, but little more from St. Louis to St. Paul than the rates on another road from Chicago to St. Paul or from Milwaukee to St. Paul, although the difference in distance is very considerable. It will be impossible to remedy these injustices unless the Interstate Commerce Commission is given power to prescribe minimum rates as well as maximum rates. If it orders that one railroad shall not make more than a certain difference between different places, there is nothing at present to keep another railroad from reducing its rates in the same proportion. There is no doubt that towns are created or destroyed by the mere matter of the relation of railway rates. (472.)

Mr. DICKINSON, manufacturer, La Crosse, Wis., states that a railroad general manager said to him that the rates are made on a basis which is not calculated to

favor the Western manufacturers in shipping East. It has been the practice of certain railroads to try to build up certain trade centers. Some people are very much dissatisfied with this, but others, perhaps, feel as well satisfied to have a center built up where they can get their materials on short notice without a great difference in freight. On general principles it would seem that business should be built up where there are natural advantages for it. Any discrimination on the part of the railroad diverts the development from a place where it is natural to one where it is unnatural. The witness considers, however, that the question must now be considered in the light of existing conditions. The business of the West to-day, especially the manufacturing business, has been largely built up by what may be called favors in the way of commodity rates, particularly where the roads may have united upon some one town against another where the natural advantages are greater. Whatever the injustice of this course may have been in the first place, the proposition to change it must now be considered in the light of the fact that large and prosperous communities so built up are in actual existence. Towns which have continuously received such privileges may be considered to have acquired a certain vested right in them, and the witness does not consider that there has been any such continuous protest on the part of other communities as might have interfered with the valid establishment of such a vested right. He mentions particularly the iron and steel manufacture, which is not natural to the West, as an instance of businesses built up by such discriminations. (550, 551.)

Mr. TUCKER says that the rates from all points on the east bank of the Mississippi River to the Eastern seaboard are the same, and that the Western roads haul at the same rate to all points on the east bank of the Mississippi. By this means equal through rates through all gateways are obtained. (562.)

Mr. RIPLEY, president of the Atchison, Topeka and Santa Fe Railroad Company, says that the adjustment of rates between different localities can never be made satisfactory to everybody. Every road is interested in a particular locality, and the result must always be a compromise, which generally is not satisfactory to anybody, and is very unsatisfactory to a great many. The endeavor has been to do the fair thing. There have been so many opposing interests that it has been impossible to do anything very unfair, although it is not an exact science. There have been many cases in which Mr. Ripley would have been glad to place the entire responsibility on an outside body, such as the Interstate Commerce Commission, and have them say what should be done. (597, 598.)

Mr. BLANCHARD declares that the practice of granting discriminating rates to individuals often results in considerable discriminations between places. Shippers at one place who believe that their rivals are getting special discriminating rates are apt to combine and obtain special rates for their own market. Thus sometimes departures from tariffs become the rule as to certain shipping points. Individual discriminations are granted more in favor of shippers at central points than at local stations. Aside from discriminations of this class, there are differential rates and apparent discriminations between localities which are often justifiable. Each railway is inclined to build up its own important towns by specially favorable rates. Many influences combine to complicate the problem of a fair adjustment of rates between different places. (626, 627.)

Mr. DOUSMAN, a grain shipper of Chicago, believes that in the same general section of the country railroad freight rates should be made strictly uniform, so much per ton per mile, regardless of the character of the roads. The railroad that carries goods cheapest in this country is the Chesapeake and Ohio, which runs over mountains and through tunnels. "Differentials are inventions of the devil." Practically 75 per cent of the business of every railroad is its own natural business, which it can do better than any other. If the remaining 25 per cent of competitive business be allowed to distribute itself naturally, on the basis of open and stable rates, the railroads and the general community will be benefited. (361.)

Percentage rates.—Mr. TUCKER, chairman of the Central Freight Association, states that the system of fixing rates to the seaboard from large portions of the country upon the basis of certain percentages of the Chicago rates was established some 15 or 20 years ago, through what was called the joint rate committee. The east bank of the Mississippi pays 116 per cent of the Chicago rate, and the percentage system extends as far east as Buffalo. Buffalo pays, he thinks, two-thirds of the Chicago rate. The 100 per cent territory runs up into Michigan, and the percentage gradually decreases as one advances toward the East. The decrease is not exactly proportional to the distance. The rate per ton per mile is somewhat higher for the shorter distance. This is proper, because the terminal expense is the same for a haul of 50 miles as for a haul of 500. There have been some changes in the percentage basis for certain towns since the arrangement

was first made, but the changes have been few, and there has been little complaint. If the shippers of any town thought their rate too high, they would make their complaint to the general freight agent of their road. If any road felt that its town was injured by an unjustly high rate, it would, no doubt, get such an injustice corrected. As a rule the Eastern connections take it for granted that the men where the traffic originates know most about the situation, and carry out what they suggest. So the question of maintaining or reducing rates rests chiefly with the road that first receives the freight. (561-563.)

Mr. MUSSELMAN, president of the Grand Rapids Board of Trade, states that the rate from Grand Rapids to the seaboard is 96 per cent of the Chicago rate, and that he believes that Grand Rapids is justly entitled, on the actual mileage basis, to a 90 per cent rate. Grand Rapids was on a 100 per cent basis up to 1891. At that time the Grand Rapids Board of Trade undertook to get the rate changed to the 90 per cent basis, and succeeded in getting a reduction to 96 per cent. Mr. Musselman believes that the present basis still amounts to a discrimination against his town. (556.)

B. Long and short haul discriminations generally.—Mr. BLANCHARD states the principle of the long and short haul clause in the interstate-commerce act as follows: An interstate rate or fare made between any two points shall not be exceeded by the rate on the same article moved over the same line in the same direction under similar circumstances and conditions. He regards the requirement as just in the majority of cases, but declares there are some justifiable exceptions, especially on account of water competition or the competition of Canadian railroads. He mentions a number of specific instances justifying lower rates to through points.

Mr. NEWCOMB, of the division of statistics, Department of Agriculture, says that under this provision of the interstate-commerce act the courts have interpreted "dissimilar conditions" to include conditions of competition and other conditions which make the provision practically ineffective. The witness does not consider a change of the law sufficiently important to be pressed if it is likely to arouse opposition to other needed legislation. (104.)

Mr. BACON, of the Milwaukee Board of Trade, thinks that the provision in the long and short haul clause as to the dissimilarity of circumstances and conditions should be stricken out, leaving it, however, to the Interstate Commerce Commission to suspend the operation of the clause where judged expedient, as in the case of water transportation. The decision of the Supreme Court that railroad competition justifies lower rates for longer hauls seems to the witness unwarranted. (420.)

MESSErs. KNAPP, PROUTY, and CLEMENTS, of the Interstate Commerce Commission, are unanimous in saying that the discriminations between long and short hauls made by railways are exceedingly numerous, and are probably the most serious abuse now existing. The evil is most conspicuous in the Southeastern States and in the far Western States. These States are peculiarly situated with reference to water transportation, and the railways defend the lower rates to terminal points on this account. Mr. Clements, however, points out that no such great inequalities in rates exist in the vicinity of the Great Lakes of the North. The Supreme Court holds that a dissimilarity in conditions sufficient to justify departure from the rule of the law is made by competition, whether by water or among railways themselves. Mr. Clements points out that the railways never did, before the interstate-commerce act, charge less for longer hauls than for shorter ones, except on account of competition, and he would favor inserting a clause in the law by which competition should not be allowed to count as constituting dissimilar circumstances. Ownership of property in particular towns by railway officers is pointed out as another influence leading to discriminations.

Mr. Knapp and Mr. Clements agree that the method of adjusting rates as between competitive and noncompetitive points on the same road is usually that the rates to the noncompetitive points increase with the distance until the rate equals the through rate to the terminal point plus the local rate back from the terminal point to the point of destination. It would thus be as cheap to send the goods through and back again as to stop them off; but of course, as a matter of fact, they do not go through. Mr. Clements especially declares that since rates include terminal charges, the dealer in the small town has to pay practically four terminal charges, besides the charge for transportation pure and simple for a distance greater than that to the terminal point, whereas the dealer at the terminal point has to pay only two terminal charges. It is as cheap to ship goods, for example, to a point 50 miles beyond Atlanta as to a point 50 miles this side. The effect of the prevalence of this practice in the South is seen in the marked difference between the prosperity of the few trade centers and that of the small intermediate towns, whereas the small towns of the North often show a high degree

of prosperity. It is impossible to establish manufacturing enterprises in small towns in the face of such discriminations. (Knapp, 134, 137; Clements, 154, 155.)

Mr. VANLANDINGHAM, freight commissioner of the St. Louis Traffic Bureau, also comments on the disregard of the long and short haul rule in the Southeastern States on account of water competition. He is not sure that the effect is altogether injurious to local stations. The jobbing houses at the central points may be able to sell goods at lower rates to the local stations, through having a lower freight rate, than would probably be secured if all the rates were made uniform.

Mr. Vanlandingham further points out that the interpretation of the courts regarding the long and short haul clause puts the water carriers at a disadvantage in competition. The railways can make their rates to the few points reached by the water carrier so low as to drive it out of business, while holding up their rates to intermediate territory. (202, 206.)

Mr. SPENCER, president of the Southern Railway, thinks that if the rates for shorter hauls are themselves reasonable in view of the amount of traffic and the cost of service, there should be no objection to the railways making whatever rates are necessary to meet competition or to develop traffic to through points. Otherwise it might not get the long-distance traffic at all. In sparsely settled regions the amount of business is less, and the cost of construction and operation is always relatively greater, and often absolutely greater. It would be impossible to satisfy all communities in any case, since no two persons or communities will consider in the same light the unlike conditions which exist in different cases. Large cities, by the very nature of things, have certain advantages in business over small places, and this advantage must extend to railway transportation. (275, 281, 284.)

Mr. TUCKER, chairman of the Central Freight Association, considers that there are strong arguments against the long and short haul clause. The competition of the Galveston route to Liverpool from Kansas City, for instance, forces the making of very low rates from Kansas City eastward. The long and short haul clause compels the making of the same rates from intermediate points, where there is not the same competition, the same necessity. (560.)

Mr. CALLAWAY, president of the New York Central, says that it is the policy of the Vanderbilt lines to make local rates substantially proportional to through rates, under the belief that local business and local prosperity can not be built up at rates so high that competitive business could be done much cheaper. (232.)

C. Specific cases of place discriminations, water competition, etc.—1. Differentials as to Eastern ports.—Mr. KELLEY, freight commissioner for the Trades League of Philadelphia, testifies that that city is peculiarly situated between New York and Baltimore, and has only 4 trunk lines from the West. Its coastwise trade is practically limited to a single line of steamers running to Norfolk. The city is allowed a differential of 2 cents as compared with New York on grain freight rates from Western points, while Baltimore has a differential of 3 cents; i. e., the rates are respectively so much lower than those to New York. (185, 186.)

Mr. NEALL, a shipping merchant of Philadelphia, also speaks of the existing differentials. He considers that Philadelphia is unfairly discriminated against still, especially because of the larger differentials allowed to the more southern ports. (173.)

Mr. CALLAWAY, of the New York Central, testifies that the existing practice of allowing differentials on shipments from the West to Philadelphia, Baltimore, and other more southern ports as compared with New York was established about 20 years ago, when the average freight rates were very much higher than at present, ranging from 52 to 60 cents. At present the rates on grain, for example, have been reduced to 15 or 18 cents, and the differential is thus proportionately greater, and, in the opinion of the witness, excessive. At present, by an arrangement with the Baltimore and Ohio and Chesapeake and Ohio, the experiment of making the differential only 1 or 1½ cents on export grain is being tried, but on other commodities the 3-cent differential is retained. Improvements in the ports of Baltimore and other Southern cities have also lessened the justifiability of such a differential. The terminal changes are, so Mr. Callaway thinks, adjusted in practically the same way at each of these ports. The New York Central has an extensive system of lighters, and its freight rate includes the charge for carrying the grain to the side of the ship in the lighter, but not for transferring it to the ship. As a matter of fact, most grain coming from Chicago goes by way of the Great Lakes, so long as they are open, and the New York Central. The Southern ports are less used for Chicago shipments, but St. Louis shipments go to them, as well as to the Gulf ports. Mr. Callaway is not prepared to say that a complete removal of the differential, so as to make the rates from the Western points to Eastern ports uniform, would be acceptable or

even tolerable for the Chesapeake and Ohio and Baltimore and Ohio railroads; but he is convinced that the present differential is too high. Permission to the railways to pool their business would undoubtedly do away with this complication. (224-226, 235.)

Mr. BLANCHARD refers to the establishment of the present differential rates as between the leading Eastern seaboard points. The system was first adopted in 1877, after the railways had squandered millions of dollars in rate wars. Irregularities in steamship sailings and rates, with many other complicating elements, made the adjustment of rail rates on goods intended for export at the different ports exceedingly difficult. Often the railroads had made through rates from inland points to foreign ports, and had afterwards found the entire inland charge absorbed by the increased ocean rates. After a long discussion an agreement was reached fixing differences in charges over the lines reaching the various ports. (673.)

Mr. SNYDACKER, a grain merchant of Chicago, also refers to the differential in favor of Baltimore and other Southern ports and to the relative decrease of the export business through New York. He says that the terminal charges for grain at New York may also be higher than at other ports. (397.)

2. *Southern States*.—Mr. KNAPP, of the Interstate Commerce Commission, thinks injustice is done by the Southern railways in charging more for shipments going north than on those going south. (135.)

Mr. SPENCER, president of the Southern Railway, declares that the reason why higher rates are frequently charged for hauling products from the South to the North than vice versa is not because the dominating load goes north, and the cars would often be empty if lower rates were not made from the North. The direction of the dominating load varies at different seasons of the year. The classes of freight on which the rate from the South to the North is high are largely fruit and vegetables, which are exceedingly perishable, which require a special class of equipment and especially high speed of transportation, and with which a large amount of ice must usually be hauled free. (275.)

Mr. VANLANDINGHAM testifies that rates from the Northeastern States to the Southeast have been lower than from Chicago, St. Louis, and Cincinnati, thus injuring the general merchants and manufacturers of these more western cities. The Interstate Commerce Commission has four times ruled against this discrimination, but its order has never been obeyed. (202.)

3. *Shipments by way of Gulf of Mexico and their effect on other routes*.—Mr. VANLANDINGHAM, of the St. Louis Traffic Bureau, testifies that there has been a very large increase in ocean transportation from Galveston and other Gulf ports, and consequently in railway transportation from the middle West to the Gulf. Every freight rate from west of the Mississippi River as far north as the Platte River is affected by Gulf competition, which practically determines the freight rates to the Atlantic seaboard. The Illinois Central also carries a considerable traffic to the Gulf. The ocean freight rate is about 4½ cents per hundred higher from Gulf ports than from Atlantic ports. The difference between export rates and domestic rates on the railways leading to the Gulf is even higher than on those leading to the eastern seaboard.

Mississippi River transportation also has a considerable influence. This influence varies according to the condition of the river, but often practically determines the rail rate on grain from St. Louis to Baltimore. The river traffic has, however, fallen off somewhat as compared with several years ago, and may be still further injured by the excessive competition of railways. (197, 206.)

Mr. KNAPP, of the Interstate Commerce Commission, says that the freight rates from New York to Chicago, St. Louis, and Kansas City have for years been adjusted with reference to one another. The first-class railway rate to Kansas City has been \$1.47. Recently the Kansas City, Pittsburg and Gulf, being in the hands of receivers, in connection with the Mallory Steamship Line, made a rate of 80 cents from New York by way of Galveston. This has since been abandoned by order of the court in charge. (133; see also Mr. KENNARD, p. 364.)

Mr. VANLANDINGHAM also refers to the recent adjustment of rates from Eastern points, extending as far west as Buffalo, by way of ocean carriers to Galveston and thence to Missouri River and other Western points, by which shipments could be made as cheaply as from Chicago or St. Louis to the same place. This abuse has been remedied at present. (202.)

Mr. KENNARD, of the Chicago Butter and Egg Board, also refers to the fact that in April, 1898, the railroads entering Kansas City and other Kansas points charged the same rates from those points to the seaboard as was charged from Chicago to the seaboard. The cut was first made by a railroad not entering Chicago, but those which do reach that city were then compelled to meet the cut. The object

of this arrangement is largely to develop the business of the through fast-freight lines on the Eastern roads. The witness thinks that Gulf competition has little to do with the practice, which is decidedly injurious to the interests of Chicago. (365.)

Mr. CALLAWAY, president of the New York Central, likewise refers to the increased competition of the Gulf ports with the Atlantic ports in export trade, and declares that practically all the rail rates have been reduced by this competition. It is no longer possible to increase the rates on grain over the railways when navigation on the Great Lakes closes. The competition of the St. Lawrence for grain shipments also keeps down rail rates. The freight rates are also affected by the ocean rates, since the railways must enable American products to be exported in competition with foreign products. (225.)

Mr. FISH, president of the Illinois Central Railroad Company, on the other hand, thinks that the Gulf ports do not get a natural proportion of traffic. He points out the immense importance of the territory tributary to the Mississippi River. It contains 41 per cent of the area of the United States and nearly half its population. Because of the constant reduction in freight rates the matter of railway grades is increasingly important in determining the direction of railway traffic. The level prairies of the Mississippi are specially favorable. New Orleans is the natural outlet of this great valley. The air-line distance from Chicago to New York is 709 miles, and to New Orleans 826 miles; but owing to the mountainous character of the Eastern States, the shortest railroad from Chicago to New York, 912 miles, is of the same length as the shortest to New Orleans. On this shortest line to New York, moreover, there is a dead lift in altitude of 1,571 feet, while the lift to New Orleans is only 214 feet.

The following table shows the short-line distance by rail from the leading interior grain markets to New York and New Orleans, respectively:

| | To New York. | To New Orleans. | Saving to New Orleans. |
|-------------------------|-----------------|--------------------|------------------------------|
| | <i>Miles.</i> | <i>Miles.</i> | <i>Miles.</i> |
| Chicago, Ill. | 912 | 912 | 0 |
| Duluth, Minn. | 1,300 | 1,337 | 53 |
| Minneapolis, Minn. | 1,332 | 1,270 | 53 |
| St. Paul, Minn. | 1,321 | 1,268 | 53 |
| Sioux City, Iowa. | 1,422 | 1,258 | 164 |
| Omaha, Neb. | 1,402 | 1,070 | 332 |
| Dubuque, Iowa. | 1,070 | 988 | 91 |
| St. Louis, Mo. | 1,058 | 695 | 363 |
| Peoria, Ill. | 1,006 | 860 | 146 |
| Cairo, Ill. | 1,089 | 554 | 535 |
| Evansville, Ind. | 989 | 708 | 281 |
| Louisville, Ky. | 867 | 716 | 121 |
| Nashville, Tenn. | 930 | 557 | 382 |
| Denver, Colo. | 1,432 | 1,356 | 576 |
| Kansas City, Mo. | 1,335 | 878 | 457 |

New Orleans has six great railroad systems, reaching a very wide extent of territory, with a total mileage of 19,086 miles. Although the railroads of the South immediately after the war were largely physical and financial wrecks, they have gradually improved, until now in safety, speed, and regularity of service they equal, if they do not excel, the Eastern railroads.

In view of these facts a much larger proportion of traffic, especially for export purposes, ought to be carried by way of New Orleans than is now carried. The railways do not discriminate in favor of that point, but, if anything, against it. Only 16.4 per cent of the freight carried by the Illinois Central Railroad in 1898 was through freight. The gross receipts of all the railroads entering New Orleans during 1898 were 30 per cent more than the value of all imports and exports at New Orleans. (321-324.)

It is not true, Mr. Fish continues, that the exportation rates on grain and other products from Chicago by way of New Orleans regulate the rates by way of New York, but vice versa. The witness does not think that the difference in the distance from New Orleans to Liverpool accounts for the small proportion of business at New Orleans. The distance is perhaps 50 per cent greater and the average time of the ocean voyage is relatively still longer by way of New Orleans as compared with New York. But the vessels from New Orleans avoid the most northern course, and the duration of the voyage is relatively less important in the case of products exported, where there is little haste for delivery. The imports by way of New Orleans are especially light. That city was formerly the market for

nearly everything brought into the Mississippi Valley, and it is still the natural gate for the entrance of coffee and many other products. Although the import traffic is so small, the north-bound freight on the Illinois Central is usually about equal to that south bound, so there is no special expense from hauling empty cars.

The barge transportation on the Mississippi River is a much less important factor than formerly, since the rail rates have been made practically as low as the water rates.

There is constant competition between business by way of New Orleans and Cairo and by way of Kansas City and Galveston. (329, 330.)

4. *Discrimination against Chicago.*—Mr. KENNARD also points out that the freight rate on cheese and similar articles from Wisconsin to Chicago is higher than that from Michigan and New York to Chicago for similar distances. The railroads assign as the justification for the lower freight rates going west the fact that cars largely go back empty. (365.)

Mr. MALLORY considers that the terminal charge of \$2 per car on cattle brought into Chicago (see p. 48) amounts to a discrimination against Chicago in favor of Kansas City and other markets. It has diverted a good deal of business from Chicago. The feeling of injustice which it gives rise to is more effective in driving away business than the money demand in itself. Competing markets use it as an argument against shipping to Chicago. (588.)

See also paragraph 3, above.

5. *Discriminations against St. Louis.*—Mr. VANLANDINGHAM, commissioner of the St. Louis Traffic Bureau, testifies that that organization consists of about 2,200 merchants and manufacturers, and that it was organized largely for the purpose of removing railway discriminations against St. Louis as compared with Chicago and other cities. It is believed that in various ways St. Louis is put at a disadvantage in securing trade, although some of these inequalities have been recently removed. Mr. Vanlandingham does not think that railways usually make place discriminations with a view to injuring or benefiting any city, but simply with a view to their own earnings. They frequently do not know or think of results.

One method by which Chicago has been favored is by export freight rates. Thus the rate from Kansas City to Chicago on grain intended for export has been 3.2 cents lower than on grain for local consumption, a distinction which was not made in regard to shipments through St. Louis. As a matter of fact, practically all the grain has been shipped to Chicago on these export rates, even when intended for domestic use, thus giving that city a general advantage. Moreover the practice of allowing to certain large firms owning elevators a sum ranging from one half to 1½ cents per bushel has been established on practically all of the railway lines leading into Chicago, but not on those leading to St. Louis. This and other advantages enable Chicago to control 85 per cent of the export freight business.

The witness admits that there will always be, under any circumstances, some advantage to Chicago in securing a large tonnage, on account of its location and its lake transportation, although export trade by way of the Mississippi River and the Gulf railroads is helping St. Louis to keep up its business. (194, 197-199, 206.)

6. *Discriminations against Kansas City.*—Mr. BOOKWALTER states that grain rates to Kansas City are disproportionately high as compared with the rates to points east and south. The town of Wahoo is 229 miles from Kansas City and 523 miles from St. Louis, and is reached by the Burlington and the Union Pacific. The rate from Wahoo to Kansas City is 14 cents, and to St. Louis it is also 14 cents. Grain can be shipped by the Union Pacific through Kansas City to St. Louis for 14 cents, but if it is billed to Kansas City and then rebilled to St. Louis the charge is 21 cents, the proportion accruing to the Union Pacific being 7 and 14 cents, respectively. From Doniphan, Kans., the rate on corn to Kansas City, 50 miles, is 7 cents. The rate to Chicago by way of St. Joseph, 522 miles, is 15 cents. The rate to Chicago by way of Kansas City, 43 miles farther, is 19 cents. The rate to St. Louis by way of Kansas City is 14 cents. The rate from Humboldt to Kansas City, 120 miles, is 8 cents. The rate to Chicago, 571 miles, is 17½ cents. Shepard, Iowa, on the Maple Leaf, is 167 miles from Kansas City, and grain billed from that point to St. Louis would be hauled through Kansas City in order that Maple Leaf might get the full amount of their mileage. The rate for the 167 miles to Kansas City is 10 cents; for the 528 miles to St. Louis it is 12 cents. (572-576.)

Mr. Bookwalter states also that Kansas City is discriminated against in favor of other towns on the same lines of road, in that grain can not be stopped in transit at Kansas City without an additional charge of from 1 cent to 7 cents a hundred. There is a switching charge besides, if the car is transferred from

one road to another. At other points, like Topeka, there is no additional charge for stopping and milling in transit and there is no switching charge. This discrimination ruins both the grain business and the milling business of Kansas City. The local mills can pay more for grain than Kansas City millers, because they can manufacture it for export equally well, and they have an advantage in the total freight. A representative of Armour & Co. stated, in an investigation relative to the New York grain business, that one-sixteenth of a cent per bushel will determine where grain shall go. It is now impossible for Kansas City to handle grain, except for local consumption, and except poor grades that can not be sent to more distant markets.

The witness says further that a great deal of both oatmeal and corn meal used to be manufactured at Kansas City for the Southern market. Oats for oatmeal come chiefly from the central portion of Nebraska, where the white oats, which are desirable for oatmeal, are largely raised. The rate on oats from Wahoo to Kansas City, 229 miles, is 14 cents; the rate from Wahoo to Memphis, directly through Kansas City, is 19 cents, 5 cents for an additional 484 miles. If the oats are billed to Kansas City and then billed to Memphis the rate is 24 cents, a penalty of 5 cents for stopping and manufacturing at Kansas City. The oatmeal mill at Kansas City can not now get oats to run more than a small part of the time. Kansas City used to send a great deal of corn meal to Texas. The rate from Wahoo to San Antonio is 39 cents. If the corn is stopped at Kansas City and manufactured the rate is 44 cents. As a result, the corn is now shipped to Texas and manufactured there. Mr. Bookwalter does not think it is more expensive to carry the manufactured product than to carry the grain. The difference of charge between the grain and the manufactured product has been in force only about 2 years. (570-573.) (Compare *Export and domestic grain and flour rates*, p. 74.)

Mr. Bookwalter thinks that the grain tributary to Kansas City is diverted less to St. Louis than to Chicago and the South. When local market conditions make it better to send to Galveston, very little is handled in the Santa Fe elevator at Kansas City; if it is best to send to Chicago, very little is handled in the Rock Island elevator.

The witness believes the policy of discrimination against Kansas City has been dictated by the desire of the through roads to carry grain as far as possible on their own lines. However, the Union Pacific, which ends at Kansas City, makes the same discriminations in favor of other markets which are made by the roads which run to those markets. It is compelled to accept the terms made by the other roads, because, if it did not, they would revenge themselves upon it elsewhere. (572, 577.)

7. *Discriminations against Milwaukee.*—Mr. BACON, representing the Milwaukee Board of Trade, testifies that the Interstate Commerce Commission in 1898 issued an order requiring the reduction of differentials granted on grain shipments in favor of Minneapolis as compared with Milwaukee. The differential as fixed by the commission would just about equal the excess in the cost of transportation from Minneapolis to the seaboard. The railroad companies, after some delay, reduced their differentials, but only about one-half as much as the order of the commission required. The commission reaffirmed its order, but the railways failed to conform to it. This is due to the influence of the Chicago and Northwestern Railroad, which controls the Chicago, Minneapolis and Omaha Railway, and therefore finds it advantageous to favor Minneapolis. (418.)

8. *Discriminations against La Crosse.*—Mr. DICKINSON, of La Crosse, Wis., a manufacturer of agricultural implements, states that La Crosse and Chicago are at practically the same distance from Madison, Wis., but that his concern found itself unable to do business in Madison. On investigation he discovered that while the rate from La Crosse to Madison was 19 cents a hundred on agricultural implements and vehicles by the carload, the rate from Chicago was 12½ cents. After much trouble he succeeded in getting the rate from La Crosse reduced to 12½ cents. He then discovered that there had for some time been in existence a rate of 8 or 8½ cents on the same class of goods between Madison and Chicago; and that while the third-class rate from La Crosse to Madison was 28 cents a hundred, Chicago and Milwaukee had a rate on all kinds of agricultural machinery, in less than carloads, of 15 cents per 100. These discriminations made it impossible for manufacturers and dealers in La Crosse to do business in the territory referred to. La Crosse establishments succeeded in getting these special rates in favor of their competitors abolished; but one of the roads renewed the discriminating reduction, and it then continued until within 2 months of the time of Mr. Dickinson's testimony, although it was then abolished again. Mr. Dickinson believes that the only way in which such difficulties and injustices can be avoided is by increasing the power of the Interstate Commerce Commission. (549.)

9. *Discriminations in Nebraska.*—Mr. FULLER, of Norfolk, Nebr., declares that that city is discriminated against by the railroads. It has a population of about 5,000, while Fremont, the nearest large town, has a population of about 10,000. Norfolk stands practically alone in a territory having a radius of 75 miles. It has railroads diverging in 5 directions. Norfolk has grown very slowly, while Fremont has grown steadily, and this fact is to be attributed to the advantages given to Fremont manufacturers and jobbers in freight rates. Thus Fremont is given a through rate from Chicago and Eastern points the same as the rate to the Missouri River, while 45 cents per hundred, first class, is added to the Missouri River rate for shipments to Norfolk. So, too, the local rates, especially from Sioux City to Norfolk, are higher than those from Sioux City to many other points. The rate per ton per mile on first-class freight from Sioux City to Norfolk, 75 miles, is 12 cents; from Sioux City to Alcester, S. Dak., 77 miles, 7.79 cents; from Lincoln to Dakota City, Nebr., 78 miles, 6.41 cents; from Sioux City to Beemer, Iowa, 168 miles, 5.24 cents. The witness thinks that these differences in rates are not justifiable on any ground. The railways claim that the lower rates accorded to Fremont are due to competition. The Nebraska railroad commissioners, when appealed to, have held that the discriminations complained of were on interstate business and not subject to their jurisdiction. The matter has not yet been acted upon by the Interstate Commerce Commission. (442-446.)

10. *Pacific coast traffic and Colorado points.*—Mr. VANLANDINGHAM says that the freight rates to the Pacific coast, from all parts of the East as far as the Mississippi River, are the same, an arrangement which takes away from the nearer points their advantage of location in selling goods to the Far West. This arrangement is explainable largely by the competition of water transportation from the Eastern seaboard to the Pacific coast. Goods are sometimes shipped from St. Louis to New York and thence to the Pacific States by vessel. There is no direct transportation by water from Gulf points to the Pacific coast. The Southern Pacific Railway Company owns the Morgan Line of steamships, running from New York to New Orleans and Galveston. By the economy of water transportation that railroad is able to handle 65 per cent of all the traffic from the East to Pacific coast points as far north as San Francisco, and to dictate rates upon the other railroads practically as far north as Portland. (207, 208.)

Mr. KINDERL, manufacturer, of Denver, declares that there are very many serious discriminations in rates against Colorado points, especially as compared with Pacific coast points. Up to 1895, for example, the railroads hauled rails from Chicago through Colorado to San Francisco for 60 cents per 100, while the Colorado Fuel and Iron Company was charged \$1.60 for a haul 1,000 miles shorter. This discrimination has been checked by an order of the Interstate Commerce Commission, that the rates from Pueblo to California shall not exceed 75 per cent of the rates from Chicago. The witness has been driven out of the manufacture of upholstering goods and of spring beds in Denver because of similar differences. He wished to manufacture albums in Denver, but was forced to locate in Chicago because the freight rate on books from Chicago to San Francisco was \$1.75 per 100 and from Denver to San Francisco \$3, while the Denver manufacturer had to pay 37 cents freight on his raw material from Chicago to Denver. So, too, the freight rate on books from Chicago to New York is 75 cents, from Denver to New York \$2.72. The difference in rates on coal oil has been so great that oil has sometimes been shipped from Chicago to San Francisco and back again to Denver. (See *Standard Oil Company*, p. 52.)

Other discriminating rates mentioned by the witness are as follows: Sugar is carried from San Francisco to Denver at 75 cents; to Omaha at 50 cents. Boots and shoes are carried from Chicago to Colorado common points at \$2.05 per 100; California at \$1.50 per 100. If a jobber in Colorado wishes to ship boots and shoes to California he must pay \$3, making a total freight rate of \$5.05 from Chicago to California in this way. Cotton piece goods under commodity rates are shipped from Boston to the Missouri River for 52 cents per 100, while the rate from the Missouri River to Denver is \$1.25 for a haul of one-third the distance. The rate through Denver to California is only \$1.

It appears that many of these discriminations referred to by the witness arise from special commodity rates outside of the regular classification rates; but even as to these latter rates there are marked differences. On first and second class goods the transcontinental rate is now the same as that from the seaboard to Denver. On the other classes the tariffs are, respectively, Denver, \$2, California, \$2.20; Denver, \$1.75, California, \$1.90; \$1.60 and \$1.50, \$1.40 and \$1.45, \$1.20 and \$1.25.

Mr. Kinderl says, further, that whereas the railroads have admitted that freight can be hauled profitably at 2½ mills per ton per mile, Colorado rates are as high as 91 mills per ton per mile.

The explanation advanced by the railways regarding the lower freight rates to the Pacific coast—that they are necessary on account of water competition—is, Mr. Kindel thinks, only partly to be accepted. This would not justify the through rate from the Missouri River to the Pacific coast of only 50 cents on certain products, on which the rate is 75 cents from New York. Moreover, there are discriminations in favor of Salt Lake City on shipments from Eastern points as compared with Denver. These apparently arise largely from the granting of commodity rates on certain products to Salt Lake which are refused to Colorado. Thus the machinery manufactured at Chicago is shipped to Salt Lake at the same rate as to Denver, and owing to the difference in local rates it is cheaper for the buyer at Grand Junction, Colo., to secure his machinery from Salt Lake than from Denver, which is nearer. The third-class rate from the Missouri River to Colorado on ordinary commodities is 80 cents, to Utah common points, \$1.55; but on oilcloth and linoleum, for example, Utah has a commodity tariff of only \$1.09, the same articles being shipped to California at 75 cents.

As a matter of fact, the witness thinks the Southern Pacific Railway practically dictates California rates from the East, and it is largely for this reason that rates discriminate against Colorado.

The effects of this system, Mr. Kindel declares, have been largely to destroy the manufactures of Colorado, and to a considerable extent the jobbing business also. Only those persons are successful in business in Colorado who secure discriminating rates below the published tariffs. The witness admits that he himself obtains such rates and is thus able to continue business, but deprecates the necessity of thus violating the law. He believes that the reason why the Denver Board of Trade has not only raised no objection to the discrimination against that city, but itself petitioned the Interstate Commerce Commission to exempt Colorado from the provisions of the long and short haul clause of the interstate-commerce act, is that that body is composed of the wealthier manufacturers and dealers, practically all of whom receive large rebates from the railways. There are a number of jobbing houses in Denver which are raising no complaints, but the witness believes it is for this same reason. As a matter of fact, the discriminations have driven a great many jobbing houses out of business. Especially representatives of large Eastern firms have withdrawn their houses to Missouri River points, whence they ship directly to California retail stations. They are able to do this profitably, because the railways permit them to stop off their cars at one station after another, paying through freight rates to the last station.

The manufactures of Colorado, the witness believes, have been largely destroyed by these discriminations. Thus woolen mills, glass mills, and a large paper mill have been driven out. Colorado has cheap wool and coal, and should be able to manufacture many classes of goods. In the case of the paper mill referred to, the railways lowered the freight rate on paper immediately after it was started from more than \$1 to 25 cents per hundredweight. The witness quotes Gen. Irving Hale to the effect that it is essentially the discriminating freight rates which have prevented the growth of Colorado manufacturing industry.

The witness admits that the smelting industry in Colorado is in a prosperous condition, and makes no complaints regarding freight rates. He attributes this fact largely to the interest which the officers of the railroads themselves have in mining and smelting works. It is true, also, that a cotton factory is successfully operated at Denver, cotton being hauled from Texas at fair rates.

On being questioned as to the motive of the railways in thus discriminating against the industries of Colorado, Mr. Kindel says that most of the directors and other officers, even of railways having their termini at Denver, live in New York and give little thought to the prosperity of Colorado.

The witness at first stated that unfavorable freight rates had largely prevented the exportation of agricultural products from Colorado. He afterwards admitted, however, that large quantities of flour, cattle, horses, potatoes, and melons are exported; that the agricultural production of that State was on the whole increasing, and that the State in any case has to import certain of its agricultural products from Nebraska and Kansas.

Mr. Kindel also refers to alleged discriminations in local rates, as between Denver and Pueblo. Shippers of the latter city complain that they are discriminated against. The witness does not attach much weight to this statement, though he admits that sometimes rates from Denver are adjusted so that goods can be shipped through Pueblo at the same cost as if shipped directly from Pueblo.

The railroad commission which formerly existed in Colorado was abolished in 1893, under the influence, Mr. Kindel claims, of the railways. The officers of railroads take active part in Colorado politics and have great influence. (251-264.)

D. Discriminating import rates.—Mr. REAGAN, of the Texas railroad commission, refers to the complaint brought before the Interstate Commerce Commission in 1889 as to the practice of the Pennsylvania Railroad and other railroads in charging lower rates, even 50 per cent lower, on goods carried under through bills of lading from foreign ports than on domestic traffic. The defendant substantially admitted the facts, and the commission ordered the discriminations to cease, holding that the interstate-commerce law applied to such shipments. This decision was upheld by the circuit court and the circuit court of appeals, but was reversed by the Supreme Court of the United States, although the Chief Justice and two other justices dissented. Justice Harlan, in his dissenting opinion, stated that the records showed that the rates on certain classes of goods from Liverpool to San Francisco by way of New Orleans were 102 cents per hundred pounds, while the rates from New Orleans to San Francisco over the same railroads were 288 and even 370 cents per hundred. Mr. Reagan thinks that Congress should legislate or remedy the lack of power in this direction.

Mr. Reagan quotes from the opinion of the Interstate Commerce Commission above referred to, to the effect that the authority of the United States to regulate is strictly limited to the territory of the United States. He suggests, without making the matter entirely clear, that the decision of the court permitting through freight rates on imported goods at rates lower than the domestic rates involves an extension of the power of the court outside of the limits of the United States. (340, 349.)

Mr. KELLEY, freight commissioner of the Trades League of Philadelphia, and Mr. VANLANDINGHAM, freight commissioner of the St. Louis Traffic Bureau, likewise believe that injustice is done by allowing lower freight rates on imported goods than on domestic shipments. Rates are so arranged in many cases that goods can be shipped from Liverpool to Western points for less than the freight from New York to Chicago, St. Louis, or Kansas City. These special rates are made by agreements between the foreign shipper, the ocean line, and the railway company, with a view to enabling goods to be shipped which would otherwise not be shipped at all. (187, 205.)

Mr. KINDEL, a manufacturer of Denver, also refers to the fact that goods can be brought to that city from Liverpool by way of Gulf ports very much cheaper than from New York and other Eastern points, which forces buyers to patronize the foreign product. (260.)

Mr. PROUTY also testifies that the freight rates on goods imported from other countries are often lower than those on domestic goods. Thus the rates from Liverpool to San Francisco through New Orleans on many articles are not more than one-half the rates from New Orleans to San Francisco. (146, 151.)

Mr. MORTON, of the Atchison, Topeka and Santa Fe, declares that he has known instances where goods have been carried from Hamburg to Denver for less than the rates from Chicago to Denver, an unnecessary discrimination against American producers. On the other hand, where the rate is from Hamburg to San Francisco, the goods going entirely by water, the question of fair rates becomes a different one. (490, 493.)

V. EXPORT AND DOMESTIC GRAIN AND FLOUR RATES.

A. Existence of differences in rates.—Mr. KNAPP, of the Interstate Commerce Commission, refers to the differences in freight rates between grain intended for exportation, on the one hand, and grain intended for domestic consumption and flour on the other, and Mr. PROUTY describes them more in detail. The Interstate Commerce Commission has held that railways are bound to publish schedule rates in the case of export traffic, although the railways have objected to this position. A recent investigation showed that the freight on wheat from Kansas City to Galveston, if the wheat was intended for domestic use, was 27 cents, while the rate on wheat intended for exportation was 10 cents. From the Mississippi River to New York the rate on domestic wheat was 20 or 21 cents, on export wheat 12 or 13 cents. By similar differences between the rate on export wheat and that on flour ground in this country, whether intended for domestic or export use, a Chicago miller, for example, would have to pay about 21 cents per 100 pounds to get either wheat or flour to New York, while the English miller could take his wheat to New York from Chicago for 13 cents. The freight rate on flour in some instances was as much as 11 cents more than that on wheat. Since a rate of profit of from 2 to 3 cents per 100 pounds of flour is regarded as a good one, our millers could not grind for the export trade against such a discrimination. (134, 142, 146.)

The Interstate Commerce Commission issued an order on August 7, 1899, that the difference between export rates on wheat and flour rates should not exceed 2 cents per 100 pounds and declaring that public policy demanded that they should be the same. The railways appear to have conformed in part to this order, but after some delay.

Mr. VANLANDINGHAM, of the St. Louis Traffic Bureau, submitted the following statement as to the differences in effect September 18, 1899: From East St. Louis the rate on domestic grain to Newport News, Norfolk, and Baltimore, except on corn and corn products, was 20 cents, and on corn and corn products 18 cents; for export the rate on corn, wheat, barley, and rye was 13½ cents. From Chicago the domestic rate on grain and products was 17 cents, and on corn and corn products 15 cents; for export corn, wheat, barley, and rye, 12½ cents; oats, 14½ cents. To Philadelphia the rate on domestic grain was 21 cents from East St. Louis; corn products, 19 cents; export corn, wheat, barley, and rye, 14 cents; oats, 16 cents; from Chicago, domestic, 18 and 16; export, 13 and 15. To New York, domestic, from East St. Louis, 23 and 21; export, 15 and 17; from Chicago, domestic, 20 and 18; export, 14 and 16. The differences on shipments to Gulf ports were even greater. (195.)

The witness also submitted the following table showing the differences in rates on flour and wheat existing under the tariff adopted September 18, 1899 (195):

| | Flour. | Wheat. | Difference in favor of wheat. |
|--|--------|--------|-------------------------------------|
| | Cents. | Cents. | Cents. |
| From East St. Louis, when from beyond, to— | | | |
| Baltimore..... | 20 | 13½ | 6½ |
| Philadelphia..... | 21 | 14 | 7 |
| New York..... | 23½ | 15 | 8 |
| Boston..... | 23 | 15 | 8 |
| Portland..... | 23 | 15 | 8 |

These differences Mr. Vanlandingham considers excessive, but he doubts the power of the Interstate Commerce Commission to control export rates.

Mr. INALLS, of the Chesapeake and Ohio Railroad, testifying on October 16, 1899, speaks of a recent reduction of the difference between rates on wheat and flour, but is doubtful whether this is so much the result of the decision of the Interstate Commerce Commission as of the increase of rates on wheat by agreements among railways, made possible by the exceedingly large demand for transportation. (300, 301.)

Mr. BACON, a grain merchant of Milwaukee, testifying in November, 1899, says that changes were made in the freight rates on grain and flour November 1. Both were advanced, but the rate on grain was advanced the more, so that the difference between export grain and flour rates from Chicago and Milwaukee to the seaboard is only 2 cents per 100 pounds, as prescribed by the Interstate Commerce Commission, and there is the same difference between rates on export grain and domestic grain. Nevertheless, millers at Chicago or Milwaukee are still at a considerable disadvantage, owing to the fact that through export rates from the Mississippi River and farther western points to New York are considerably less than the domestic rate on grain to Chicago or Milwaukee plus the rate on the manufactured product to the seaboard. The witness presented a table showing that it would cost from 4 to 7 cents per 100 less to send wheat from Columbus, Nebr., Sioux City, and other Iowa points to New York than to send the same wheat to Chicago and the flour made therefrom to New York. Another table shows that it would cost from 4 to 5½ cents less to send grain from these same points to New York for export than for domestic use. Milling-in-transit rates are not granted on grain for export purposes. (422-425.)

Mr. SAGER, secretary of the Northern Milling Company of Chicago, confirms the testimony of Mr. Bacon as to the existing differences in the freight rates on flour and grain. The differences are much less than those which formerly existed. Nevertheless, the Chicago miller has to pay the local rate of about 5 cents per 100 on grain from the Mississippi River to Chicago, and in addition must pay 2 cents per 100 more on flour from Chicago to the seaboard than the export rate on wheat from the Mississippi River to the seaboard, which is the same as that from Chicago. (446, 447.)

Mr. EVANS, a miller of Indianapolis, testifying in November, 1899, says that the rates from Chicago to the seaboard since November 1, 1899, have been 20 cents

for grain and 22 cents for grain products, and from the Mississippi River 20 cents and 24 cents, respectively. Even with the discrimination between grain and grain products thus reduced the effect upon flour and corn mills in the interior cities is still serious. The witness submitted a table showing that the cost of delivering corn, at an original price of 30 cents per bushel, in New York for export purposes would be 76.07 cents per 100 pounds. If the corn be ground in Indianapolis, paying a milling privilege of $1\frac{1}{4}$ cents per 100 pounds and the higher freight rate on milled products, it would cost 79.07 cents to deliver it in New York. (435, 436.)

Mr. GALLAGHER states that there had been for months up to November, 1899, a gradually increasing discrimination between wheat for export and flour for export. He believes that it was at one time 8 cents, before that 5 cents, and before that 3 cents. In the tariff dated November 1, 1899, the rate on flour for export from St. Louis to New York is 27 cents, to Philadelphia 25 cents, and to Baltimore 24 cents; on wheat for export the rate to New York is 20 cents, to Philadelphia 19 cents, and to Baltimore $18\frac{1}{4}$ cents. Though the railroads claim that the commission has no authority to make such orders at will, they have issued a tariff which complies with its order, so far as rates from Chicago are concerned. The export rate from Chicago is now only 2 cents higher on flour than on wheat. The discrimination in other parts of the country, including St. Louis, is as great as before. The new Chicago rate was made on November 1, at a time when rates generally were advanced. The rate on flour was not reduced, but the discrimination was reduced by advancing the rate on wheat. (539, 540.)

B. Effect of differences on American millers.—Mr. BARRY, secretary of the Millers' National Association, is fullest in his description of the effects of these discriminating rates on American millers. His testimony was given before the change of rates in November.

The millers' association was organized in 1873, primarily for the purpose of checking litigation concerning patents and saving expense in that regard. Since 1890 it has acted in other directions for the benefit of the trade, urging pure-food laws, considering tariff measures, etc., and it is now active in opposing these discriminations. It has not sought to influence prices, and can never do so, since the interests associated are so diverse. The organization is affiliated with various State organizations of millers. It has a membership in 24 States, its members having 120,000 barrels daily capacity. In certain European countries the organizations of millers include even a larger proportion of those engaged in the industry and are more effective. (240-243.)

Mr. Barry calls attention to the great importance of the milling industry in this country and to the fact that it is widely scattered, including many small producers. The capacity of the mills of the country is excessive, which renders the export trade of even greater importance than it would be otherwise. Competition has driven millers to increase the size of their plants in order to reduce cost, so that it is estimated that the mills could in 90 days make into flour every bushel of wheat raised in a year.

Mr. Barry further says that up to within two years there have been practically the same freight rates on flour and wheat for both domestic and export use. The growing disparity has come about by the decrease in the export rates on wheat, the flour rate remaining practically the same. The witness cited as one instance the fact that the export rate on flour from Missouri River points by way of Chicago has been $21\frac{1}{4}$ cents to the seaboard; the export rate on wheat only 12 cents. The effect of this discrimination must be serious upon the milling industry. Although the exportation of wheat has been larger during 1899 than during 1898, the amount of flour exported from Minneapolis during the month of September, 1899, was 362,810 barrels, as compared with 485,534 in September, 1898. Exportation from Duluth for the same months has been 79,395 barrels and 173,135 barrels, respectively, showing a net decrease of 93,830. The most serious effect is likely to be on the small millers. They can not manufacture as cheaply as the large Minneapolis and other mills, and these, if excluded from foreign markets, will sell their surplus product in competition with the small mills. The witness quoted a letter from a London dealer which declares that the discrimination against flour is undoubtedly injuring the American trade and is a fine thing for the English miller, having the same effect as if the English Government should place a duty of perhaps 6 cents per 100 pounds on flour. It is often difficult for American millers to dispose of their by-products satisfactorily, and though bran can now be packed in very condensed form for transportation, the low export rate on wheat prevents a good foreign market for American bran. (240-243, 246.)

Mr. VANLANDINGHAM thinks that if the present discriminations continue flour shipments will be very largely prevented. As a matter of fact, they have increased much less rapidly than grain shipments during the past four years, and were even lower in 1898 than in 1894, as shown by the following table: (204, 205.)

| Year. | Wheat. | Flour. |
|------------|-----------------|-----------------|
| | <i>Bushels.</i> | <i>Barrels.</i> |
| 1894 | 88,415,280 | 16,859,533 |
| 1895 | 70,102,704 | 15,268,862 |
| 1896 | 60,650,080 | 14,620,864 |
| 1897 | 79,562,020 | 14,569,545 |
| 1898 | 148,231,261 | 15,349,943 |

The effect of this discrimination, if continued, Mr. SAGER declares, must be ultimately to destroy the American industry of milling for export. At present the reputation of American brands prevents them from being entirely shut out from the foreign market. But when foreign consumers find that millers on their own side can furnish them with flour made from the best American wheat at a lower price, the American trade will be lost. The foreign millers have cheaper labor and the cost of their plants is less. The American export trade in flour has grown steadily and has been very large, but the mill in which the witness is interested, at any rate, has never done so little export business as during 1899. The fact that official statistics show that the export of flour for the first 9 months of 1899 was somewhat greater than for the first 9 months of 1898 is explained by the existence of many contracts made in 1898 which had to be filled in the spring of 1899, as well as by the fact that a large amount of export flour went to the seaboard in the fall of 1898, but was not shipped until 1899. The millers of the country think that Congress should come to their aid in protecting the American industry, especially for the sake of American labor. (447, 448, 453.)

Mr. GALLAGHER states that our flour export trade has rapidly diminished since February, 1899. The St. Louis miller has to pay what is practically an export duty of 7 cents per 100 pounds, or about 15 cents a barrel, on his flour. This the American miller can not afford to do; his profit is not so great. The American miller is under some natural disadvantages as compared with the foreign miller using American grain. The export grain goes directly from the field toward the sea. The miller often has to ship his grain 200 or 300 miles at local rates and perhaps away from the sea. The milling-in-transit privilege sometimes modifies this disadvantage, but does not overcome it, and this privilege does not exist generally, but only in certain territories. (539, 545, 546.)

Mr. Gallagher says, further, that St. Louis has manufactured soft-wheat flour for export for 50 years or more. When the crop fails in the district from which the St. Louis mills are accustomed to buy, they have to go to Indiana, or even to Ohio or to Chicago, for wheat. The mills of St. Louis and its suburban towns have a capacity of over 27,000 barrels per day, and employ 1,100 men exclusively engaged in that business, besides truck drivers, men working in the mills, etc. The consumption of wheat is much larger in St. Louis than in Chicago.

Mr. EVANS says that the result of the discriminations which have existed during 1899 has been to divert trade very largely from American mills and to favor foreign mills, both as regards corn products and as regards flour. The witness quoted from various letters from dealers in English cities and in Amsterdam referring to the impossibility of selling American products in competition with the existing low prices of the foreign mills. There has never been a time in the past 20 years when the mills have been so largely shut down or running on half time. This means a loss to many classes of people, especially to the employees of the mills. On the other hand, the witness has been told that the English mills are running at a rate never before known. (437.)

C. Are lower export rates justifiable?—Affirmative.—Mr. NEALL, a shipping merchant of Philadelphia, believes that it is justifiable to charge lower freight rates on goods intended for exportation than on those for domestic use. This practice benefits the producer, notably the farmer. If the farmer sought to force the large surplus production of corn and wheat down the mouths of the inhabitants of the United States, who are all sufficiently supplied, the price would be materially cut down. In the foreign market grain can be sold only if the price is made low enough to compete with the products of Argentina, Russia, and Hungary. (166.)

Mr. KELLEY agrees with Mr. Neall in justifying the lower rates on goods intended for export than on other goods. (188.)

Mr. CALLAWAY, president of the New York Central, also thinks that low export rates are necessary to meet foreign competition, and that the ability to dispose of surplus products, especially of grain, in this way is a great advantage to American producers. If the railways were compelled to make domestic rates as low as those frequently necessary for export, they would have to go out of the export business. But the proportion of the export business is enormous. About 80 per cent of the provisions shipped from the West to the seaboard go abroad, and practically all of the grain. Mr. Callaway does not admit that the railways haul export goods at a loss. No intelligent man would take traffic which did not pay a reasonable profit. But the entire bulk of a railway's business must be averaged in calculating profit. Thus the New York Central carries about 15,000 freight cars per day. If the number were reduced to 10,000 at the same rates the railroad probably could not live. The margin, however, on export traffic is often exceedingly small. (232-234.)

Mr. SPENCER, president of the Southern Railway, states the argument in favor of permitting lower export rates in very much the same terms. If the domestic rate itself is reasonable, all things considered, no one is harmed by making a special export rate, necessary to meet competition in foreign markets. The only possible harm would come to the railway in case it made the rate too low. The recent competition of transportation by way of the Gulf has compelled the reduction of rates from Chicago and St. Louis to the Eastern seaboard, although the effect of this competition has probably been exaggerated. (276, 281.)

Mr. FISHER, of the Illinois Central, says the practice of the railways in making lower export rates is similar to that of manufacturers who try to keep foreign markets in order to relieve themselves of surplus product, even at a loss. Railways must either lose the business entirely, and American producers lose foreign markets, or special rates must be made. In the case of the Illinois Central, although about 85 per cent of the total tonnage is local, most of the grain hauled to New Orleans is for export. The export business also is done more economically than the local business. Shipments are made by train loads, and the cars are unloaded very promptly, whereas in the case of local shipments they are often delayed several days. (336, 337.)

Mr. TUCKER, chairman of the Central Freight Association, considers that it is proper to make a lower rate on grain for export, just as manufacturing concerns or mines sell their surplus at lower rates than they charge to their regular customers. A low export rate on grain enables the surplus crop to be got rid of, meets foreign competition which does not have to be met in local traffic, and is on the whole the best policy for the country at large. Besides, the export traffic is very large in volume; both export grain and export flour can be moved in heavy carloads, and so can be moved with fully as much profit to the railroad as other freight in smaller volume. (563.)

Mr. SNYDER, a grain merchant of Chicago, thinks also that it is just and desirable to make freight rates for export grain such as to enable American grain to compete in foreign markets. He believes it to be a serious offense to divert grain to domestic consumption when it has been billed for exportation at a lower rate. (398.)

Mr. BLANCHARD, late commissioner of the Joint Traffic Association, presents a similar line of argument in favor of lower export rates. He thinks that such special rates are justifiable, not only as regards grain, but also as regards flour, cattle, meat products, cotton, tobacco, and much other exported merchandise. Lower rates are often necessary to meet foreign competition, and there is no good reason why the domestic rates, if reasonable in themselves, should be reduced on account of the reductions in export rates, especially since a reduction of domestic through rates carries with it many intermediate rates. The present practice helps all of the producing interests of the country.

Mr. Blanchard adds that the competition of Canadian carriers for American grain often makes it necessary to reduce rates on export shipments, a similar reduction not being necessary on domestic shipments.

This witness points out further that a considerable amount of grain and similar products goes abroad on through bills of lading from inland points to foreign ports. It may be greatly to the national advantage to make such through rates. On account of the frequent changes in ocean rates, a through rate which is disadvantageous to a port at one time may very soon become beneficial to it. (628, 629.)

Mr. GALLAGHER thinks that the roads are justified in making the rates on grain and flour for export lower than the rates on the same things for domestic use. (513.)

Negative.—Mr. PROUTY, of the Interstate Commerce Commission, says that although the railways have assigned as a justification for such discriminations the necessity of meeting competition in markets abroad, investigation by the commission showed that this claim was not justified, but that the discriminations had been due to competition among the railways at home. The American farmer therefore received no benefit, the foreign consumer reaping the entire advantage.

These discriminations are partly defended on the score of water competition; for example, by way of Montreal. How far the railways succeed in recouping themselves by such low rates can not be estimated. The fixed charges must be paid in any case, and the additional cost of handling an increased amount of business can not be estimated by itself. The low rate from Kansas City to Galveston was defended on the ground that the ocean rate from there to Liverpool was higher than from New York. The commission, at any rate, ordered that the rate on flour or on grain for domestic use should not exceed the export grain rate by over 2 cents. (146, 147.)

Mr. GALLAGHER thinks lower export rates in themselves advantageous to farmers, but declares that grain is bought up by railroads and elevators and run out of the country by the train load, taking advantage of a rate, often secret, which the farmer gets nothing out of. (540, 541.)

Mr. VANLANDINGHAM, freight commissioner of the St. Louis Traffic Bureau, considers that at some periods a lower export rate is doubtless necessary to secure foreign markets against competition of other countries. The railways are sometimes unable to make the domestic rates as low as the export rates which are necessary. But this has not been true during 1898 and 1899, since our grain would have gone abroad to as great an extent in any case. (195.)

Mr. MORRIS, vice-president of the Atchison, Topeka and Santa Fe Railway, does not think that lower rates on imported or exported articles than on domestic traffic are usually justifiable. The recent low rates on export traffic have been caused by excessive competition among American carriers, and not by the necessity of meeting foreign competition. There must be some elasticity in the rates on manufactured goods, since we are only beginning to extend our foreign markets largely. America can produce cereals as cheaply as any country, and there is no need for low export rates on them. (490.)

Mr. BARRY does not think that the exceedingly low export rates on wheat are necessary in order to enable American products to compete in foreign markets. He thinks the cost of transportation in this country tends to determine the Liverpool price of wheat, rather than that that price determines the transportation charges. He admits that the Liverpool price of grain largely determines the American price. He insists, however, that there is demand for American wheat regardless of the competition of other countries, on account of its superior quality, and especially that American flour has a preference among foreign consumers. It would be to the advantage of the American grain producer to sell his product as far as possible to American mills, since the foreign demand for American flour is steadier than that for wheat and would tend to keep up the price of wheat. (247-251.)

Mr. BACON does not consider lower rates on export shipments of grain justifiable. They have never been considered necessary until within the past two years. They are not essential to hold European markets. The price in Liverpool is only one of many elements in fixing prices to American producers. Even if rates on flour and grain be made the same, the existence of an export rate lower than the domestic rate would at least injure millers on our eastern seaboard. (424, 425.)

D. Are lower rates on grain than on flour justifiable?—*Affirmative.*—Mr. CALLAWAY, president of the New York Central, thinks that flour will bear a higher freight rate than grain. At any rate, there is no considerable profit in hauling flour at present rates (October, 1899). The competition is very keen, especially since the "Soo Line" was built from Minneapolis directly to tide water. Water competition also keeps rates on flour down. The witness believes that his own road has complied with any finding the Interstate Commerce Commission may have made on this subject. It is the purpose of the railways to foster traffic, and if it be found that American flour industries are being repressed by rail rates, the rates will be reduced. But the millers continue to ship at present rates and are making money. (232, 233.)

Mr. BRUB, of the Chicago, Milwaukee and St. Paul, thinks that the interstate-commerce act does not apply to export business. The lower rates which are often made on wheat as compared with flour are partly explainable, in his opinion, by the fact that water competition is specially strong in the case of wheat, and water carriers are not subject to the interstate-commerce act. At the same time

the recent specially low export rates on wheat were due essentially to the contest for supremacy between the various trunk lines. The witness does not believe that the ownership of terminal facilities by railway officers has had anything to do with it. A further justification for lower rates on grain may be found in the fact that a heavier load of grain can be shipped in a car than is usually shipped of flour. Nevertheless, Mr. Bird sees no reason why, other conditions being equal, wheat grown in the Northwestern States should be carried for export at so cheap a rate that the foreign miller can compete with our own millers in grinding American wheat. (473, 474.)

In explanation of the fact that the difference between the rates on export grain and on flour is greater from the Mississippi River points to the seaboard than from Chicago, and greater than the limit prescribed by the Interstate Commerce Commission, Mr. Bird stated that the Western roads could not reduce their through rates without the cooperation of the Eastern roads, especially, apparently, of those which run directly from the Mississippi River to the coast. (477.)

Mr. TUCKER, chairman of the Central Freight Association, says that transportation rates are really based on value, bulk, and risk. The terminal expense is another element to be considered in determining the rates. The manufactured article should always be charged more than the raw material, and, as a rule, it is of less weight in proportion to bulk. Export flour is sent from Minneapolis in carloads about two-thirds as large, he thinks, as carloads of wheat. He is not clear whether the railroads may not be in part responsible for this by furnishing smaller cars for flour than for wheat. It is a matter of evidence that the export flour is worth just about as much as wheat; but the witness queries whether this may not result from using a poor wheat for export flour. The witness does not believe that the railroads are themselves owners of wheat, and therefore discriminate against American flour. He does not think that such a thing could long continue without its being known to those not in it. (563, 564.)

Mr. BLANCHARD is not clear as to whether differences between rates on wheat and flour are entirely new developments or have long been in existence. He thinks that such differences are justifiable. He has, indeed, heretofore heard of complaints made by grain shippers on the ground that the railways carry a barrel of flour weighing 216 pounds at the same rate as 200 pounds of wheat (presumably on domestic shipments). He thinks that it is the intention of the carrying companies to put the two articles on the same footing wherever practicable. He suggests that the lake vessels are able to handle wheat much more economically than flour, and that the railroads are compelled to meet their rates. He thinks it is also cheaper for the railways themselves to handle bulk grain than flour. The loads are heavier.

Mr. Blanchard says further that the railways, at least at New York, by contract with the New York Produce Exchange, deliver bulk grain in canal boats or otherwise at the ocean vessels themselves, including storage, without extra charge, and apparently this is not the case with flour. It is not true, as is sometimes contended, that there is a charge of 3 cents per 100 pounds for this transfer of grain, and that the fact that railway officers are interested in the transfer business at New York accounts for their preference for grain. As a matter of fact, the differential by which the freight charge on grain by way of New York is 3 cents higher than by way of Baltimore or other Southern ports was made more than 20 years ago, and entirely independently of any consideration as to the exact cost of transfer facilities at New York. The witness implies that the cost of the transfer is often more than 3 cents per 100 pounds, and says that the Erie Railroad formerly found it necessary to restrict somewhat the options given to shippers as to the numerous points about New York Harbor to which grain could be delivered without special charge. (672, 673.)

Negative.—Mr. BARRY says that the various arguments presented by the railway companies in justification of the differences between the rates on flour and wheat are not warranted by the facts. The railroads can handle flour as cheaply as wheat. Cars can be loaded to the full weight capacity with export flour, since the bags in which the export shipments are always made can be piled up nearly to the roof, especially at the ends of the car. Cars are never more than half filled with wheat, since the greater weight of wheat would break down the running gear. The average weight of flour shipments may be less per car, but this is because the railways have seen fit to furnish largely small, old-fashioned cars for flour shipments.

The argument that wheat can be secured abundantly at the times when it is most needed for transportation is more than offset by the fact that the largest demand for wheat transportation is immediately after harvest, and that the railways are often unable to secure return shipments sufficient to fill the large number

of cars then used. The shipments of flour are quite steady throughout the year and can be counted upon.

The real reason, Mr. Barry thinks, why favoring rates have been made on export wheat shipments rather than on flour shipments is that the railways have been largely interested in elevators and have found it to their interest to secure a foreign market for their product. Moreover, the small number of important wheat exporters and the large business which each controls enables these to a considerable degree to dictate to the railways. He admits that these large firms, of which there are practically only five in Chicago, are often able to furnish full train loads of wheat for shipment, which is more than the millers can do. Mr. Barry believes that some of these large export dealers have discriminating rates lower than those published, and it is possible there may be discriminations between the different large dealers themselves. See on this point p. 79. (241-244, 249.)

Mr. VANLANDINGHAM does not admit the claim of the railways that these differences in charges are justified by the greater cost of handling flour. As much of flour for export is shipped in a car as of wheat. The shipper in each case loads the car, while the railway company usually loads the flour on the steamer, and at some of the Gulf and south Atlantic ports also pays the elevator charges for loading the wheat on the steamer. Flour for domestic use is hauled at the same rate as grain, although cars are not loaded to their full capacity. Mr. Vanlandingham thinks that the real basis for the difference on export shipments is that the railroads can get large quantities of wheat at almost any time when they happen to have empty cars to go East, and that this is not true of flour. There are only about twenty firms engaged in the export grain business, and these often have large stocks on hand. The millers are distributed over a large territory, and there are, perhaps, 5,000 firms. The matter of by-products does not justify higher rates on flour, since the miller in Europe gets better prices for his by-products than the American miller. (204, 205.)

Mr. BACON does not think that the difference between the rates on flour and grain is justifiable. There never was any such difference until very recently, when export rates have been introduced for the first time as regards wheat, but have not been applied to flour. Before this change about equal quantities of American wheat and flour went abroad, but American millers have since been at a disadvantage. (424.)

Even a difference of 2 cents per 100 pounds in favor of grain as compared with milled products, according to Mr. EVANS, is a serious injury to domestic millers, and the witness thinks that it is not justified by any of the arguments presented by the railways. It has not been shown that it costs more to handle flour. There is a considerable loss in quantity in shipping unground wheat. Cars can be loaded as heavily with flour as with grain. The witness has found that 16 cars taken consecutively from the books of his mill have averaged a weight of 63,306 pounds to the car. Numerous railway officers have told the witness personally that they did not approve of the discrimination. Mr. Ingalls, president of the Chesapeake and Ohio and Cleveland, Cincinnati, Chicago and St. Louis railroads, in a letter to the witness, has expressed himself as opposed to the reduction in the wheat rate which caused this discrimination. The discrimination has been in existence only since February 1, 1899, and no new reasons have come into existence since that time for maintaining it. (435-438.)

Mr. SAGER also denies that there is any justification for the difference in rates between grain and flour. Millers can load 60,000 pounds of export flour on a 60,000-pound car, although the custom in the domestic trade has been to put 150 barrels—somewhat less than the total capacity—in a car. The millers load the flour themselves. The witness thinks that the probable explanation of the difference in charges is that certain officers of the railroads are interested in elevators and other terminal facilities for handling wheat. It is for the interest of the railroad stockholders to give the millers favorable rates. The mills become centers of population, and give the railroads business in hauling milling supplies as well as hauling the goods used by the operatives. (449, 450.)

Mr. GALLAGHER says the millers are ready to comply with any reasonable demand of the railroads in respect to the loading of cars, but they claim that the largest and best cars are furnished for shipping wheat and older and smaller cars for shipping flour. If proper equipment is furnished the millers will furnish carloads of flour of any size that the railroads desire. Mr. Gallagher states, however, that when railroads are specially desirous of business they can get train loads of grain more readily than they can get train loads of flour, and this leads to special cuts. (540, 541.)

Mr. GALLAGHER argues that the railroads themselves can not afford to destroy the export business of the American mills because of the large incidental traffic

which mills give the railroads. He estimates the amount of freight, in the shape of coal, lumber, machinery, bags, cooperage, and other supplies for which the mills are responsible, at 88,000 tons more than the annual exports of grain. On a large part of this material the railroads receive high rates of freight. Further, both this traffic and the mill freights of grain and flour come regularly to the railroads throughout the year. (543.)

Mr. NEALL, a shipping merchant of Philadelphia, believes that some higher charge on flour shipments than on grain shipments is justified by the greater ease of handling the grain through elevators, etc. But he has estimated rather carefully that the difference should not exceed 2 or 3 cents per hundred, whereas the actual difference in freight rates has been at times as high as 7½ cents. A difference of 2 or 2½ cents, moreover, is all that the traffic will stand. The by-products of the miller should enable him to pay that much more on his flour. The witness believes that at present competition is keeping the margin between wheat and flour down to about the figure named. (164-166.)

Ocean freight rates on flour and wheat.—Mr. NEALL also points out that a lower ocean freight rate on grain than on flour is justified. It costs about 8 cents per ton to load grain upon a ship and 37½ cents to load flour. A ton of grain will stow in about 50 cubic feet, while 60 to 65 cubic feet is required for flour on account of the use of bags.

Some higher charge upon oats than upon wheat is justifiable in ocean transportation on account of the necessity of tramping down the oats. Flour bears the lowest rate among mill products on account of its condensed weight. (164-166.)

Mr. BARRY does not think that the difference between the ocean freight rates on flour and wheat is any element in the present difficulty regarding export flour shipments. Some difference in ocean transportation is justifiable by the greater cost of handling and carrying flour. The flour shipments are not usually made on through rates to foreign markets, but the rates of ocean transportation vary frequently, and the price of the American product in Europe is changed accordingly. The witness thinks that the ocean steamships seldom have any difficulty in securing full loads of flour promptly. (244, 245, 249, 251.)

Mr. GALLAGHER says that the difference between the ocean rates on grain and flour may sometimes run as high as 5 cents, though if there is no grain available, and flour can be got, the flour may be taken low. As a general thing he thinks the difference would range from 1 to 3 cents. (539.)

E. Milling-in-transit rates.—Mr. BARRY states that the railways usually make it a practice in sections of the country where milling is a prominent industry to haul grain on through rates from West to East, allowing it to be stopped off and milled at any point between by payment of an additional rate of about 2 cents, simply to cover the cost of stopping and unloading and loading the car. Small millers as well as large ones have the advantage of this practice where it exists at all. (243.)

Mr. GALLAGHER states that milling-in-transit rates do not exist generally, but only in certain territories. There are no such rates which are of great value to St. Louis. Wheat can be shipped from western Kansas and stopped for milling anywhere. This wheat, however, is hard wheat and is not suitable for the St. Louis mills, which are almost exclusively soft-wheat mills. The Minneapolis mills profit largely by the milling-in-transit privilege. Their wheat generally comes from the North and the West. One cent per 100 is the general charge for milling in transit. (546.)

Mr. BOOKWALTER states that grain from the West can be stopped at any station on the roads running into Kansas City, such as Topeka, ground, and forwarded, for instance, to New York without any charge above the through rate from the original point. But if the grain is billed to Kansas City, although it is never removed from the car, an additional charge of from 1 cent to 7 cents per 100 is imposed. This places Kansas City at a fatal disadvantage. (571.)

VI. GRAIN ELEVATORS AND GRAIN BUYING.

A. Alleged monopoly of elevator owners.—Mr. CARTER, a commission merchant, states that the railroad people have built large elevators in Chicago, and formerly had them managed by men who were simply managers of the elevators and custodians of other people's property. Now each of these elevators has been turned over to some one large concern, which undoubtedly has the use of it at a merely nominal rent, while any other grain shipper or receiver must pay three-fourths of a cent for having grain handled through the elevator and held 10 days. Mr. Carter does not think that any of the public elevators are now managed by men who are not engaged in the grain business. Efforts have been made to correct

this evil by the action of the board of trade, and also to put greater safeguards by legislation about the handling of public property. Elections in the board of trade have turned upon this issue, and the board has never failed to elect officers who have stood for the handling of public property by disinterested parties. But the efforts to bring about a better condition have not yet succeeded. As a rule, a single operator, to whom the terminal facilities of a road in Chicago have been turned over, controls the grain business along that line of road and does no considerable business on any other line. (583, 584.)

Mr. GREELEY, a commission merchant of Chicago, declares that the original purpose of the public warehouses was that they should be simply custodians of grain for the public. After the interstate-commerce act was passed the railroads, in order to cover up the granting of rebates, saw fit to make arrangements with the owners of public elevators by which favors could be granted in an indirect manner to them and to others, and this led the warehousemen to become dealers in grain. At least 75 per cent of the grain in public elevators sooner or later becomes the property of the warehousemen. The charges to private persons for handling and storing grain are excessive. The transfer charge is three-fourths of a cent per bushel, and the storage charge three-fourths of a cent per bushel for the first 10 days and one-fourth of a cent for each succeeding 10 days. The witness understands that certain transfer elevators connected with Eastern railroad lines receive from railroad companies \$1.50 per car for transferring grain and make a profit, while the charge to shippers is about \$12 per car. The owners of a warehouse avoid this high storage and transfer charge, having to pay only the actual cost, which is much less. The witness thinks that the capital invested by them in the elevators is usually practically nothing, since they are "presented with the elevators by the railroad companies." Owing to these advantages the warehousemen can pay more for grain than others and consequently secure the largest proportion of it. One result of this practice is that the large elevator companies are driving the small country elevators and grain merchants out of business. Sooner or later this process will be completed, and the one buyer will fix the price to the producer. (370-377.)

Mr. DOUSMAN, a grain shipper, says that in earlier days most grain was consigned to Chicago from the West and reshipped there, without through rates. Soon after the interstate-commerce act was passed it became the custom for elevator proprietors at Chicago to become grain buyers in that city and also along the railroads. These elevators arrange to secure through rates on grain from the Mississippi River to New York. Apparently, they are sometimes allowed a certain amount by the railways for transferring the grain in the elevators. As a matter of fact, a large proportion of the elevators in Chicago are now owned or controlled by the railroads, and the witness is inclined to think that the railroads should consider elevator charges as a part of their through rates.

It was also formerly the custom that the elevator owners acted simply as agents, their elevators being public storehouses. But at present the owners of elevators buy most of the grain. The fact that they charge three-fourths of a cent per bushel to those using the elevator, which apparently is more than the actual cost warrants, gives them an advantage over other buyers. The country buyer of grain, who is frequently a merchant, sells to the elevator company; or the company itself often has elevators along the road and buys directly. The witness implies that in many cases there is practically only one such general buyer on a particular line of railroad, although he refers also to the fact that in some cases country grain merchants receive daily offers from 5 to 25 different dealers. He thinks that small concerns can handle grain business more economically than large ones. (354-356.)

Mr. CLARK, secretary of the Grainers' National Association, disapproves of the practice of the elevator owners in buying grain themselves. The Illinois Grainers' Association, which is chiefly made up of commission men and country grain shippers, opposed the enactment of the law permitting public warehousemen to buy grain, as against the best interests of the trade. Most of the public elevators in Chicago are owned by the railroads, although operated by individuals. (434.)

Mr. WEBSTER points out that the act passed by the legislature of Illinois in 1897 permitting public warehousemen to buy grain, was passed after very free discussion in that body and in the press. The vote showed a very large majority in its favor in each house, and an attempt to repeal the law in 1899 was defeated by an even more decisive vote. (409.)

In reply to a question as to the alleged control of the barley trade of the United States by Mr. P. D. Armour, Mr. GREELEY said that although Mr. Armour is a very important factor in the market, other elevators also hold large quantities of

barley. (380.) Mr. Counsellman declares that the claim that Mr. Armour controls the barley trade is ridiculous. The witness himself handles eight or nine million bushels of barley a year. (390.)

B. Interest of railways in elevators.—Mr. BARRY, secretary of the Millers' National Association, thinks that a large proportion of the elevators, not merely in the cities, but along the railway lines, are controlled by railways or their officers. These elevators doubtless have a considerable effect in controlling the prices of grain to the farmers. Millers are not especially injured by them, since the small millers buy grain largely at the mill from the farmers, and the large mills usually have elevators of their own. (350.)

Mr. BOOKWALTER says that eight railroad systems control the grain-producing territory, and every one of these systems is going into the grain business as fast as it can. When the business has been brought into the hands of eight roads, with storage capacity enough to take care of the crop, the local dealer will have to go out of business entirely, unless some remedy can be found. Mr. Bookwalter can not say that the grain is dealt in directly by the railroads, but certain persons can handle it on these roads when nobody else can. He thinks we are rapidly approaching the condition in which a trust will absolutely control the handling, and thereby the price, of grain. He would require the railroads to attend strictly to the railroad business and go out of the grain business and any other; that is the only remedy. (576.)

Mr. GALLAGHER does not consider that companies chartered to operate railroads should be allowed to engage in the grain business. He believes that ownership of elevators by railroads inevitably results in the control of the grain business by the railroads, in the destruction of all competition, and in the establishment of a monopoly. Wherever the road controls the business one finds little elevators abandoned and run down. This shows the destruction of competition. Where competition disappears the price of grain to the farmer is certain to go down. (545.)

Mr. BOOKWALTER states that the Union Pacific has an elevator in Kansas City. The Burlington has none at present, but it is understood that it is going to build one. Mr. Counsellman, who operates on the Rock Island, and Mr. Richardson, who operates on the Santa Fe, have elevators in Kansas City. The Peavey Elevator Company of Minneapolis operates on the Union Pacific, west of Kansas City, and is building a line of elevators. It tries, first, to buy out the local man at a station, if he will sell; if not, it builds an elevator beside him. There are two public elevators in Kansas City, with a capacity of 400,000 to 1,000,000 bushels. The total elevator capacity in Kansas City is about 6,000,000. The understanding is that the elevators are owned by the railroads, though they are operated by private parties. Mr. Bookwalter does not think that the railroads ought to be permitted to go into the grain business or any other business. (573-575.)

Mr. SNYDER says that his firm leases elevators along the line of the railways, and has one leased in Chicago. (397.)

Mr. WEBSTER says that Armour & Co. own practically no elevators along the lines of the railways, although they own all of those which they operate in Chicago except three, which are leased at a high rental. Mr. Armour is interested in various railroads, but receives no advantages from them in transportation rates or otherwise. (443, 446.)

C. Freight discriminations and allowances in favor of elevators.—Mr. VANLANDINGHAM, commissioner of the St. Louis Traffic Bureau, says that on each of the leading railways from grain-producing sections to Chicago, allowances, ranging from one-half to 1½ cents per bushel, are made on grain to one or two favored firms having a large number of local grain elevators, nominally as compensation for gathering the grain, loading it, and shipping it at times when the railways can most conveniently care for it. The favored elevators are thus enabled to pay higher prices for grain. The average profit in handling grain is less than 1½ cents per bushel, and smaller buyers can thus easily be driven out of business. Mr. Counsellman, who controls one such system of elevators, testified before the Interstate Commerce Commission that his warehouses were paying three-fourths of a cent per bushel more than the market prices for August corn at the Mississippi River, being able to make a profit by so doing. The small shipper being driven out of business the large dealer is in a position to depress the price of grain to the producer, although the witness thinks that the prices can not be lowered much below the amount of this allowance without calling in new buyers or enabling the farmer to ship directly.

Many of these systems of elevators, especially those at terminal points, are owned by railways themselves, or by their officers, but the allowances are just as

likely to be granted to distinct companies. The practice described does not, Mr. Vanlandingham thinks, prevail at St. Louis or upon the railroads reaching that city, but he believes that it is general on the Chicago railroads. (198-200.)

Mr. GREELEY is inclined to think that every one of these public warehousemen in Chicago receives special freight rates and considerations, and that they are also notified in advance of changes to be made in rates, so getting an advantage over their competitors.

Mr. Greeley says further that the Eastern railroads have arranged with certain favored elevator men to transfer grain from Western cars to Eastern cars, putting the transfer houses owned by the railroad in the charge of these favored individuals. These persons are themselves grain dealers and competitors of the men whose products they handle, which gives them an unjust advantage. (370, 377.)

Mr. DOUSMAN declares that one of the chief reasons why the elevator business has been largely centralized in a few companies is the discriminations in their favor by the railroads. In one instance brought before the Interstate Commerce Commission by the Chicago Board of Trade in 1890, it was shown that regular buyers of grain along Western railroads had found themselves forced to sell to certain individuals, and this was due to the receipt of a rebate of 5 cents per 100 by these favored individuals. The matter was not pushed to a final decision, because Mr. Counselman, the head of the elevator system on the Rock Island Railroad, declared that he could not testify without incriminating himself. (354-356.)

Mr. BOOKWALTER believes that the large elevators get favors from the railroads which enable them to pay more for grain than others can pay, and to drive others out of business. For instance, two days before his testimony there was bid for No. 3 corn, Chicago terms, on track at Humboldt, 120 miles from Kansas City, 25½ cents. The rate to Chicago is 17¼ cents, or 9.8 cents a bushel; that would make the corn cost 35.3 cents at Chicago, if the tariff rate were paid. The best corn was worth that day in Chicago 33¼ cents. The Peavey Elevator Company, of Minneapolis, which is getting control of the grain business on the Union Pacific west of Kansas City, offered one-fourth of a cent more for corn along the Union Pacific road a few days before Mr. Bookwalter's testimony than the Kansas City price on the same day, less the freight to Kansas City. Again, in testimony before the Interstate Commerce Commission a year or two ago, it was stated by an elevator man that the railroad company paid him as much as 4 cents per 100 for running grain through the house, as an elevator charge. This was really a drawback on the freight and would give him the absolute control of the business on that road. (574-577.)

Mr. CARTER has no doubt that the large dealers in grain who control the business along several roads centering in Chicago have lower freight rates than the ordinary buyer. He believes that one reason why the roads would wish to concentrate business in the hands of one man is that rebates can be paid to one and kept secret; if they were paid to a dozen, the secret could not be kept. He instances a man who has done business with a line of road for not more than a year, and so has not had opportunity to become established and make friends there, and yet is getting perhaps nine-tenths of the grain that comes in over that road. He had done a grain business of a general character in years past, and had shown no great ability. He does not now do any considerable business except on the one line which he has a connection with. If his very large business there were due to his great skill this would have shown itself in former years and would now show itself in other districts. This particular man is not interested, Mr. Carter thinks, in the road which he is connected with; but he suggests that an arrangement could easily be made by which half a dozen silent partners could enjoy the profits. (583, 584.)

Mr. BACON, of the Milwaukee Board of Trade, thinks that the great elevator owners undoubtedly receive advantages from the railways. As evidence he submits an instance in connection with the Milwaukee Elevator Company, which is understood to be controlled largely by P. D. Armour. Postal cards sent out by this company to Kinbrae, Minn., and Flandreau, S. Dak., offered prices for wheat at Milwaukee ranging, if full freight rates were paid by the buyer, from 0.95 cent to 2¼ cents more than the price of wheat at Milwaukee on the particular day. Similarly, the price offered for oats, freight rates counted, would make the cost at Milwaukee from one-sixth to nearly one-half cent more than the price at Milwaukee, oats always being handled on a small margin. The inference is that the buyer must receive some advantage in freight rates. Mr. Armour is also a director in the Chicago, Milwaukee and St. Paul Railway, which extends from the points named to Milwaukee. The ownership of elevators by the buyer can not explain

this difference in price. Elevators are lately used but little for storing grain, and, moreover, the proprietors would have as much advantage from buying grain at Milwaukee at market rates and storing it in their own elevators as in buying it at other points.

Such discriminating rates are usually made wherever there is competition, whether it be between different marketing points or simply between different railroads.

Generally speaking discriminations are still frequent, although they are confined to a smaller number of beneficiaries than formerly. The witness has heard of instances where rebates have been paid by railway officials in currency and without any receipts. Some grain shippers secure advantages by paying what are known as proportional rates on shipments to Chicago or Milwaukee with the understanding that the grain is to be forwarded for export purposes. There is nothing to compel the grain actually to be forwarded, and an advantage is obtained in this way. There is, in fact, a general impression that elevator owners at Chicago and Milwaukee receive advantages.

The St. Paul road owns all the elevators at its Milwaukee terminals, but leases most of them to the Milwaukee Elevator Company and one to F. Kraus & Co. (427-429.)

Mr. GALLAGHER does not think that low freight rates on grain, made in the manner in which the roads actually make them, are of any benefit to the farmer. The reason is, however, that the low export rates are obtained only by particular persons. If everybody had the low rate it would be better for the farmer. He gives an instance of a large mill which contracted with the railroads to ship 17,000 bags of flour, 400 to a car, at a rate of 5 cents. "They slapped in one of these midnight tariffs, published the tariff, and gave notice of withdrawal just as quick as he filled the contract." (543, 544.)

Mr. Gallagher admits that the price of grain to the farmer may occasionally be raised by means of cuts in freight rates, when there are competing lines of railroad and also competition in the buying of grain on that account. (541.)

D. General explanation of business by elevator owners.—The witnesses representing the great elevator companies reply generally to the complaints against them by explaining the reasons why the warehousemen have become grain buyers, the causes of their success, and the sources of complaints.

Mr. WEBSTER, president of the Armour Elevator Company, says that about the middle of the century Chicago, St. Louis, and Milwaukee became the primary markets for the rapidly developing grain production of the Western and Northwestern States. These Western States have increased their production until 10 of them produce from 55 to 67 per cent of the grain crops of the country. But meantime the development of railroads, of lake transportation, of local mills, and of other cities has diverted much of the grain trade from Chicago, as is shown by the statistics of the receipts at that point as compared with the total production. Minneapolis, through its flour mills, has become the greatest primary wheat market in the world, although it does not handle as much grain, aside from that turned into flour, as Chicago. Duluth is second to Minneapolis. Chicago comes next, while the wheat receipts of Kansas City are almost equal to those of Chicago. There are a great many other widely separated markets on the Great Lakes and elsewhere. Grain no longer seeks a market at Chicago; Chicago markets must seek the grain.

Immense elevators had been built to accommodate the great quantities of grain which formerly sought Chicago. Owing to the changes just mentioned much of this elevator space would have become idle if the proprietors had not determined to buy grain themselves and thus bring it to Chicago for handling and storage. They were able to do this to better advantage than commission merchants for various reasons. The value of the grain could be increased by cleaning. The proprietors could include the storage charges in the cost to them of the grain, especially since they were enabled to use space which otherwise would have remained idle. By doing business on a large scale, including storage, filling of orders, and shipping of cargoes, the elevator owners could afford to pay higher prices to farmers than commission men. Moreover, the elevator men sell largely for export trade and have facilities for choosing the best markets and securing the most favorable ocean rates. In fact, their advantage over the small dealer is simply that which comes legitimately to any person in any line of business who supplies himself directly with needed appliances, raw materials, etc., avoiding the payment of profits to other persons.

Mr. WEBSTER declares that he knows of no discriminations in freight rates in favor of elevator owners. The published rate obtains in all cases. There is a discrimination in favor of points on and west of the Mississippi River from the

fact that grain can be shipped to the seaboard on through bills of lading at less than the sum of the local rates from the point to Chicago and from Chicago to the seaboard, an arrangement which is not made as regards points between the Mississippi River and Chicago. (415.)

It is true that many of the public elevators have found it to their advantage to become private elevators, especially because the use of machinery for cleaning grain is prohibited in public elevators; but the use of such machinery is advantageous to the producer, as was shown after an exhaustive judicial investigation as to a similar practice in Kansas City. Notwithstanding the advantages of private elevators, there are, according to a detailed list of warehouses submitted by the witness, public elevators in Chicago having a capacity of 28,600,000 bushels, the private elevators having almost exactly the same capacity. The legislature of Illinois, in accordance with the constitution of 1870, has passed laws regulating public warehouses, especially such as mix grain together so that that owned by different persons can not be distinguished. Licenses must be obtained and bonds given, while the grain is carefully inspected. The public elevators of Chicago handle about 25 per cent of the grain received at that city.

It is doubtless true that the commission merchants who formerly handled the grain passing through Chicago have found their business taken away largely by the purchase of grain by elevators, and they naturally feel bitter. But the system is much more economical and advantageous to the grain producer than that which formerly existed. Besides, the competition of other cities would have taken away the business of these merchants in any case. Moreover, they can move elsewhere to carry on business, and the elevators can not be moved. The purchase of grain by elevators has also, Mr. Webster thinks, become the common practice at other grain cities besides Chicago. (400-411.)

Mr. COUNSELLMAN, a grain-shipping merchant of Chicago, declares that the practice of the elevators in buying grain is a matter of recent growth. Formerly the railroads had a local rate on grain from the West to Chicago and another local rate to Eastern points from Chicago. Commission merchants then handled grain on commission and stored it in the public elevators, and the elevator owners felt no necessity for buying grain. The railroads then introduced a through rate from Western points to the seaboard less than the sum of the two local rates. The Eastern grain buyer could therefore afford to go into the Western region and buy grain, paying more for it than could be paid if it were brought to Chicago on the local rate and afterwards shipped from there. So, too, the grain buyers in Minneapolis and the Northwestern points were able to pay more for grain in northern Iowa and adjacent regions, shipping it by water from Duluth. The elevator companies at Chicago were accordingly forced to buy grain to protect their own interests and to keep Chicago in the front as a grain market. The commission merchants who were unable to compete with the large elevator concerns have been those who complained concerning the elevators. The elevator companies mostly take advantage of this lower through rate, which is made through Chicago itself. This through rate is open to all persons, and the grain buyer has the privilege of shipping grain out from Chicago by lake or by rail or of stopping it there, paying the local rates. (382, 383.) Mr. BARTLETT confirms this testimony generally. (393.)

Mr. Counselman suggests that this discrimination in favor of through rates is injurious and should be abolished. (392.)

Mr. WEBSTER, of the Armour Elevator Company, also refers to this through rate as injurious, especially to intermediate points between the Great Lakes and the Missouri River, which have to pay the local rate. It is probably a factor in causing the elevators to buy grain. (416.)

Mr. COUNSELLMAN admits that the great elevator companies have an advantage over smaller commission merchants and grain dealers in handling grain. The charge of three-fourths of a cent per bushel for handling grain is not excessive. The State law of Illinois permits 1½ cents to be charged, and this is the rate prevailing at Minneapolis, Duluth, New York, and Boston. The charge includes the transfer of grain from the cars and storage for 10 days. Nevertheless, the owner of the elevator naturally has an advantage because of his possession of these facilities, and it is impossible by any fair method to put the small dealer, who has less capital and less satisfactory facilities, on a par. The cleaning of grain by warehousemen, raising its grade, is also a source of profit. The elevator man on account of his advantages can pay the most for grain, and accordingly gets the grain. The small dealer must accumulate 5,000 bushels before he can sell his grain in the speculative market, and during the process would have to pay storage on the grain in the elevator and lose interest and insurance charges. Accordingly the small dealer mostly sells grain on the track and does not put it in

elevators. Moreover, the large business and the opportunity for storage of the elevator proprietor enable him to sell in the best foreign market and at the most favorable times. There is nothing to prevent any person from building elevators who has the capital. The elevator companies have no exclusive arrangements with railroads, nor do the railroads themselves usually own any elevators. Mr. Counsellman declares that he owns and has paid for with his own money the elevators along the Rock Island Railroad. The railroads do not care to go into the grain business and it is not permitted by their charters. They could not compete with the great elevator men, who sell grain in the markets over the entire world.

The complaints concerning the existence of private elevators as distinguished from public elevators are entirely unwarranted. In fact, speculators frequently urge that there should be fewer public elevators in order that less grain might be kept in stock, and that speculation might be freer accordingly. The witness owns public elevators, and they are open for use, but he does not care to do that kind of business especially. The total capacity of the public elevators of Chicago is at least 23,000,000 bushels, and that of the private elevators probably not much over 10,000,000 bushels. (385-389.) (As to these figures, compare Mr. Webster's statement, p. 82, above.)

E. Effect of grain buying by elevators on prices to farmers.—Mr. SAGER refers to the practice of a few large buyers and elevators in meeting daily on the Chicago Board of Trade to fix the price of grain for certain sections of the country. He does not altogether know the motive, but presumes that they intend to keep from competing with one another and paying too high prices. Although they are not the exclusive buyers in these sections, they are much more generally represented there than any other buyers, and they get most of the grain. (451.)

Other witnesses, as seen under Section A, also think that for the most part the business of grain buying on each railroad system is confined to one concern, and that this must ultimately have a depressing effect on prices to farmers.

Mr. CARTER thinks it certain that unrestricted competition gives the best results for the producer. In the end the farmer will not be benefited by the operation of the large institutions which are monopolizing the grain business. When there is only one concern to buy grain along a given road, a condition of affairs which is probable, the farmers will not get a better price for their grain. (546.)

Mr. COUNSELLMAN declares emphatically that there is no combination between the elevators in Chicago or along the different railroad lines, and that the price to farmers is not fixed by any agreement. The railroads, in fact, will not permit the exclusive ownership of elevators at any one point along their lines. The small grain dealer receives offers from a score of sources every morning for his grain on the track. Moreover, the railroads will furnish cars and the farmer can ship his grain himself, and sell it on the track in Chicago without putting it in elevators or paying elevator charges at all. (384.)

Mr. BARTLETT also declares that there is no agreement whatever between his firm and any other firm or elevator company. His firm buys a considerable amount of grain on the Rock Island road, where the elevators are chiefly controlled by Mr. Counsellman. Mr. Bartlett controls no elevators on that road, but buys directly from local grain dealers, who still handle the great bulk of the grain. It is true that the prices paid by different elevator men at the same points are usually the same, or nearly so, but this is necessary, because they all operate under similar conditions and sell their grain in the same markets. They would have no object in overbidding one another in buying grain. (393, 394.)

It is true, Mr. COUNSELLMAN admits, that four or five men who deal on the board of trade meet daily and discuss the price which shall be paid for grain along certain lines of railroad. This is done, Mr. Counsellman declares, because of the competition of other markets with the Chicago market. These dealers are determined to pay the farmer as much for his grain as those in any other city, and are simply fighting for the Chicago market. (387.)

Mr. BARTLETT also refers to the daily agreement between certain large elevator men as to the price of grain in the territory west of the Missouri River. This, he declares, is made in order to meet the competition of buyers who ship grain from that region by way of the southern Atlantic ports or of the Gulf ports. It is necessary in order to protect Chicago as a grain market. Chicago dealers are practically unable to buy grain in Kansas at all on account of the competition of the Gulf and the lower freight rates in that direction. At certain seasons of the year, however, corn can not be sent by way of the Gulf for fear of its germination. (394, 395.)

Mr. Webster makes a similar explanation as to the agreements concerning prices. (416.)

Mr. COUNSELMAN further says that it is true that he and other grain dealers sometimes pay more for grain from Nebraska, at a greater distance, than from Iowa. This is largely due to the superior quality of grain from Kansas and Nebraska, caused by the dryer climate. But the fact that the railroads make their rates for the longer distance little greater than for the shorter distance also accounts for this practice. In part, this adjustment of rates, the witness implies, is unjust. (392.)

Mr. Counselman says that the practice of the great elevator companies in buying and holding grain is advantageous to the producers, not only from the fact that commissions are saved, but from the fact that temporary surpluses are carried by the buyers until needed. The large elevator companies especially deal in grain for European consumption. There are many times when there is no demand for American grain in Europe, and the buyers must carry it until consumption overtakes supply. Thus, Argentina during the fall of the year supplies the European demand largely. There being no elevators or speculative system, grain from that country is all dumped on the market in a short time, and afterwards the American grain can be sold at a fair price. (384.)

Mr. BARTLETT also refers to the fact that elevator men hold grain until needed for European markets, and that at certain seasons Argentina practically controls those markets. (393, 395.)

Mr. BARTLETT says, further, that 25 years ago practically all grain paid a profit to the local grain dealer and a commission at Chicago to the commission merchant there, and another commission at the eastern seaboard to the merchant who sold it to the exporter. Certain Eastern firms then began to buy grain directly from the local Western elevator man or dealer, leaving out the Chicago commission merchants. The grain dealers in Chicago were finally forced to adopt a similar system, and now Mr. Counselman, the firm in which the witness is interested, and others, have in many instances become the only middlemen between the farmer and the foreign consumer. They operate country elevators and buy the grain directly, selling it abroad or wherever the market is most favorable. The elimination of these numerous commissions is a benefit to the producers. (393.)

Mr. SNYDACKER agrees with the testimony of Mr. Bartlett. He declares that the present method of handling grain is a survival of the fittest. The old system of handling on commission gradually dwindled. The smaller the number of men who must be supported by the handling of grain between the producer and the consumer the greater the advantage to both producer and consumer. Fifteen years ago the commission merchant at Chicago got a commission of 1 or 1½ cents per bushel on wheat, and there were several other commissions or profits at different points on the same grain. Now an elevator company is content with a profit of 1 cent per bushel between the producer and the consumer in Europe. (396.)

Mr. WEBSTER, president of the Armour Elevator Company, states the effect of the purchase of grain by elevators upon the prices received by the producer in very much the same terms as Mr. Bartlett. He adds that in earlier years farmers were practically forced to sell their grain to one local dealer. There were few towns and few elevators and the local dealers expected a profit of from 3 to 8 cents per bushel. Many new towns have grown up, competing with one another, while at nearly every town there are from two to six grain buyers. The witness thinks that the average profit of country grain buyers now is from 2½ to 3 cents per bushel. Formerly these grain buyers consigned grain to Chicago commission merchants. These sold it to other commission merchants in the East, representing Eastern buyers. The Eastern buyer, whether he exported the grain or sold it to Eastern mills, expected a liberal profit. All of these profits and commissions have been greatly reduced by the practice of the elevators of buying grain. Since the ultimate market price is fixed abroad by the competition of the entire world, any reduction in intermediate charges necessarily comes to the benefit of the producer. In fact, the wholesale grain buyer, who is also an elevator proprietor, now often pays the farmer more than the current Chicago prices would seem to warrant. He is forced to do this to meet the competition of other marketing points, and he counts on making up the difference by doing business on a very large scale. In fact, he must be a buyer over a very large extent of territory in order to get enough grain to keep his elevators busy. He is able to offer higher prices especially because he exports much of what he buys and has special advantages in selecting his foreign markets and securing the cheapest market rates. Moreover, the elevator man often buys grain with a speculative purpose, expecting to store it for some length of time in anticipation of a higher price. Being the owner of the elevator, he may at times cut into the allowance for elevator charges, since the actual cost of handling may be somewhat less than the charge

to outside dealers storing grain. The witness refers by way of illustration to similar economies which have been made by carrying on the packing and provision business on a large scale. (405-410.)

Mr. BOOKWALTER states that though he has not been in the grain business 10 years, he has seen the customary margin decrease from a cent a bushel on wheat and half a cent on corn and oats to half a cent on wheat and a one-fourth of a cent on corn. (574.)

Mr. BURKE, a grain dealer of Friend, Nebr., thinks that the present method by which the great elevator owners in Chicago and elsewhere buy grain directly from the country dealers is very beneficial to the farmers and satisfactory to such dealers. Several years ago the dealers found it necessary to calculate on about a 5-cent margin on every bushel of grain, in order to protect themselves against variations in the market before the time when they should succeed in actually delivering or selling it. Now the dealers receive bids every morning for the grain on hand and can sell it immediately without taking any risk whatever. The result is that they are satisfied with a profit of from 2 to 3 cents per bushel on wheat and from one-half to 1 cent per bushel on corn, and the farmer gets the advantage accordingly. Moreover, the farmers themselves can get the same shipping facilities as the local grain dealers, and can ship directly to the large grain centers, as, in fact, they quite often do.

The witness sometimes still ships grain to the central markets. He is not sure whether he could get the same freight rates as the great elevator owners, but presumes he could. When grain is shipped in this way, a commission must be paid to a merchant at the central market, which is avoided by selling directly.

The witness does not think that any group of elevator men control the market in Nebraska. He gets bids for grain from Armour & Co. and other large Chicago dealers, though it is possible that they do not compete strongly against one another. But bids are received daily from St. Louis, Kansas City, and often from Galveston, St. Joseph, and other points. These differ frequently by one-fourth or one-half of a cent, and there seems to be no collusion between buyers at the different markets. During the year 1899 little grain has gone from Friend to Chicago, most being sent to Kansas City, where the prices are somewhat better. (465-467.)

Mr. HULBERT, a grain dealer of Fontanelle, Iowa, says that the margin of local grain dealers in handling corn is now about 1 cent or 14 cents, as compared with 3 cents or 4 cents 7 or 8 years ago. The difference is partly explained by the fact that corn was formerly bought with snow and other impurities and had to be cleaned, and was also usually shelled by the buyer. At present corn is shelled and cleaned to a considerable extent by the farmers. At the same time the witness thinks that the recent practice of the local dealers in selling their purchases directly to large elevator owners and dealers at Chicago, instead of sending it for sale on commission, has been beneficial to the farmers in securing higher prices. The witness has often shipped grain to Chicago and sold it there, but thinks that he can now always get a price a cent or more higher by selling it on the track in Iowa. The witness thinks that probably these large dealers have some advantages in freight rates, which explains the fact that they are able to pay more for grain than, if the full freight rate were paid, could be received at the market price in Chicago. At the same time they have many advantages in handling grain. They have the necessary machinery for cleaning wheat and improving its grade, as well as for handling it generally.

The witness knows nothing about any agreement for fixing the prices between these different purchasers. Bids are usually received from several different purchasers at Chicago, and also from other markets, and the witness does not believe that any agreement among the Chicago buyers would affect the business from the other cities. Corn is largely sold at St. Louis, Peoria, and even Louisville. The witness supposes that buyers at Louisville have in view seaboard inspection and weights, and that they haul corn over lines which give them better rates than Iowa shippers can get themselves.

Mr. Hulbert thinks that the farmers of Iowa have no special grievances against transportation companies, although it is often difficult for those who wish to ship grain directly to get cars promptly. Moreover, the shipper is required to load his car within 48 hours, which is often a difficult thing for a farmer to do. (486-489.)

Mr. FULLER, of Norfolk, Nebr., says that at that town there are two competing grain dealers, although, perhaps, they do not compete very strongly against one another. The feeding of stock furnishes a strong competitive market for grain, especially for corn. The witness does not know of any special complaints on this subject. (445.)

F. Effect on speculative prices.—Mr. GREELEY declares that the hoarding of large stocks of grain in the public elevators of Chicago gives an advantage to the bear speculators, favoring the short sellers at the expense of the buyers and tending to

depress the price of grain generally. The warehousemen desire to hold the grain as long as possible in order to earn the carrying charge paid by speculative owners. Consequently, if a condition of the market can be produced which will force a man who has bought grain for future delivery to sell it out ahead for another deferred delivery the warehouseman will gain. The bear speculators or short sellers, with this immense quantity of grain in sight, can count on getting grain to fill their contracts at the last moment, while the buyer is frightened by the immense stock on hand. The bear speculator in the meantime uses all his efforts to depress the markets. The fact that the warehousemen deal and speculate in grain, and that they do not have to pay storage rates, gives them an advantage in forcing men who buy for future delivery to sell out at a lower price.

The existence of this large supply of grain also promotes the bucket-shop business. The bucket-shop proprietors are mostly short sellers, who are enabled to count on fulfilling their contracts if necessary. It has been estimated that there are about 10,000 bucket-shops in the United States, and they trade in 30,000,000 bushels of grain per day. The result of this bucket-shop speculation, and of the similar though less extensive abuses under the Board of Trade, is a tendency greatly to depress the price of grain. The witness attributes the lower prices which have prevailed for the last 10 years largely to this influence, and thinks that the panic of 1893 and the political discontent of the Western States during recent years are explainable by the same cause. Often speculation depreciates the value of a new crop long before it exists. The witness thinks that the ultimate remedy for this evil, which has its origin in railroad discriminations in favor of public warehouses, must be Government ownership of railroads. (371-378.)

Mr. Greeley says, further, that so far as public warehousemen are buyers of grain it is to their advantage to depress the price to the farmer, since the insurance and interest on the investment are thus made less. (380.)

The claim that it is to the interest of the elevator owners to keep down the price of wheat is characterized by Mr. COUNSELMAN as ridiculous. The witness says that he does not speculate in grain. He buys it and sells it as soon as possible, either in Chicago or in Eastern markets or in Europe. Very little grain is held in his elevators for any length of time. It is true that a considerable amount of grain is constantly at Chicago, but this is necessary to prevent frequent corners on the market. (386.)

Mr. WEBSTER declares that it is entirely impossible for elevator owners or large grain dealers to manipulate the market, just as it has always proved impossible for any speculator or group of speculators to control prices. If the elevators tried to force up prices the immense amount of grain coming from all parts of the country would make this impossible, while to attempt to force down prices makes the market the target of buyers from all over the world. With the world market for grain supplied from Argentina, Russia, and many other different sources, the natural laws of supply and demand are more inexorable in the grain business than in almost any other. The elevators, therefore, are not responsible for bucket shops or bear raids. Armour & Co. have never been short on the grain market. It has been their policy to prevent depression of prices if possible. (410-413.)

G. Alleged discriminations by elevators as to quality of grain.—Mr. CARTER states that the fact that while the elevators are still used as public storehouses, the larger part of the grain in them belongs to the managers of them, gives a great opportunity for illegitimate profit. Out of 100 cars of grain inspected as of one grade, 8 or 10 cars may vary 1 cent or 5 or 6 cents in value from others. If all were simply put together into one bin the purchaser would get a fair average of the grade. Under the old system many grain dealers bought elevator receipts. To-day a careful man would not accept simply the inspection and receipt, but would want to see a sample of the grain itself. Otherwise he is likely to be compelled to take the very lowest quality that can be brought into the given grade. (582, 583.)

Mr. Greeley also says the public warehousemen mix different qualities of grain or sort them out in different ways. A shipper who buys grain from public warehouses will be furnished with a relatively inferior quality, while the warehouseman can offer for sale the slightly better grades, thus securing practically a monopoly of the selling business in Eastern markets. The owner of grain is supposed to be able to keep it in elevators in a special bin by itself, but as a matter of fact he can not get this privilege, and it seems almost impossible to get even general storage. The courts held some time ago that public warehousemen were not entitled to deal in grain, but the warehousemen secured an act of the State legislature, by corrupt means, as the witness believes, giving them specifically this power. (370-377.)

Mr. SAGER, secretary of the Northern Milling Company, of Chicago, declares that the practice of public warehousemen in buying and owning grain is injurious to the millers. There is a constant temptation for the warehouseman to give the lowest quality of grain which will meet the standard grade to the miller who buys grain on the exchange, while retaining for his own private sales or for the benefit of dealers associated with him the better qualities. The millers have found by experience that the warehousemen make these discriminations, and they now never accept wheat simply on State inspection, but hire private inspectors to see that they do not get the bottom of the grade. Because of these possibilities he thinks that it is improper to permit owners of public elevators to be dealers in wheat and to mix their own grain with that held for storage. The Chicago millers are compelled to buy large quantities of grain from the elevators. The witness has found that it is often impossible to buy grain from Western points and ship it to Chicago in competition with the great elevator owners and grain dealers, and he thinks that this is due largely to railroad discriminations made in favor of such persons. More than three-quarters of the grain used by the Northern Milling Company is bought in Chicago, and the proportion which must be so bought has been rapidly increasing. Even when grain is bought from a commission firm, that firm is often allied closely with some elevator owner. The capacity of the Chicago mills, when running constantly, is about 7,000,000 bushels. (450-452.)

Mr. WEBSTER says that it would be absurd to expect elevator proprietors, who may clean grain or store it simply, to furnish to the public better grain than the inspection department requires to meet the official grades. On the other hand, the witness declares that the most exhaustive investigation has failed to show a single instance in which a Chicago elevator proprietor has mixed or handled grain in his public elevator so as to give an advantage to himself. (411, 413.)

Mr. VANLANDINGHAM says that there are various public grain warehouses at Chicago and other terminal points which are for the most part controlled by the same persons who control the private warehouses. He does not think that the farmers, or even the shippers, are injured by the possible mixing of grain of different grades at these elevators, although it is true that grain once shipped there loses its identity. As a matter of fact, the grain is paid for in the first instance, not simply according to its general grade, but according to its special quality. There are in very large markets professional grain mixers who buy grain of different qualities, being willing to pay more than the average grade price for superior grain. These mixers then combine different grades, possibly sometimes to the injury of the buyer, but scarcely to the injury of anyone else. (200, 201.)

H. Grain inspection.—Mr. CLARK, secretary of the Grainers' National Association, says that the grading of grain has not been reduced to an exact science. Flaxseed inspection has been made very systematic, but the attempt to devise similar methods as to other grains has failed. Inspectors are not always in the same mood, and their judgment differs greatly. The millers frequently grade grain very differently from the official inspection departments, taking into account many characteristics of which the inspectors know nothing, such as the strength of the grain in gluten or in starch. The grading of barley by official inspectors at Chicago has been for years disregarded by the trade, the outward characteristics of barley being especially deceptive as to its value. The witness mentions one instance where a dealer paid $4\frac{1}{2}$ cents more per bushel for a certain grade of oats than the ruling market price for that official grade.

The inspection methods of different cities differ materially. The rules of each market are made chiefly with a view to the general character of the grain coming from the region tributary to that market. Thus St. Louis gets certain qualities of grain which seldom come to Chicago, and vice versa. There is a growing approach toward uniformity in the rules of the different markets, but they are carried out with different degrees of accuracy. Peoria is the only market of importance west of Chicago that has a private inspection system. In most Eastern markets the inspection is not governed by State laws. The witness implies that public inspection is usually more satisfactory than private; but he disapproves the proposed national system of inspection as being impracticable. It has been suggested that national inspectors at Washington and their deputies in different sections of the country should make chemical analysis of any grain submitted to them. The different markets if left to themselves will work out a classification essentially uniform and to the best interests of the grain producers. In order to bring grain to the market each city will wish to make its rules as favorable as that of any other. (431-434.)

Mr. EVANS, a miller of Indianapolis, declares that persons handling grain throughout the entire country are interested in the inspection system at Chicago. He has found from experience that the inspection is often dishonestly rigid as

regards grain coming into the city and dishonestly lax as regards that going out. He refers to specific instances in which grain shipped to Chicago has been reduced in grade and grain from Chicago found inferior to the grade fixed. He thinks that State inspection is apt to be irregular in quality, owing to political influences in appointments. The witness thinks, however, that national inspection is impracticable, on the whole. (440.)

Mr. DORSMAN thinks that the temptations to grade grain unfairly under the existing system of inspection are undoubtedly great. The inspectors in Chicago are fairly well experienced and doubtless have the ability to grade grain rightly if they perform their duties faithfully. (356.)

I. Grain markets and prices (see also pp. 74, 81).—Mr. BOOKWALTER states that since 1895, when there was a shortage in the corn crop and 100,000,000 bushels of wheat was fed to stock, wiping out the immense visible supply, Chicago rather than Liverpool has controlled the price of wheat. It is true that it is often said that low cables from Liverpool put down the price in Chicago and high cables put it up; but Mr. Bookwalter thinks such statements are made chiefly to influence the speculative markets. The foreign cable of to-day is based on our market of yesterday. This is because the Liverpool market of a given date comes earlier; it closes very soon after the Chicago market begins. The influence of the markets of Chicago and Liverpool is mutual, but that of Chicago is the greater. (576, 577.)

Mr. GALLAGHER also thinks that the Chicago market exercises the principal influence upon the price of grain. The foreign markets control, of course, just so far as they are buyers. If there is a good demand in Liverpool, the foreign market is likely to influence our markets for the time being. St. Louis buys much more wheat than Chicago, on account of its large milling interests. (544.)

Mr. BOOKWALTER states that Kansas City is a higher market for grain than any other in the country, simply because it gets so little. The receipts of oats are only 4, 5, or 6 cars a day—merely what is consumed there. The wheat the city received last year was about 30,000,000 bushels from a territory that raised 240,000,000 bushels. Mr. Bookwalter recently made some investigation on the amount of grain shipped from various stations to Kansas City and to other markets. From Homan, a small station on the Rock Island, a shipper sent about 400 cars; 54 came to Kansas City; 227 stopped at a mill on the way to Kansas City. From Table Rock, 272 cars of corn were shipped; only 3 to Kansas City. "These were not shipped by dealers; they were shipped by farmers, who did not know any better." In 90 days preceding Mr. Bookwalter's testimony, 3 cars of corn a day, on the average, had been received at Kansas City from the Burlington system. He thinks the receipts ought to have been 150 cars. (572, 574.) Compare Mr. Webster's statement that Kansas City stands close to Chicago as a grain market (p. 81).

Mr. Bookwalter states that, out of 500 cars, three days' receipts at Kansas City, less than 2 per cent was what is known as graded wheat; it ran from "rejected" to "4" and "3." This inferior wheat is sent to Kansas City, because that is the nearest market and the wheat is not, as a rule, in a condition for long shipment; it is desirable to get it out of the car as soon as possible. Kansas City is the nearest place where it can be put into an elevator, scoured, dried, and stored. (572.)

Mr. GALLAGHER says that whenever the world has an overproduction it affects the price of wheat disastrously for the time being, but that overproduction can not have a depressing influence for any great length of time. (543, 544.)

VII. RAILWAY POOLS, ASSOCIATIONS, AND AGREEMENTS.

A. Forms and methods of pools.—(See also *Effect on discriminations*, p. 97.)
1. *Enforcement*.—Mr. BLANCHARD, late commissioner of the Joint Traffic Association, suggests the following as a form which, without legal technicalities, indicates the significance of pooling agreements: "The following railroads (naming them) operating from and through ———, to and through ———, hereby agree that to observe and give due effect to the tariffs from time to time legally issued, they will, from ——— for a period of ——— years from said date, divide their tonnage therefrom and thereto and the earnings produced thereby at the published rates substantially in the proportions in which the shippers have delivered it to them heretofore. The proportions in which the said business shall be carried by the several parties hereto shall be as follows: (Specifying the percentage due to each.) If any company carries more than its said proportion, it shall in the next month transfer such excess of tonnage, computed at the gross rates shown by said established tariffs, to the company or companies in deficit, or, failing to so transfer the tonnage, it shall pay money in an equal or agreed amount within 30 days thereafter." (677.)

Mr. Blanchard also says that pooling agreements do not themselves fix rates, but that rates may change frequently on all or a part of the roads during the agreement. (643, 665.)

Mr. Blanchard points out further that the pools which formerly existed affected only a comparatively limited traffic. Thus the Eastern pools related only to freight from Chicago, Peoria, Louisville, Cincinnati, Indianapolis, St. Louis, to Eastern points. The traffic from Buffalo and Albany, Washington, and other points—Rochester and Boston, for example—was outside the pool, and the same was true of traffic from Cleveland, Detroit, Toledo, Columbus, and other cities. (681, 682.)

Mr. RIPLEY, president of the Atchison, Topeka and Santa Fe Railroad, thinks that if pools are formed they should be formed for terms as long as 5 years. The longer they are the more stable they are likely to be. An agreement for 1 year has an element of temporariness which is unsettling. Mr. BLANCHARD and Mr. WOFFENDIN express the same opinion. (565, 566, 695.)

2. *Outside lines.*—Mr. BLANCHARD says that in the case of the two leading pools which existed before the interstate-commerce act, that between the Eastern lines and that between those west of Chicago, there were a considerable number of lines outside. No threats were made against outside companies who refused to do joint business with them. Nevertheless, the actions of these outside roads finally demoralized business. It appears that the outside roads were largely those connecting points not actually reached by the pooled roads, but nevertheless competing with them as to certain through traffic. In case pools should be permitted in the future, Mr. Blanchard thinks that the only means of influencing outside roads to enter the pool or maintain rates would be by refusing to receive their traffic on the same conditions existing between the concurring companies, or by collectively cutting rates against the outside lines. (681, 682.)

Mr. RIPLEY, president of the Atchison, Topeka and Santa Fe Railroad, would not object to the forcing of all the roads in a competitive district into a pool, but he thinks there are some reasons against it, and he does not think it necessary. If the law permitted the roads which desire united action to combine against the one which would not unite, they could fight it jointly and by legal means, and could effectually regulate it. The trouble now is that when one party "thinks that he can flock by himself," the law forbids the rest to combine against him. A pool among 4 or 5 competing lines would have a very steady effect even if 1 line remained out, especially if deviations from public rates were punished by fines, and the law were well enforced. (595, 597.)

B. Advocates of pooling. 1. *General authorities.*—Messrs. KNAPP, PROTTY, and CLEMENTS, of the Interstate Commerce Commission, agree in favoring pooling on the part of the railways, but only in case much more effective control than at present over rates generally, and especially over pooling contracts, be given to the commission or some other authority. Mr. CLEMENTS especially fears the effect of pooling in raising rates generally. (138, 150, 157.)

Mr. NEWCOMB, of the division of statistics, Department of Agriculture, says that competition in railway rates tends to cause discriminations, and in many instances results in rates below the cost of service. The only remedies are Government ownership or pooling arrangements between railways under Government supervision. Pools are of two kinds, those which simply divide tonnage, and those which divide receipts, letting tonnage take care of itself, such division of profits being guaranteed by a deposit. When such pools were formerly made, before they were prohibited by the interstate-commerce act, they usually broke up soon, because they could not be enforced in the courts. It is now advocated that pools be legalized by an amendment of the interstate-commerce act so that they can be enforced by the ordinary procedure of securing damages for violation of contract. The majority of the railways favor this amendment, as well as a majority of the Interstate Commerce Commission, and many others. The opposition comes from a small part of the people who are ignorant concerning the effect of competition, from certain railway officers who object to the increased power which it is proposed to give to the Interstate Commerce Commission in connection with the change, and from trusts and combinations of shippers which are now able to dictate rates to their own advantage. The witness does not believe that pools would result in higher charges, except where rates are now unjustly low. The rates can never be much increased without shutting out a large amount of traffic which is on the margin of profitable shipment. Such pools should be, however, subject to the approval of the Interstate Commerce Commission, a thing which the railways themselves desire, and should be entirely public. In England pools have been found necessary; in France traffic is divided territorially, and in Belgium even the State-owned roads have been compelled to pool with private roads. (96-98, 103.)

Professor JOHNSON favors trying the practice of allowing the railways to make pools. The chief objection now raised comes from strong railways which are already getting satisfactory rates. Exorbitant rates are not likely to result, especially if proper Government supervision be maintained. (62.)

Mr. REAGAN thinks that in the absence of complete control over railway rates by the Interstate Commerce Commission, the next best method is to permit railways to make pooling contracts, subject to the approval of the commission, with an enforceable penalty for violation. This would go far toward preventing rate-cutting and discriminations. (345.)

2. *Representatives of railways.*—Mr. BLANCHARD believes that the only way to secure uniformity and stability of transportation charges is by association among the railways, by which it shall be made to their interest to secure that result. Every association of railways in the past has had for its primary object the same ends as those sought by the interstate-commerce act. Association and organization among railways is necessary in the same way that association and organization are necessary in any great business or interest having common purposes. Thus, the nation must have its Congress representing the separate States; the President must have his Cabinet bringing together the different Departments. The rates of transportation must be predetermined in order to be announced in accordance with the law. (640, 641, 683.)

According to Mr. Blanchard, the interests of railway investors and employees especially demand protection by permission to secure reasonable profits through a pooling system. The Eastern trunk lines reported in 1894 that their shareholders numbered 99,826; in proportion to mileage the total number of shareholders of all railways would be over 950,000, besides bondholders. There are nearly 1,000,000 railway employees. Since each adult may be supposed to represent five persons, the total number thus directly affected by railway earnings would be fully 10,000,000, aside from those interested in manufacturing railroad supplies. American railway wages are higher than those abroad, and no measure should be taken to force them down. (642.)

Mr. WOFFENDIN, chairman of the Chicago East-bound Freight Committee, favors legalized pooling, and supposes that if pools were legalized they would be under some governmental supervision. He would have pools formed for at least 5 years. The difficulties of creating pools are such that he does not think it would be practicable to readjust the basis of them annually. He thinks that a pool could be so formed that it would do away with discriminations and rebates. To make it operative, penalties for violation of the agreement would have to be provided. He does not wish to express an opinion upon the question whether these penalties should be fines or imprisonment. Fines would be more effective if they were severe enough and were enforced. The enforcement of any penalty seems to be, in the witness's opinion, a matter of some difficulty. (565, 566.)

Mr. CALLAWAY, president of the New York Central, advocates legalizing pooling, so that contracts shall be enforceable at law. Pooling has in the past been especially advantageous in enabling railways to resist the unjust demands of large shippers, especially of private car owners. Discriminations would be lessened and freight rates would not be increased, because of water competition and world-wide competition in regard to commodities. The difficulty with pooling hitherto has been that the various lines were not satisfied with their percentages of business, and there was no way of enforcing agreements and preventing cutting. Mr. Callaway would be willing to give the Interstate Commerce Commission supervisory veto power over pooling contracts. A further advantage of pooling would be the reduction of expenses of various kinds; for example, saving in the maintenance of city offices. Railways which are opposed to pooling are mostly such as connect with the various competing roads, so that they are practically in the position of large shippers. (235-238.)

Mr. INGALLS, president of the Chesapeake and Ohio, believes that the only remedy for excessive competition is to be found in pooling. Unrestrained competition injures railway, shipper, and general public. It is almost sure to result in bankruptcies and to increase speculation in railway securities. Discriminations, also, are due to excessive competition. Agreements between railways, including more than mere pools of traffic or of earnings, should be made legal and enforceable at law. The witness does not think there would be any danger of undue increase of rates if such agreements were permitted, particularly on account of competition of products. (286, 290-300.)

In the opinion of Mr. SPENCER, of the Southern Railway, the legalization of pooling contracts would diminish discriminations, though it would not necessarily do away with them. If pooling were allowed, some authority would have to be provided to prevent unreasonable rates under the pool. The witness does not think

rates would for the most part be materially affected, although in the trunk-line territory some exceedingly low rates might be raised. (280.)

Mr. COWEN, president of the Baltimore and Ohio, thinks that if laws and court decisions had not interfered the railways, under the stress of necessity, would by this time have evolved a system of traffic associations and of pooling which would substantially have prevented discriminations. It was not the thought of the framers of the Sherman antitrust act that it should apply to railways as the courts have interpreted it. The witness favors granting permission to the railways to agree as to rates, including division of traffic, if necessary. He would be willing to have the Interstate Commerce Commission given the power to set aside such agreements without appeal if contrary to the public welfare.

Even if such agreements were permitted, true competition would not be destroyed. Properly there can be no such thing as different rates on different railroads for the same traffic; but with uniform rates competition occurs in furnishing facilities, handling traffic, and presenting inducements to the public. (314, 315.)

Mr. BIRD, general traffic manager of the Chicago, Milwaukee and St. Paul Railway, is very much in favor of pooling. The only persons who could object, provided the Interstate Commerce Commission had proper power to regulate pools, would be those who hope to get discriminating rates. The requirement of the interstate-commerce act that rates shall be reasonable is defeated by the prohibition of agreements concerning rates. Fluctuating rates can not be of advantage to anyone. (474.)

Mr. MORTON, vice-president of the Atchison, Topeka and Santa Fe Railway, declares that rate wars are always injurious to the general public, to the employees, and to the carrier. Stability in freight rates is as essential as in import duties. Uniformity of freights as between individuals is especially important to all classes. The witness accordingly advocates the legalization of pooling. This would tend greatly to prevent unjust discriminations between shippers and between places, to create stable rates, check disastrous competition, prevent the reduction of wages, and afford protection to the railroad investors. It is not in restraint of trade in the sense that ordinary combinations would be, since the Government undertakes to regulate railway charges. Unless pooling is permitted concentration of ownership will increase. Even with greater concentration pooling would still be advantageous. If a certain group of railways should be combined there is yet always a tendency toward competition between different markets. (491, 495, 499.)

Mr. FISH, of the Illinois Central, says that his own railway, since fully 85 per cent of its traffic is local, is not especially interested in pooling. It has not sought for competitive business, since there is not much profit in it. Nevertheless, the witness thinks pooling would be advantageous to many railways, although it will not be a panacea or prevent rate cutting and discriminations. (337.)

3. *Representatives of shippers.*—Most representatives of shippers favor pooling only on condition that effective public control be exercised. See Paragraph F.

Mr. KELLEY, freight commissioner of the Trades League of Philadelphia, thinks that unless pooling among railways is allowed they will be driven mere and mere into consolidated systems. The weaker railroads will be unable to compete and will be controlled by the stronger. All the railroads east of the Mississippi are likely in a few years to come into the hands of a very few men, who can fix rates to suit themselves. (190, 191.)

Mr. BACON, of the Milwaukee Board of Trade, favors permitting the railways to pool their earnings or traffic. This would be the most effective remedy for rate cutting and discriminations between persons and places.

The witness read from a letter of the secretary of the Chamber of Commerce of Milwaukee, declaring that that body has repeatedly advocated pooling. He also submitted a letter from Mr. Robert Elliot, a member of the Milwaukee Board of Trade, upholding the views just presented. (420, 426.)

Mr. COUNSELLMAN, a grain dealer of Chicago, thinks that the only remedy for railroad discriminations and rate cutting is pooling. Even where some railroads are willing and able to do a satisfactory business at fair rates another road with inferior equipment and facilities will come in and try to get business by lower rates. It is true that railroads might try to increase their percentage under a pool by rate cutting, but in general this attempt would be made by the weaker roads, and the strong roads, which felt satisfied, would be likely quietly to buy control of them. The witness would favor giving the Interstate Commerce Commission absolute authority to limit the maximum rates to be charged under pools. Shippers should be allowed the privilege of sending freight over any line they preferred; the railroads would not care if this were permitted. (390, 391.)

4. *Public opinion concerning pooling.*—Mr. BLANCHARD quotes from a number of important authorities indorsing pooling. He says that practically all of the witnesses who appeared before the Cullon committee in 1886 favored pooling, although some desired certain restrictions. That committee reported in its bill a provision that the Interstate Commerce Commission should inquire further as to the wisdom of pooling and report to Congress. Judge Reagan, who was then chairman of House Committee on Commerce, was the most influential in amending the bill so as to prohibit pooling, and he has since changed his opinion and advocates permitting railroads to enter into traffic arrangements. The Interstate Commerce Commission has several times advocated pooling. Judge Cooley, its first chairman, has repeatedly defended the system. Very large numbers of commercial organizations and trade bodies have at different times declared in its favor, including the National Board of Trade. The national convention of State railway commissioners in 1894 and 1896 took a similar position. The minority of the Supreme Court of the United States in the case of the Trans-Missouri Freight Association declared that agreements as to reasonable rates conformed exactly to the purpose of the antitrust act. (641, 642, 648, 649.)

Mr. RIPLEY, president of the Atchison, Topeka and Santa Fe Railroad Company, thinks that the sentiment of nearly all the members of the mercantile community that have had the largest dealings with railroad companies is in favor of pooling. The chairman and the majority of the Interstate Commerce Commission, and, Mr. Ripley thinks, a majority of the State commissioners and a majority of the shippers of the country, are in favor of it. For every opinion against it, ten can be produced in favor of it, from merchants and shippers, State and interstate commissioners, students of political economy, and almost all who have dispassionately studied the transportation problem. (593.)

Mr. BOOKWALTER does not think the views of business men in his section of the country are well defined upon legalized pooling. (576.)

C. *Opponents of pooling.*—Mr. STONE, secretary of the Chicago Board of Trade, objects to railway pools, because "they are in restraint of trade, they prevent competition, they are monopolistic in purpose and effect, they are odious in law, they are subversive of the very interest which railways were created to conserve, viz, the general welfare, in so far as that welfare relates to the functions and obligations of a common carrier." The pools which formerly existed, "although ostensibly for the equalization of traffic compensation, for the encouragement of feeble lines, and opposed to any unfair and unjust proportion of remuneration received by great and controlling trunk lines, degenerated into a recklessness and unscrupulous abandonment of the terms of such agreement, creating confusion, distrust, an unsettling of freight rates, antagonism, and a general warfare, resulting in disaster to many of the parties to the pools, as well as to the business interests generally." Mr. Stone does not believe, in view of the enormous extent of the business and the vast number of rates to be fixed, that it is practicable to place pooling under the control of the Interstate Commerce Commission in any sense that would protect the vast business interests of the country. (532-535.)

Mr. HYLAND, traffic manager of the freight bureau of the Chicago Board of Trade, believes that a large majority of the members of that board and of the general public oppose legalization of railroad pooling as contrary to public policy and not calculated to secure the results claimed for it. In would, in fact, result in minimum service at maximum cost. Railroads would still continue to make special concessions in rates in order to establish their claim to an increased allotment in the pool, as has been especially demonstrated by the work of the Southwestern Railway Association. The witness thinks that the so-called strong lines, more than the weak ones, lead in violating traffic agreements.

On the other hand, Mr. Hyland would favor granting permission to railways to make agreements concerning rates, giving the Interstate Commerce Commission full power to regulate and control the rates. (351-353.)

Mr. VANLANDINGHAM, commissioner of the St. Louis Traffic Bureau, does not think that pooling is desirable either from the standpoint of the carriers or of the general public. It would not remove the incentive to reduce rates or to make discriminations. Mr. Vanlandingham, however, favors agreements as to rates.

The witness thinks that consolidation of railways is more advantageous than legalized pooling. He does not so much oppose pools themselves as the proposition to make the pooling contracts enforceable at law. (214, 216.)

Mr. STICKNEY, president of the Chicago Great Western Railway, does not think that pooling would realize the expectations of its advocates. If a pool should be formed on the lines between Chicago and St. Paul for the purpose of maintaining rates, St. Paul would be injured, unless pools were also formed on the roads from Chicago to Kansas City and other points. When it was possible to repudiate a pooling contract if it proved unfair, railroads were willing to pool; but if the

contract is made binding, affecting, as it does, millions of dollars monthly, no railroad would ever make such a contract. (463.)

Mr. CARTER, a commission merchant, is unalterably opposed to pooling. He thinks railroads should be no more exempt from competition than other lines of business. Pooling would be less objectionable coupled with adequate authority in the Interstate Commerce Commission to regulate rates and to sanction, or refuse to sanction, any pooling contract; but we have not reached such a point in the supervision of railroad affairs that we can consider it from that standpoint. (585.)

See also under paragraph F.

D. Railway competition—should it exist?—1. Negative.—Mr. KNAPP, chairman of the Interstate Commerce Commission, believes that it is unwise to attempt to foster competition among railways or to treat them as purely private businesses are treated. In ordinary business, where property and things, as distinguished from public services, are dealt in, there should be the greatest freedom of contract, and no attempt to impose uniform prices. In fact, competition means discrimination; that is, difference in prices at different times and places and between different individuals. Thus, with regard to trusts and combinations, it will probably not be possible to control them by means of fixing prices. If prices were fixed it would be impossible to compel producers to sell any more than to compel consumers to buy. On the other hand, in railroad service competition is possible as regards only a small portion of the entire territory and population of the country. To most people railroad service must be monopolistic. It is, moreover, essentially public service. There can, accordingly, be no gain from freedom of contract or from lack of uniformity in charges, but, on the other hand, industrial freedom can not be secured without equality in charges. On account of the public nature of railways, the people can interfere directly, as they are not justified in doing in regard to ordinary business. Even such regulation as is now applied to railways would be out of the question as regards truly competitive business.

It may be true, Mr. Knapp admits, that competition among railways, in its broadest sense, has reduced rates over the entire country, but at the same time it has caused many discriminations, and the same advantages can be better secured by public regulation. The antitrust laws and the prohibition of pooling have not been of any benefit whatever to producer or consumer; but have been a chief cause of discriminations. (138.)

Mr. NEWCOMB declares that discriminations in railway rates spring almost always out of excessive competition, and can be prevented only by allowing pooling or some other form of combination between railways. Competition in other lines of business results in uniform prices, but in the case of railways the patronage of large shippers is so important that special rates will be made to secure it, often at less than the cost of service. The interstate-commerce act has failed to check such discriminations, and although there is at present a cessation of them for the most part, it can not be permanent so long as competition is compelled by law. The antipooling clause has tended to increase discriminations, and no government supervision can prevent them. (95-97.)

Professor SELIGMAN, of Columbia University, says that both competition and monopoly have their good sides and their bad sides. Through the force of competition new efforts are continuously made and new machines are introduced, by which cost of production is lowered. All progress, which depends directly upon the lower cost of production, depends indirectly upon the competition between producers. This competition works through the effort of every buyer to get a little lower price than his neighbor gets. Competitive enterprise means preferring one customer to another, giving advantages to the large buyer over the small. When competition is applied to a public or quasi-public institution, like the railway, this feature of competition is inconsistent with the highest social utility. Everybody ought to be put on the same level. Competition should continue in respect to the constant effort to obtain the best appliances and to give the best service; but there ought not to be any competition as to rates. It is out of competition in rates that discriminations, both personal and local, come.

The good side of monopoly is that it may prevent the difference in the treatment of individuals which is due to competition. Of course, there may be personal discriminations due to the whim of the monopolies, and the experience of California, where there is practically no competition in the railroad business, shows that there may be just as serious evils under the monopoly system as under the competitive system. In France also, where each railway has a monopoly of its own field, the evils of noneffective management, lack of facilities, etc., are prominent. The question is whether it is not possible to devise some scheme which shall reduce the evils of both systems to a minimum and increase the advantages of both systems, competition and monopoly.

The witness believes that pools and traffic associations are the best system thus far devised for getting these advantages. Pooling need not bring any cessation of competition as regards facilities. Each railway in past pools has tried to increase its efficiency and its traffic in order to pave the way for an increase of its percentage when the pool should be renewed. But a well-devised pool avoids the evils of competition, cut rates, personal discrimination, and, to a certain extent, illegitimate and indefensible local discrimination. It would not do to allow the railways to do what they choose with their pools. It is necessary to regulate and restrict them. The railways must be regarded, not as a private business, but as a trust for the public.

Wherever any vestige of competition among railroads is left, in all countries of the world, there are pools and traffic associations. Even where the government runs the railways it forms pools and traffic associations with privately owned railways. Such facts show that there is some underlying cause which makes these things inevitable. (615-617.)

Mr. BLANCHARD points out that competition as applied to railways is essentially different from that in ordinary commercial transactions. The contests between buyers and sellers in ordinary cases are carried on under fair conditions. Differences in the conditions and facilities of the sellers, in the outlook of the market, in the credit of buyers, etc., justify different charges for the same goods. But when railways compete they are not governed by uniform rules applying openly and impartially to all. One company can reduce its rates from various motives, and thereby force all other companies connecting the same points to meet the rate. There can not be different rates for the same haul. Moreover, the cutting of rates between two points will affect the rates between altogether different points which compete for certain classes of traffic. Thus, to reduce the through rates from St. Louis to Boston would affect the rates from Chicago to every seaboard city. Moreover, under the law concerning long and short hauls a cut in competitive rates to terminal points affects also the rates to numberless intermediate points which can not legally exceed the through rate. When competitors in ordinary lines of business lose money by unduly low prices they fail and go out of business. Insolvent railways are required to continue in business and are often the most dangerous competitors. (635-637, 653.)

Mr. Blanchard declares further that competition between railways induces secret rates and discriminations, so that it can not be considered fair. By such discriminations the one railway is injured by losing its profit and its competitor by losing its business, while the merchant or producer competing with the favored shipper may be ruined. If all of the railways should give one grain shipper an advantage of a cent per 100 pounds, he might ultimately control the grain markets of the nation, and the same tendency exists to a less degree wherever a discrimination is granted. Some shippers become dealers in rebated railway earnings and make their profit chiefly from this source. In fact, those who chiefly oppose pooling are shippers and railways which profit by disobeying the law requiring uniform rates. (635, 636, 653.)

Many prominent authorities, Mr. Blanchard declares, have expressed themselves clearly as to the impossibility or undesirability of railway competition. Thus Interstate Commerce Commissioner Schoonmaker has stated that it is a "now fully demonstrated fallacy that unrestricted competition among railways is a public benefit." Judge Cooley and Mr. Knapp of the commission have expressed similar opinions. In 1882 a joint report by Messrs. Thurman, Washburn, and Cooley declared that "this is not what in other business is known and designated as competition." The Cullom committee in 1886 attributed personal discriminations largely to competition. The convention of State railway commissioners in 1899 declared that the policy of unrestricted competition has been steadily working out its own destruction. The great English commission on railways in 1882 declared that reliance on competition to regulate railway rates was a failure. (637, 638.)

Mr. Blanchard says further that competition in railway rates is as impracticable and undesirable as competition between different officers in the Government service. Uniform rates to all persons and stable rates are as important in railway service as in taxation and postal charges. The Government assures to all persons the impartial and unabated collection of its charges. The witness presented statistics of the amount of Government bonds and interest charges as compared with those of railways to indicate the relatively greater importance of just railway charges than of just Government charges.

Mr. Blanchard declares that if the Government itself owned the railways it would have to apply the same rules as to uniform charges which apply in the custom-houses and the post-offices, and no one would think of declaring that this system was in restraint of trade or of legitimate competition. So, too, if the Government should operate a single railway, such as the Union Pacific, it would find that

it could fix its rates only after consultation with other companies performing similar service, as has already been shown by the experience of government railways in Europe. (638-640.)

Mr. RIPLEY says that when competition in freight rates has had full sway it has unsettled values, disarranged the plans of merchants, and wrought general destruction, and the tendency of it is to concentrate business in a few hands and to drive out the small trader. (593, 594.)

Mr. GALLAGHER is informed that rate wars have frequently been started for the purpose of lowering the price of stocks after inside speculators have made heavy sales. (542.)

Mr. TUCKER says that railroading is simply a commercial transaction; it is selling transportation. Railroads, however, unlike other commercial enterprises, are obliged to sell at a common price, and he does not consider that transportation is a thing to be sold or bartered at varying prices as commodities are. It is the nation's business to see that discriminations in the price of transportation cease. (560, 561.)

Mr. SARGENT, grand master of the Brotherhood of Locomotive Firemen, says that rate wars are injurious to all parties concerned. The moment a company begins carrying goods and passengers at less than cost it must discriminate against other persons or places, or must make unwarranted economies at the expense of the condition of the road or of the employees. Rates have often been put in force which anyone could tell at a glance to be far below the cost. If railway officers can not prevent such disastrous competition, the Government should step in and fix the rates. (69.)

Mr. O'ROURKE, switchman, of Chicago, believes that the interest of railroad workers demands profitable rates for the railroad companies. Whatever strengthens the earning powers of the company will be beneficial to the man who works for it. The most prosperous corporation is the most agreeable one and the most profitable one to work for. Excessive competition and rate wars, resulting in the performance of service by the companies at a loss, must result in diminution of the earnings of the workmen. (526.)

2. *Affirmative.*—Mr. STICKNEY, president of the Chicago Great Western Railway Company, criticises the position of Mr. Knapp as to the desirability of uniformity in railway rates. The sale of transportation is like the sale of other commodities. A manufacturer may put out a catalogue of goods with certain prices, but the real prices will be different unless customers are found at the published prices. We may want uniform charges on railways, but we can not get them, any more than it can be made possible for the poor man to buy ordinary commodities as cheaply as the rich. If a railroad can not sell its transportation at one price it should be allowed to lower the price immediately without any publication of notice. (460. See also p. 92, above.)

Mr. STONE believes that in railroad business, as well as in other kinds of business, competition is the best regulator of prices and the best incentive to progress. It is competition, not the will of railroads, which has reduced our transportation rates and given us the facilities for transportation of persons and property which Mr. Stone believes to be better than those of any other country. Competition has been of benefit to those railroads which have been most subject to it. He instances the great trunk lines which have had to compete with the cheap transportation of the Great Lakes and the Erie Canal. The railroads had to reduce their rates, but the volume of business increased so largely as to make them the most prosperous lines of railway in the country. Mr. Stone would not, however, have the Government reduce the rates, in the expectation that such a reduction would have the same favorable effect. He thinks that competition will fix rates better than the Government can. He apparently prefers the introduction of competition by the building of parallel lines of roads to Government regulation, which might be intended to have a similar effect upon rates. (533, 536, 537.)

E. Effects of pooling.—The opinions of various witnesses as to the effects of pooling have already been stated in connection with their general arguments for or against the practice, paragraphs B and C. See also *Consolidation of railways*, p. 37; *Discriminations between individuals*, p. 43.

1. *Rates and competition.*—Mr. BLANCHARD holds that railway pooling would not merely be beneficial to the railways, but also to shippers and the general public. The benefit to railroads may be measured by the evils of unrestricted competition already mentioned. If pools were permitted for reasonably long terms bad methods would be forgotten, and the railways would abolish needless officers and save many expenses growing out of excessive competition. (683.)

The effect upon rates could not be to make them unreasonable. For one thing, pooling agreements do not specify rates, as is frequently supposed. They provide

a division of tonnage or earnings for a fixed period of time, whereas conditions of various sorts may cause fluctuations in the rates during the agreement. More-over *some* standard of rates must be reasonable. If the rates charged by railways in pools are thus reasonable, it is entirely impossible to show how the public interest is affected by any division of the proceeds among the railways. It is only when pools are used to sustain excessive rates that they are objectionable, and then the remedy lies in the correction of the rates and not the prohibition of pooling.

In Mr. Blanchard's opinion, however, competition would still be a sufficient preventive of excessive rates under pools. There would still be a fair competition between the pooled railways themselves, in the way of furnishing improved facilities or otherwise attracting traffic. The most important competition, however, would be that between railways in different sections, created by the laws of trade and the endeavor to reach common markets. The competition of water carriers has been an effective element in the past, and would continue to be. The competing water routes or railways need not be close at hand. A route from Chicago through Canada, or from Cincinnati to Newport News, fixes rates from Pittsburg to New York. (683.)

Mr. Blanchard criticises especially the arguments of Mr. Prouty on this subject in an article in the Forum. Mr. Prouty speaks of the monopolies which would arise if the six railroads connecting Chicago and Kansas City should combine. Mr. Blanchard replies that river traffic between Kansas City and St. Louis, traffic by way of rail and water to the Gulf, traffic between Omaha, Sioux City, and St. Paul, and Chicago, and still other traffic, would compete with that over the pooled railways and would prevent unjust charges. Pooling would not give the carrier absolute power over rates. Mr. Prouty himself has spoken of water competition as a potential factor, and of reduction in rates between Chicago and New York forcing down rates at other points. Mr. Prouty's statement that it is reasonably certain that railway lines terminating at Galveston would pool with lines terminating at Boston is unwarranted; such a pool is highly improbable and without precedent. Anything like a universal pool is out of the question. (666.)

The pools which existed before 1887 had none of the disastrous effects which are now held up as likely to result from pooling. They did not stop the construction of new lines nor destroy competition. Although there were no water routes from Pittsburg and other interior points to the coast, those points were given the advantage of the same rates to New York as Buffalo, which had canal competition. The railways sought to build up a large local and through traffic at low rates. The trunk line association reduced tariff rates from 71 cents in 1877, when first organized, to 50 cents in 1886, and there is no instance of rates having been advanced unless to restore unjustifiable rate-war reductions. (643-647, 653-656.)

The witness points out further that a combination among railways is not similar in character to an industrial trust. Railway rates and fares must be publicly announced, must be actually or tacitly approved by the Government, and are subject to a much greater degree of competition, in the way of water routes, foreign markets, etc., than trusts are subject to. Railways must make public reports. Railways never tend to restrict trade, but always to enlarge it. No railway is ever closed by a pool, or driven out of business by competition, whereas trusts may close part of their own plants or force competitors to close theirs. In every way the situation and conditions are different.

Our experience with telegraphs, Mr. Blanchard declares, shows the advantage of combination. Formerly there were disastrous contests in rates, private discriminations, and other evils. The Western Union Company after its consolidation introduced economies, increased facilities, reduced charges, and especially made its rates uniform to all persons. (645-647.)

Mr. RIPLEY says that no pool can change the general laws of competition. There is no possible danger of an extortionate rate; there is no such thing in this country, and it is impossible. (593, 595.)

Referring to the statement of Mr. Stone (p. 532), that the Southwestern Traffic Association was a "vampire, which for a decade sucked the lifeblood of the commerce of the Missouri Valley," Mr. Ripley points out that during the decade referred to, say from 1877 to 1887, the population of Kansas City increased from 58,000 to 156,000, and that of Omaha from 25,000 to 110,000, and that the whole Missouri Valley was in a state of great prosperity. It is untrue that rates were advanced under this pool. Advances may have been made at times on certain commodities, but far more rates were reduced, and the general average for the 10 years would show a steady reduction. It is not claimed that the agreement worked perfectly or that no discriminations existed, but discriminations were far less common and less disastrous than those which have existed since the passage of the interstate-commerce law. When at intervals the

pool was temporarily broken and competition had full sway, the result was unsettling of values, disarranging of the plans of merchants, and general destruction. (593.)

2. *Effect on discriminations.*—Mr. BLANCHARD insists that pooling is the only effective remedy against discriminations. It must be made to their interest not to discriminate or to allow discriminations. Those directly in contact with railway affairs must remedy the evil. Only the possibility of agreeing for a considerable length of time will make possible the abandonment of existing methods and the establishment of effective instrumentalities for checking discriminations. The witness denies that there would be a considerable temptation for one railway to increase its share of business by discriminations. Each railway would have to account for all traffic at the tariff rates, and if it secured an excess of traffic by rebates, it would lose not only by having to pay the rebates, but by having to account for its excess tonnage. Under pools there would be more uniform and rigid inspection of shipments, tending to check the increasing practice of misdescription of goods on the part of the shippers which results in discriminating advantages. Intermediate towns would be benefited by pooling, since the discriminations which are now made chiefly in favor of terminal points and shippers at those points would be done away with. (644, 675, 676, 683.)

Mr. RIPLEY, president of the Atchison, Topeka and Santa Fe Railroad Company, says that pooling is not a cure-all, but is the best known remedy for discriminations between individuals and localities. Mr. Ripley quotes an Interstate Commerce Commissioner as saying that the prohibition of pooling in the interstate-commerce act defeats the whole purpose of the law: that the law prescribes uniform rules and forbids the only known plan by which rates can be kept uniform. Mr. Ripley asserts that discrimination can never be prevented by law; it can be prevented only by making it the interest of the railroads to maintain equal rates. This can be done only by allowing the formation of pools.

Mr. Ripley thinks that the prohibition of pooling by the interstate-commerce law has done more to concentrate business in a few hands and drive out the small trader than could have been accomplished in a century of the old methods. (594, 596.)

Mr. TUCKER, of the Central Freight Association, is inclined to think that the legalized pool, under proper conditions, is the greatest incentive to stability and maintenance of reasonable rates. He thinks that pooling would do away with discrimination, and that it would also remove the feeling which shippers sometimes have that they are discriminated against, when they really are not. (558.)

Mr. MUSSELMAN thinks that pooling should be legalized under the supervision and direction of the Interstate Commerce Commission. There would not then be any inducement to cut rates. The railroads could carry freight at a lower rate, because they would not be carrying a large amount of freight at less than cost, suffering a loss which must be made up on the rest of the freight. The roads say that they do not cut rates east of Chicago, but they do cut the rates from Chicago and from the Mississippi River points to the seaboard, and the trunk lines carry this cut-rate freight across the Middle States and accept their proportion of the rate. The shippers in Michigan, Ohio, and Indiana must necessarily pay higher rates to make up for the unjustly low rates which the more distant shippers get. (557.)

Mr. VANLANDINGHAM, however, thinks pooling would not check discriminations or rate wars. A company which by chance has been allotted more than its proportion of traffic will cut rates to keep its proportion up. Since changes in allotments are made from time to time, each road will be tempted to cut rates in order to increase its volume of business so that it will receive a greater proportion the next time—a practice which has been the means of breaking up all previous pools. The large shipper would still be able to dictate to the railroads and to secure discriminations by offering to the railroads as an organization large shipments at times when they were especially desired. Since the pools would not affect local business, people living at small stations would clearly not be benefited. Mr. Vanlandingham believes that it would be possible to check rate cutting and discriminations legally without pooling agreements. Even weak as the interstate-commerce law is, he thinks that 35 per cent of the rate cutting which existed during 1898 was wiped out during 1899, largely through the influence of the law, and if the law be properly amended it can be made much more effective. (214, 216.)

Mr. HYLAND presents practically the same argument. (351.)

Mr. STONE thinks that pools are based on the amount of traffic which each road has previously carried. It is not necessary, however, that this be made the basis,

and it is probably modified by other considerations. If this basis were followed strictly the force of competition and the consequent tendency to discrimination would hardly be lessened. Each road would still desire to increase its business, with a view to the next traffic division. (535, 539.)

Mr. RIPLEY, president of the Atchison, Topeka and Santa Fe Railroad Company, on the other hand, states that no pool was ever formed on the basis of the proportion of the business done by each railroad the previous year. Such an arrangement would give the same incentive to make concessions that now exists. When there were pools, some of the railroad people sometimes thought that by increasing their tonnage one year through illegitimate methods, they could secure a larger percentage in the pool the next; but they very seldom succeeded. Nobody would be willing to recognize the business done by illegitimate methods as the basis of division. The proportion was sometimes settled by mutual agreement, but usually there was a provision for leaving it to an arbitrator in case of failure to agree. (596.)

3. *Selection of routes.*—Mr. VANLANDINGHAM thinks that the shippers would, if the pool involved division of traffic and not merely of earnings, be deprived of their right to ship freight over any line they saw fit. Shippers often have good reason for selecting particular lines. (214.)

Mr. BLANCHARD holds that under pools shippers could still continue to choose their own routes. Only the traffic of consenting shippers would be transferred. If smaller shippers consented to such a transfer for the sake of preventing discriminating rates, this would serve as an argument in favor of pooling. As a matter of fact, pools provide for dividing competitive traffic substantially in the proportion of the previous tonnage of the roads, so that little diversion of tonnage or revenue is necessary. In the last year of the eastward pools from Chicago and other cities the tonnage actually changed from one route to another was only 2.2 per cent of the total, and the transfer of earnings on pooled freight only about 22 per cent. (644, 645.)

Mr. CALLAWAY also thinks shippers could choose their own routes, the railways dividing earnings instead of tonnage when necessary. (236.)

F. *Control of pooling by Interstate Commerce Commission.*—Many witnesses, including representatives of the railways, think that considerable control over the formation of pools, and over rates under them, should be given to the Interstate Commerce Commission. The following witnesses mention this point incidentally in connection with their arguments favoring pooling: NEWCOMB (103), JOHNSON (62), REAGAN (345), WOFFENDIN (565), CALLAWAY (236).

The members of the Interstate Commerce Commission believe that a large measure of control over the contracts between railways and over their rates ought to be given to the commission. Otherwise, freedom of contract might become a means of increasing rates generally and injuring the public. Mr. Clements especially insists that railways have usually sought to make pools in order to get more money out of the business, and that consequently unregulated pooling might tend toward excessive rates. There might be some difficulty in imposing effective checks upon rates under the pooling system. (KNAPP, 138; PROUTY, 150; CLEMENTS, 157.)

As to the attitude which the railways would be likely to take toward a proposition for the repeal of the antipooling clause, coupled with supervisory control over pooling and rates, Mr. Knapp stated that a change would doubtless be favored by some roads which at present suffered from sharp competition to such a degree that they would be willing to submit to rather drastic requirements. On the other hand, some railroads have, by consolidations and otherwise, got into a position where they do not suffer from excessive competition and do not care for pooling. At the same time the great combinations, whose shipments are so large as to be of first consequence to carriers, will be likely to oppose such legislation and to influence the railways to oppose it. (141.)

Mr. BIRD thinks the Interstate Commerce Commission should have the right to approve the rates under pools in the first instance and to discontinue the pool at any time if the rates were unjust. (471.)

Mr. RIPLEY, president of the Atchison, Topeka and Santa Fe Railroad Company, says that he would not object to a revision by the Interstate Commerce Commission of the rates charged by a pool, although some railroads might. (595.)

Mr. INGALLS would even be willing to have the decisions of the commission concerning the reasonableness of rates under agreements final without appeal, (300), and a similar position is taken by Mr. COWEN (315) and Mr. COUNSELMAN. (391.)

Mr. KELLEY thinks pooling should be subject to the supervision of the Inter-

state Commerce Commission, at least to the extent of allowing the commission to declare pooling contracts unreasonable and inoperative until upheld by a judicial body. (190, 191.)

Mr. BACON holds that rates fixed under pooling contracts should require the approval of the Interstate Commerce Commission and be subject to change by it at any time. The actual rates should be fixed by the commission where necessary, rather than maximum and minimum rates. (421.)

Mr. MORTON advocates giving the Interstate Commerce Commission power to revise the rates fixed by the pool whenever complaint should be made. It would be as important for it to prevent rates unreasonably low as unreasonably high. In case of appeal to the courts, the witness would be willing that the decision of the commission should remain in force temporarily, at least as regards rates under pooling contracts. The witness thinks further that the commission should have some control over the rates of railroads which should refuse to enter pools. Especially ought the roads which should enter the pool to be protected against secret and preferential rates made by any outside line. The witness has known of cases hitherto where pools have been made without bringing in all the roads in a section, the pooled roads acting as a unit in meeting competition of the outside lines. (491, 495, 496, 499.)

Mr. EVANS, a miller of Indianapolis, says that the general feeling among the millers seems to be in favor of pooling, but only under the supervision of the Interstate Commerce Commission. (441.)

Mr. BARRY, of the Millers' National Association, would not favor pooling unless the power of the Interstate Commerce Commission was very greatly enlarged. Under the present law pooling would simply strengthen the position of the railways in their unjust action toward shippers. (247.)

Mr. BLANCHARD suggests, incidentally, that the "interposition of the courts under an amended and swifter procedure, or due enlargement of the powers of the Interstate Commerce Commission, would fully protect the shippers and others involved." He would be willing that the agreements themselves should be submitted to the commission. But apparently he would give the commission no other power as regards rates under pools than as regards rates in general. For his opinion as to this power see p. 113. (640, 643, 678, 682.)

Mr. FULLER, of Norfolk, Nebr., is opposed to permitting railways to pool, since it would practically prohibit competition, unless the Interstate Commerce Commission be given thorough control over the pool. (445.)

G. Pooling in foreign countries.—Mr. BLANCHARD cites a number of authorities to show the existence of pooling in foreign countries, even in the case of government-owned railroads. He says that a series of conferences were held from 1874 to 1890, between representatives of Switzerland, Austria-Hungary, Belgium, Germany, Italy, and the Netherlands, with a view to adjusting tariffs on international competitive traffic. Such an agreement was ratified by all the participating nations, and went into effect in 1893. (640.)

In England, where railways are all privately owned, several writers declare that pools are common. Mr. Acworth says that there seems to be no popular objection to them, and that the railways continue to compete for traffic, notwithstanding their division of earnings. He mentions two specific pools as illustrations. The royal commission of 1887, appointed to inquire into the railway system, advocated permitting railways to pool without any control further than that the particulars of the agreement should be made public in the locality. In a prominent case before the courts the vice-chancellor declared that such agreements were legal in principle, and were not prejudicial either to the shareholders or to the public, and this appears to be the uniform attitude of the courts. (649, 650.)

The pools in England, Mr. Blanchard continues, are usually called joint purses. Aside from the regular pools there are associations of committees of railway managers, which agree as to rates. There are various district committees which hold stated meetings. If a company desires to change its rate, it consults its competitors and connections in conjunction with these committees. The result is that there is a great stability and uniformity in the rates, and practically no discrimination. The witness has been told by railroad officers that more than 99 per cent of the entire business of the British Islands is probably carried on established rates. Mr. Blanchard also refers to the railway clearing house in Great Britain; but its purpose is simply the adjustment of accounts, and it does not constitute a pool or an association for fixing rates. (664, 680.)

Mr. Blanchard refers especially to the testimony of President Hadley, of Yale University, before the Senate select committee on interstate commerce in 1885.

President Hadley then declared that no nation has succeeded in prohibiting discriminations and pooling at the same time. In Europe general pools are organized much more completely than we have any conception of in this country, and are not merely recognized, but enforced by law. This is true in France, Belgium, and Austria, and to a less extent in Italy. And in most of these countries the pools include government railways and private railways alike. Thus, about 1860, the competition between the government railroads and the private companies in Belgium led to discriminations, in which the Government itself was the worst sinner, as well as to disastrous rate wars, and the difficulty was only terminated by an inflexible pooling agreement. The railroads of Prussia were also largely pooled before the government owned practically all of the lines. (651, 652.)

H. Traffic associations and other agreements.—1. *Argument favoring.*—The distinction is drawn by several witnesses between pools and other forms of agreement, such as those regarding rates. These latter are also advocated, even by two witnesses who oppose pooling. See Paragraphs B and C: INGALLS, COWEN, HYLAND, VANLANDINGHAM. (214.)

Mr. BIRD, of the Chicago, Milwaukee and St. Paul Railway, complains of the injustice of prohibiting agreements between railways as to rates. Since the decision of the supreme court in the trans-Missouri Freight Association case the gatherings of railway officers for the discussion of rates can not be called associations. There is simply a conference and a statement by different officers of what their own roads think ought to be done or will themselves do. But there is no way to prevent discriminations and fluctuations of rates without such conferences, and more formal agreements are desirable. For instance, if one of the roads from the Missouri to Chicago makes a different through rate from the other, since the through rate is also the maximum rate for a large number of smaller intermediate points, and since the two roads are only a few miles apart, the towns on the one road are discriminated against by the lower rates on the other. (478.)

2. *Kansas City Lines.*—Mr. BOOKWALTER has little doubt that some sort of agreement, probably not amounting to a pool, exists on the roads running into Kansas City. This is indicated by the fact that the Union Pacific, which ends at Kansas City and has elevators there, makes the same discriminations against Kansas City and in favor of other markets which are made by roads which run to those other markets. The Union Pacific is compelled to accept the terms made by the other roads, because if it did not they would revenge themselves upon it elsewhere. (573, 576, 577.)

3. *Joint Traffic Association.*—Mr. BLANCHARD says that the Joint Traffic Association was in existence for about 3 years, until held illegal by the United States Supreme Court. It included substantially all the railways south of the Great Lakes and the St. Lawrence River and east of a line from St. Louis to Chicago. There were 32 signers to the agreement. The roads affected carried about 78 per cent of the tonnage of the United States, but the agreement related to through traffic only. It was also provided that any company not a member of the association might appear and argue its case. The association appointed 9 managers. These 9 discussed 22,000 subjects during their administration. (678, 681.)

4. *Central Freight Association.*—Mr. TUCKER, chairman of the Central Freight Association, states that this organization is the successor of the Central Traffic Association. It is composed of about 60 railroads. The boundary of its territory runs from Chicago west to the Mississippi River at Burlington, down the Mississippi and up the Ohio to Pittsburg; thence to Buffalo, then, crossing the Canadian frontier, up to Mackinaw, down the east bank of Lake Michigan, and back to Chicago. The association holds meetings twice a month, attended usually by the general freight agents or the freight traffic officials of the different lines. The purpose of these meetings is to consult about matters of common interest and to see what are the necessities for reduction or advance of rates. There is no binding agreement between the roads; each road is at liberty to do as it pleases. If any road desires to make any given rate it is customary to communicate the desire or intention to the other roads interested. The question will then be discussed and each road will state what it wishes to do. Mr. Tucker does not think that any pressure is brought to bear on the individual members to charge a rate agreeable to all. In the end all the roads must necessarily adopt the lowest rate which any road insists upon making. There could not be an understanding that different roads should charge different rates on the same traffic; those that charged the higher rates would get no business. In case any member of the association makes a cut rate the only action taken is the action of the individual roads in meeting it. The association as such takes no action. Mr. Tucker does

not remember any case in which correspondence on such a subject has passed through the association.

Besides the information supplied to the association by each of its members, the association gets information of all new tariffs from the files of the Interstate Commerce Commission at Washington. (557-559.)

5. *Chicago East-bound Freight Committee.*—MR. WOFFINDIN, chairman of the Chicago East-bound Freight Committee, states that this organization is a statistical bureau, of which 10 eastern trunk lines, and also the C. & E. I. and C., I. & L., are members. The several roads are represented upon the committee by their principal freight officials in Chicago. The committee keeps a record of all the industries around Chicago and the connection they have had with various roads, the various rates they get, and what rates should be fixed to reach them. It keeps a record of minimum rates, so that it can know at any time what the minimum rate is from Chicago to any Eastern point. If a road reduces the rate, the committee makes a record of the change and advises the other roads. It receives from the several roads the same tariffs which they file with the Interstate Commerce Commission. It has nothing to do with the rate-making power, and the witness is not in a position which enables him to judge as to the existence of rebates or other forms of freight discrimination. (565.)

VIII. PASSENGER TRAFFIC.

A. *Passenger fares.*—1. *General influences affecting.*—MR. BLANCHARD, late commissioner of the Joint Traffic Association, enumerates various causes for the differences in passenger rates which exist in different parts of the country. Among these are provisions of charters and laws, the dissimilar volume of passenger traffic on different lines, inequality in the cost of railway construction and operation (as, for example, the differences between mountain roads and those in level country), differences in the cost of terminal facilities, competition of electric roads, of water routes, and of Canadian railways, etc. Special rates are sometimes made for certain classes as an aid to freight development. The special equipment of limited trains, involving greater expense and permitting only a smaller number of passengers per car than is customary on ordinary trains, as well as the higher speed of these trains, justifies a higher charge. On the other hand, railways which reach the same points as other lines, but which offer inferior or slower service, are justified in demanding differential rates in order to tempt passengers to take their routes. The large and regular volume of certain local travel justifies lower charges to commuters. In fact, the conditions of railway travel in the leading geographical sections of the country, of which the witness enumerates 7, justify differences in railway charges by sections. Similar causes lead to the different conditions imposed upon and prices charged for commutation, excursion, mileage, and similar tickets. Differences in rates are as justifiable in this country as they are in foreign countries, where different classes of traffic are recognized. Nevertheless, there is a steady tendency to reduce the disparity in rates according to natural laws. Growth of population, further consolidation of railways, and other influences will tend to make fares steadily lower and more uniform, and legislation is not necessary nor helpful. (618-620.)

2. *Existing rates.*—The average passenger rate on the New York Central Railroad, according to Mr. CALLAWAY, is only 1.82 cents per mile. The company is allowed to charge only 2 cents on its main line, and its highest rate on the branch lines is 3 cents. Mileage books are issued at 2 cents, which are good on the branch lines. (329.)

On the Chesapeake and Ohio, Mr. INGALLS testifies, the local passenger rates are all based on 3 cents per mile, while the through rates average about 2 cents. On account of the sparse population, higher local rates are necessary, and even then local trains lose money. The average receipt from passengers on the Chesapeake and Ohio is a trifle over 2 cents per mile, and on the Cleveland, Cincinnati, Chicago and St. Louis a trifle under 2 cents. (292.)

According to Mr. SPENCER, of the Southern Railway, the somewhat higher passenger rates in the Southern States are necessary on account of the sparse population and the consequent small amount of passenger business. The average rate on the Southern Railway system, however, was only 24 cents in 1898. (275.)

Mr. MOUTON, vice-president of the Atchison, Topeka and Santa Fe Railway, declares that passenger rates in this country will average lower than those in any other country, and that the character of the service is better. The charges for sleeping cars especially are lower, and the cars superior. (490, 498.)

3. *Devices for stimulating traffic.*—Upon its being pointed out to Mr. COWEN, of the Baltimore and Ohio, that there is relatively less passenger travel in this

country than in Europe, he said that he thought the railways did everything possible to stimulate traffic. The practice of granting special rates to parties, which has finally been upheld by the courts, has built up a considerable traffic, especially by way of allowing theater companies to visit small towns. The use of mileage books accomplishes many of the results obtained by the "round-about" ticket and other passenger devices of European countries. (310.)

Mr. DICKINSON desires a general mileage book, good either over the whole United States or over large portions of the country. He admits that the difficulty in adjusting such a book without injustice either to the roads in mountainous and thinly settled regions or to the travelers in level and thickly settled regions would be considerable, but says that the railroads always seem to be able to surmount difficulties when they want to do so. It would not be necessary, however, that the mileage book be absolutely universal. The witness thinks that passengers can be carried in Wisconsin or Minnesota as cheaply as in New York or Ohio; and there would seem to be no difficulty in issuing mileage books which should be good at least over very large portions of the country. (555, 556.)

Professor JOHNSON believes that the American people, contrary to common opinion, do not travel as much relatively as those of Europe. We need cheaper service, cheaper sleeping-car accommodations, excursion rates, etc. The reduction of rates in Austria-Hungary in 1890 immediately caused great increase in travel. (61.)

4. *American and European passenger rates.*—(See also pp. 125 ff.—Mr. WEYL submitted the following table, comparing the passenger traffic of European countries with that in the United States. He points out on the basis of this table that in proportion to population the American people take a considerably smaller number of trips than the English or Germans, and even less than the French, Belgians, and Swiss. The average distance traveled per passenger is considerably greater in the United States, and the total number of miles traveled by all passengers is greater; although in proportion to the population the total number of miles traveled is only about as great as in Germany or France, and probably considerably less than in Great Britain. Our receipts per passenger are considerably higher than those of other countries, our fares averaging from three-fourths to 1½ cents. High fares in America are associated with comparatively empty trains. The comparison frequently made between fares on American railways and first-class fares on the Continent is unjust, since, as is seen by another table presented by the witness, the great mass of travel in Europe is in the third-class cars, while in Germany a considerable proportion is also in the fourth class. The proportion of third-class traffic is 90 per cent in Great Britain, and in the other countries ranges from 71 per cent in Italy to 92 per cent in Norway. (758, 759.)

| Country. | Year. | Number of passengers (in millions). | Number of passenger miles (in millions). | Number of passengers per head of population. | Number of passenger miles per head of population. | Average length of trip in miles. | Receipts per passenger. | Receipts per passenger per mile. | Number of passengers per train. | Revenue per passenger train mile. | Passenger density (passengers per mile of railroad). | Freight density (ton miles divided by miles of railroad) not tons. |
|---------------------|--------|-------------------------------------|--|--|---|----------------------------------|-------------------------|----------------------------------|---------------------------------|-----------------------------------|--|--|
| Germany..... | 1897-8 | 622.5 | 10,058 | 13.2 | 192 | 14.5 | 15.7 | 1.08 | 71 | 77 | 342,000 | 601,000 |

B. *Passes.*—Mr. KNAPP, chairman of the Interstate Commerce Commission, believes that the granting of free passes and special privileges to individuals in passenger traffic is a serious evil. In most cases the granting of such passes has some motive of self-interest, although the half rates granted to clergymen are apparently due to unselfish motives. Members of State and National Legislatures, judges, and public officers are quite regularly offered free transportation, although they do not always accept it. The law, where it prohibits the giving of passes to

such persons, is evaded in various ways. Thus they may ostensibly be granted for newspaper service, or be limited to transportation within a State where there is no law against it, although in practice accepted in other States.

The witness thinks that it is possible, as he has heard it claimed, that the actual revenues received by the railroads on their passenger business do not exceed 75 or 80 per cent of what they would be if the full published rates were paid by all passengers. Thus by the elimination of free transportation, as well as of the abuse of round-trip tickets by scalpers, the passenger rates throughout the country could be materially reduced. The granting of passes to employees of other railroads is also carried too far. (135, 136.)

Mr. PROUTY, another member of the Interstate Commerce Commission, does not consider the abuse of passes as serious as Mr. Knapp does, but suggests that an effective remedy would be secured by requiring the railroads to file with the Interstate Commerce Commission lists of all passes issued, to be open to public inspection. (152.)

Mr. REAGAN, chairman of the railroad commission of Texas, declares that free passes are not given for charitable purposes, but usually to public officers and other influential persons, or to large shippers as an inducement for freight traffic. The system involves the taxing of a part of the people for the benefit of a few. The Texas constitution contains a large number of exceptions to the provisions prohibiting discrimination between individuals, so that practically the railroad commission is unable to prevent the abuse of the pass system. (341, 342.)

Mr. WILSON, grand chief of the Brotherhood of Railroad Trackmen, and Mr. RONEMUS, grand chief of the Brotherhood of Railway Carmen, think that the issue of free transportation should be restricted to railway employees and Government employees in the Railway Mail Service, declaring that passes are issued largely for corrupt political purposes, and that favors are extended to men who can well afford to buy tickets. Mr. Ronemus thinks that a uniform rate of 1 cent per mile should be made to all railway employees and their families. (768, 771.)

Mr. INGALLS, of the Chesapeake and Ohio, thinks that the granting of passes is discrimination in favor of individuals, which should be considered a violation of law. There has been a great decrease in the practice during the past 10 or 15 years, but the witness presumes that it is still large. Passes on the Chesapeake and Ohio, and the Cleveland, Cincinnati, Chicago and St. Louis, are not, he thinks, more than one-tenth as numerous as they formerly were. A great majority of the railway managers are tired and sick of issuing passes.

It is still the practice on the railways represented by the witness to grant passes to members of State legislatures and of Congress, so far as they live on the line of the railroad, good for the session. Since it is an immemorial custom, this practice could not be discontinued without a law prohibiting it. Passes are not issued to judges or to officers of municipalities, although State officers are granted passes. Mr. Ingalls does not admit that any political influence is sought through the issue of passes.

The witness is in favor of absolutely prohibiting the granting of passes except, perhaps, to employees of the road itself. It creates a better feeling among employees to be somewhat liberal in granting passes to them and their families. The registration of passes with the Interstate Commerce Commission might have some beneficial effects, but the list would be so large that few people would ever look through it. (293-295.)

Mr. FISH, of the Illinois Central, believes that the evils of passes would have been largely prevented under the Interstate-commerce act but for the long list of exceptions allowed. The witness does not believe in giving something for nothing under any circumstances. If value is received from employees or others it should be paid in money and not by transportation. Mr. Fish has been told that sometimes there is value received from members of legislatures to whom passes are granted. He favors abolishing passes altogether, including special rates to clergymen. He does not think, however, that the loss of earnings through the issue of passes is significant. People who receive passes would not travel without them for the most part. (334, 335.)

Mr. SPENCER, president of the Southern Railway, thinks that the granting of passes constitutes an abuse throughout the entire country, although he hopes that it is less on the Southern Railway than on some others. He would like to see all passes prohibited by statute. Railroad men themselves should pay fare on other railroads at the expense of the railway employing them, if the journey be upon official business. (370.)

Mr. CALLAWAY, president of the New York Central, testifies that no passes are issued by that road except by Mr. Depew or by Mr. Callaway. He grants them practically only to railroad employees, and he does not think that the revenues

of the railroad are affected by these passes. They largely go to persons who would not travel otherwise. A New York law prohibits the granting of passes to public officers. (229.)

Mr. BIRD, general traffic manager of the Chicago, Milwaukee and St. Paul Railway, declares that the practice of issuing passes benefits the few at the expense of the many. Railroad companies themselves are trying to limit passes to their own employees or to the employees of other companies necessarily traveling on official business. In the latter case the issue is merely an exchange which evens itself up. The witness would consider it just to limit the use of passes by employees to travel on the company's business exclusively, but thinks that to try to do so would lead to corruption and excuses for traveling on the company's business. It is not practicable for the railways to abolish passes to public officers unless all do it; and legislation to assist them in the movement is very desirable. There is probably less of free transportation in the Northwestern States now than 5 or 6 years ago. On the Chicago, Milwaukee and St. Paul passes are issued, practically, only by the president. The witness does not think that the entire amount of free traffic would be more than about 1 per cent of the passenger earnings of the railroads. (468, 469.)

Mr. MORTON, vice-president of the Atchison, Topeka and Santa Fe Railway, declares that passes are given for personal, official, and commercial reasons, and in exchange for advertising, services, etc. In almost all cases the reasons for issuing them are bad ones. Even railroad officials or employees traveling on other lines should be required to pay fare. At a meeting of the executive officers of the Western, Northwestern, and Southwestern railroads in October, 1899, it was recommended that free transportation should be done away with except to railroad employees and greatly reduced in their case. These recommendations being submitted to the officers of 265 railroads representing 184,000 miles, practically all of the mileage of the country, favorable replies were received from 129 railroads representing 150,590 miles. (190.)

Mr. COWEN, of the Baltimore and Ohio, also thinks the pass system is abused, although he would not favor trying to prohibit it, unless it is used as a means of discrimination between shippers—a practice which has greatly decreased in recent years. The issue of passes to public officers is not in the nature of bribery, but has grown out of long custom from which it is impossible to break away. It is true that passes granted to prosecuting officers of counties are probably issued in consideration of the many offenses against railroads which these officers are called on to prosecute. The witness has heard it stated by a prominent railway officer in New York that the prohibition of passes to State officers has resulted in even more passes being granted, since officers now demand them for their friends and supporters, and the railways are not in a position to refuse.

Mr. Cowen does not think it possible to remedy this abuse by legislation, since the opinion of the people generally, and especially that of railway officers, is not ready to support such laws. The railways must work out relief from the practice themselves. In New England, where the railway business is largely monopolized, passes are probably not issued to such an extent as in other places. (310-313.)

Mr. BLANCHARD, late commissioner of the Joint Traffic Association, says that passes are sometimes issued to shippers in such a way as to constitute unjustifiable discrimination. Nevertheless, when a shipper is also a railway officer there is no reason why he should be refused a pass even if it helps him as against his competitor. Passes issued to persons accompanying live stock are necessary to secure proper care for the animals. Some passes issued to manufacturers may be wholly or partly compensated for in freight rates; the two things should be dissociated. Passes issued for charitable reasons are sometimes abused. Passes given in exchange for newspaper advertising are convenient to both sides and save the keeping of accounts. The witness would favor limiting passes of railway employees to those connected with the company itself and the members of their families. The unwarranted issue of passes to legislators and public officers can be most effectively checked by legislative action; but such passes are usually complimentary to public position and seldom have corrupt motives or influence. (620, 621, 669.)

Mr. STRICKNEY, president of the Chicago Great Western Railway Company, says that if there had never been passes granted it would be a good thing not to permit them, but to prohibit or stop issuing them now immediately might cause too much disturbance. He believes that Congressmen are not given passes by his road, nor the members of the judiciary of the States. Nevertheless, railroads often find that there are men to whom it is not to their interest to refuse passes if asked for. Legislation on the matter is probably not desirable. At any rate, whatever penalty is imposed must be small if there is any hope of enforcing it. (456, 457.)

Mr. DICKINSON testifies that his State, Wisconsin, has enacted an antipass law, applying only to public and State officials. From the fact that people who hold quasi-public positions have had passes he infers that the law has not been enforced. He does not know of anything to justify the giving of passes, except to railroad employees. He considers that railroads may properly favor their employees in this way, just as other business institutions are accustomed to grant favors to their employees which they do not grant to outsiders. Although mercantile houses do not often, perhaps, make presents to their employees, they do regularly sell goods to their employees at less than the regular price. This seems to be a courtesy of similar character to the grant of a pass by a railroad. The witness supposes that railroads grant passes to their employees of all grades, though doubtless more freely to the higher ranks. He understands that such passes are now limited for the most part to transportation over the line on which the man is employed. Although the railroad is in theory a public institution, it is also in part a private institution, and the granting of favors to its men is not so objectionable as the granting of favors by a purely governmental establishment would be. (552-554.)

Mr. Dickinson states that people often seem able to get free transportation who can not apparently be of any value to the railroad; at least people who are not in a position to furnish the railroads with any business. He thinks that newspaper men do not generally have passes in his region, but that their transportation is rather in the way of mileage. He notices that public men of various grades are likely to get them, and he mentions that a councilman in St. Joseph was able some time ago to accommodate him with transportation from St. Joseph into Nebraska and back. (554, 555.)

C. Ticket brokerage. 1. *Existence and character of evil.*—Mr. BLANCHARD, late commissioner of the Joint Traffic Association, declares that the practice of ticket brokerage reduces railway revenues. It forms the basis of many secret and fraudulent devices which result in unjustifiable discriminations in fares. Unauthorized persons secure the advantage of special rates granted to trade bodies, conventions, etc. Scalpers incite railroad wars in order to procure tickets.

The opportunities for ticket scalping are made very numerous by the practice of issuing, for the convenience of passengers, through tickets for long distances over various routes. Each railway offers tickets over a multiplicity of connections. For example, a ticket may be sold from Philadelphia by way of Buffalo, Cleveland, and Toledo, to Cincinnati, at a rate based upon a direct route to Cincinnati. The opportunity for using the various coupons for scalping is manifest. (621, 622.)

Mr. Blanchard also declares that railways often connive with ticket brokers. By furnishing them tickets at reduced rates a company is able to violate the law by cutting rates without due notice. This practice is less extensive than formerly. The witness refers to one instance when a new line was opened from Buffalo to New York, which disposed of perhaps 10,000 tickets directly to speculators. Afterwards a better understanding was reached between the competing roads and an offer was made to redeem these tickets at a profit to the scalpers, but they refused to return them. Even where railroads have not furnished tickets directly to scalpers they have sometimes referred passengers to brokers' offices as places where tickets, as the result of the ordinary practice of selling unused parts of tickets, could be secured more cheaply. These practices have been in part curtailed by the appointment of agents to visit scalping offices and "test the market."

Scalpers also secure tickets at times from conductors and from clerks and ticket distributors in the general offices. The witness cited one particular case where a chief ticket clerk was found to be getting three times his salary by selling tickets to brokers.

Scalpers often mislead buyers of tickets by false information as to routes, checking of baggage, sleeping cars, etc. Railway companies are ready to offer all necessary information correctly. (621-623, 666, 667.)

Mr. MOTTON, vice-president of the Atchison, Topeka and Santa Fe Railway, declares that ticket scalping is tolerated in no other country and should be abolished here. There should be national legislation on the subject for the sake both of the public and of the railroads. There is always more or less transportation furnished by dishonest employees of railroads to ticket brokers. Moreover, railroad companies often secretly assist the scalpers, although the business obtained in this way is less than that which the public gives to the brokers. Probably united action by the railroads would drive the brokers out of business. (489, 500.)

Mr. SPENCER, of the Southern Railway, declares that this practice is exceedingly injurious to the railways, and therefore prevents them from affording as great facilities to the public as they could otherwise. In fact, if the practice were abolished, the general tendency toward lowering passenger rates would

probably be somewhat accelerated. The sale of ~~unused~~ parts of tickets to scalpers is morally wrong. In the case of cheaper through tickets and return tickets there are legitimate reasons for granting lower rates. The ticket is bought with the supposed intention on the part of the buyer to use the entire ticket, and he is acting fraudulently if he stops off at an intermediate station or does not return, and sells his ticket. Railways themselves are usually entirely willing to prevent loss to a man who finds it impossible to complete his journey by refunding to him such a part of the money paid that the cost of his transportation to the point reached is the same that he would have paid if he had bought a ticket to that point originally. This is clearly all that the buyer can ask for.

The witness thinks, however, that one of the chief evils of ticket scalping is that certain railways themselves employ the ticket brokers to sell tickets at cut rates. They thus escape the necessity of publishing their true rates and giving the due notice of changes required by law, and their competitors are unable to act intelligently in meeting them. The railway which obeys the law is thus at a serious disadvantage.

In case scalpers' tickets are presented to a railway with its knowledge, it is the usual policy not to recognize them unless there is some danger that a court decision may be made against the railway for refusing. Railways would not especially object to transferring tickets if the same prices were received for the transportation. In case of injury to a person carried on a scalper's ticket, the railway would be apt to claim that it was bound by no liability. (269, 272.)

Mr. INGALLS, of the Chesapeake and Ohio, also considers this practice injurious. It constitutes a great temptation to conductors to dispose of tickets to brokers. On account of the abuse of round-trip tickets, the granting of special low rates for excursions is considerably checked. It would be in this special regard that the general public would be benefited by abolishing ticket brokerage, rather than in any general lowering of the rates. Ticket scalping cuts into the revenues of railways very largely.

Although a few years ago a number of railways made it a practice themselves to sell tickets to brokers, most of these have gone into bankruptcy, and the practice is apparently not common. There is complaint that the West Shore Railroad still sells tickets to brokers. The railways themselves, nevertheless, if they would all agree to limit their tickets to single trains, could immediately check the practice of ticket scalping. (293, 294.)

In the opinion of Mr. COWEN, of the Baltimore and Ohio, the practice of ticket brokerage has often been the cover for many illegitimate practices, although this is not necessarily true of the business of the brokers. The railways formerly employed brokers during rate wars, but to remove the connivance of the railways would not destroy the brokerage system. Although the prohibition of ticket scalping would probably not lower general rates, the witness believes that there are cases where special low rates can not be given for fear of this practice. (309, 310.)

Mr. FISH, of the Illinois Central, thinks that since the railways are prohibited from selling tickets for more than the advertised rates, they should be protected against sale below those rates by others. Although brokers do some honest business, they could not maintain themselves except by dishonest practices, such as altering the dates on tickets. To some extent railways doubtless connive with brokers by furnishing them tickets at cut rates. (333, 334.)

Mr. WILSON, grand chief of the Brotherhood of Railroad Trackmen, declares that ticket brokerage should be abolished on account of the unnecessary losses to railway earnings arising from the practice, which tend to reduce wages and to cause other evils. (768.)

2. *Justification of ticket brokerage.*—Mr. STICKNEY, president of the Chicago Great Western Railway, declares that, although his view is unpopular with railroad men, he sees no reason why a person who buys a through ticket and only uses part of it should not sell the unused part. When it is suggested that the ticket be redeemed by the company, the reply is that it is not easy to find the company's office or to make the arrangement. To punish a man for buying and selling the unused part of the ticket would be outrageous. The witness presumes, however, that the bulk of the business of the scalpers is given them directly by the railroads. At any rate, legislation in the matter is not desirable. (457.)

3. *Remedies.*—Practically all the witnesses, expressly or by implication, favor legislation prohibiting ticket brokerage. They mostly are willing to require railroads to redeem unused parts of tickets.

Mr. BLANCHARD declares that the railway companies are unable entirely to check the scalping of tickets. All the different means of identifying holders of tickets are evaded in various ways, some of which are specifically mentioned. The

railways are always willing to return to the holders of unused parts of tickets any amount not exceeding the fare which duly accrues for the distance actually traversed. In fact, passengers often sell unused tickets for less than the railways would pay, although Mr. Blanchard admits that they sometimes save money by selling their tickets. The railways have been seeking to reduce the opportunities for scalping by the sale of limited tickets at reduced fares. These tickets are good only on a single day, and can not well be sold.

The suggestion that ticket scalping be checked by requiring the name of every man who buys a ticket to be placed upon it is impracticable on account of the great rush of traffic at many ticket offices. The same difficulty confronts the proposition to have the selling price printed on the face of every ticket, with the proportion of the whole fare accruing on each coupon, and with the assurance that any coupon will be redeemed.

The witness is not certain as to the effect of the purchase of a scalped ticket upon the liability of the railroad for injury to a passenger. If there were distinct fraud, as by the signing of a false name, the railway should probably be exempt from liability.

Commenting on the decision of the court of appeals of New York, holding the antiscalping law unconstitutional on the ground that a ticket once bought becomes the property of the purchaser, to dispose of as he sees fit, Mr. Blanchard declares that the ticket is not the property of the purchaser, but of the carrier. It is simply an evidence of a contract of transportation, and the railroad has the right to demand its surrender when the contract has been fulfilled. The railroad, in fact, could take up the ticket when the train first started. Freight bills of lading must be surrendered to the railway when the goods are delivered. No one would think of authorizing the scalping of freight bills as the scalping of tickets is authorized. The whole system of ticket brokerage is, in the opinion of the witness, immoral and illegal. (622, 623, 666-671.)

Mr. Blanchard states that during the recent hearings before the committees of Congress on the antiscalping bill, practically all of the newspapers, mercantile associations, railway officers, and railway commissioners of the country were strongly in favor of the bill. Ticket brokerage was defended by not over 3 railroads, and was chiefly upheld by 560 brokers. There can be no doubt that the only proper officers to sell tickets are the duly chosen agents of railroads. (621.)

Mr. CALLAWAY, of the New York Central, thinks that this practice is one of the most demoralizing features of railway business. He declares that it has been abolished by law in nearly every country in the world except the United States, and that it is prohibited in Pennsylvania, Illinois, New Jersey, Montana, North Dakota, Minnesota, Texas, North Carolina, New York, Florida, and Indiana. One of the chief difficulties is that brokers deal largely in forged and stolen tickets. (227.)

Mr. BURD, of the Chicago, Milwaukee and St. Paul, says that the constant effort of the railroads to limit the use of through tickets at reduced rates has largely lowered the profits of ticket brokers, although there are special cases of such low through rates. Improved methods of regulating mileage books have also made it more difficult to transfer them through ticket brokers. Thus, in the Northwestern States, a "traveler's permit" is issued, by which the passenger pays always his local fare, but has the amount entered in a little book, and after traveling 2,000 miles, can get from the railway the difference between what he has paid and the special 2,000-mile rate. The only business of consequence left to the broker is that which is furnished by the railways themselves. The original practice of allowing brokers reasonable commissions for selling tickets in times of rate wars was not especially injurious, but in many cases the commissions offered are so great that the brokers can profitably sell tickets at less than the open rates. The railroads are generally in a position to stop this practice. The strongest lines in a group are forced to follow the practices adopted by the worst and weakest lines. The witness believes that legislation by Congress and the States on the subject is desirable. (469.)

Mr. REAGAN, of the Texas Railroad Commission, believes that it should be made a penal offense to engage in the business of ticket scalping, and perhaps even for the purchaser of a single ticket to sell it to another person. In that case the law, like that in Texas, should provide that the purchaser who does not use a ticket can have it redeemed by the railway. Ticket scalping enables railroads themselves to underbid each other and make discriminations, and leads to many frauds. (350.)

Mr. FISH thinks that if statutes should require that every ticket should be stamped with the price at which it is sold, and that an unused coupon should be redeemable within 30 days by railways, the practice of ticket scalping would

be destroyed. He does not think that it would be desirable to compel railways to redeem small parts of tickets or coupons. (333, 334.)

Professor JOHNSON believes that the practice of ticket brokerage should be done away by law. The railways are unable to do this alone, especially because some roads are always sure to refuse to cooperate. In fact, the system is often employed as a device for cutting rates in order to get business, the cuts being concealed in this way. The losses which railways suffer by ticket brokerage undoubtedly tend to reduce wages. (60, 61.)

Mr. SARGENT, grand master of the Brotherhood of Locomotive Firemen, says that this practice offers a convenient way for evading the law and making discriminations. Losses caused by it must be made up at the expense of someone. Those who live in large places secure an advantage over others. Many brokers resort to fraudulent and criminal methods—forgery, counterfeiting, and misrepresentation. Employees are enticed to defraud the company and altercations with passengers are caused. Counterfeit cards of membership in railway brotherhoods have been sold by brokers. (70.)

Mr. WILSON, grand chief of the Brotherhood of Railway Trackmen, has found from his own experience that tickets for any considerable distance can always be bought from scalpers for less than the regular fare. Such tickets have no signature, and he has known them to be bought by scalpers directly from agents who have quoted higher rates just before. He believes this practice, by reducing railway profits, tends to keep down wages. (46, 53.)

Mr. VANLANDINGHAM favors a law prohibiting ticket scalping. (214.)

IX. GENERAL LEGISLATION CONCERNING RAILWAYS.

A. Principles of legislation generally.—1. *Public character of railways.*—The members of the Interstate Commerce Commission who testified before the Industrial Commission were unanimous in their opinion that control over railway rates and over pooling agreements, as well as the requirement of publicity of railway affairs, is thoroughly justified by the public character of railway services. Mr. KNAPP declares that various practices, discriminations, etc., among railways might perhaps be justified if only the private financial interests of the railways were to be considered. But where the public interest is concerned such practices must cease. The impossibility of effective competition among railways, together with the absolute necessity of their services, renders them public agencies. The passenger makes use of the railway rather by virtue of his political rights than by contract. The passenger ticket is more in the nature of a tax receipt than evidence of a bargain. Mr. CLEMENTS also insists that if the public has any rights at all with regard to railways it has absolute right to inspect and control them, subject only to the limitation that property shall not be confiscated or taken without due process of law. (Knapp, 135, 139, 140; Clements, 159.)

Other witnesses often refer incidentally to the public character of railways as justifying various regulations.

2. *Claim of railways to fair treatment.*—Mr. BLANCHARD, late commissioner of the Joint Traffic Association, says that cities, States, and the General Government at first granted all sorts of privileges and advantages to railways, but that afterwards the attitude of the public changed to one of opposition. Most of the railways first constructed sought to connect important objective points. Their local traffic was inadequate, and they had to wait for a long time before the slow development of the territory traversed made them profitable. Many of the roads defaulted in their interest payments and were reorganized. There has been a steady decrease in charges and a steady improvement in service; but in spite of that fact public appreciation of the railway service has lessened, and legislators have been inclined to increase restrictions of all sorts. The railways have sought to obtain legitimate protection in exchange for their services and in view of the restrictions placed upon them, but they are met with constant opposition. (624, 625.)

Mr. INGALLS, president of the Chesapeake and Ohio, declares that three interests must be considered in attempting regulation: (1) The property must be kept up in satisfactory condition so that passengers can be carried with safety and dispatch and the freight handled regularly and promptly. (2) The employees must be paid promptly and fairly and their interests protected. If the revenues are insufficient to pay fair wages, the character of the service is injured and safety and proper transportation lessened. (3) Patrons must be served at a cost as reasonable as is consistent with the previous requirements and with a fair return to the investors on their property.

When railways were first established the investment was a hazardous one;

securities were issued with little regard to values, and in many cases were afterwards wiped out by foreclosure. The new owners of the reorganized companies endeavored to earn an income in any possible way. This caused public dissatisfaction, and the courts finally held that the railways were public servants, subject to control over their rates, provided a fair revenue be left for the capital invested. Many States appointed commissions, and some endeavored to fix charges absolutely by law. The latter practice has been largely abandoned as unsatisfactory.

Mr. Ingalls believes that the public character of railways thoroughly justifies any necessary regulation. They are quasi-public corporations and should be managed to the satisfaction of the people, and especially with their thorough knowledge. But the chief legislation which the witness considers necessary is the legalization of pooling in order to prevent the existing rate cutting and discriminations. (285, 286, 297.)

Mr. RIPLEY, president of the Atchison, Topeka, and Santa Fe Railroad Company, says that the railroads are entitled, in all fairness and justice, to ask that one of the following courses be pursued:

1. Remove the restrictions and turn the roads loose.
2. Accord them that protection to which they are justly entitled.
3. Buy them.

If a railroad is a private corporation solely, the Government has no right to interfere with its business; if it is a public or a quasi-public institution, the Government ought to protect its interests. The attitude of the American people toward the railroads is grossly unfair and even dishonest. The railroads have restrictions without protection. (591, 595.)

Mr. Ripley says that the state has not assumed in this country to regulate the price of any commodity except railroad transportation. If the revenues of a private corporation are limited by law the state owes that corporation protection. That is, the Government has no right, while it limits the charges of the railroads, at the same time to forbid them to adopt reasonable methods for maintaining fair rates. Nothing more than the opportunity to maintain fair and reasonable rates has ever been asked by the roads. The roads might well ask for more than the mere permission to pool—for instance, laws prohibiting the building of unnecessary roads and confining each existing line in the sole occupancy of its territory. (594.)

B. Working of interstate-commerce act. Mr. BLANCHARD declares that the interstate-commerce act has been effective in protecting the public and has been unjust to railways. He attributes its chief failure to the prohibition of pooling. The exclusion of the water carriers from the application of the law has been unfair to the railways. The law did not foster harmony between the Government officers and the carriers. It has failed to prevent discriminations, in spite of its severe penalties, because, preventing pooling, it has not enlisted the interests of the carriers. Nevertheless, the act has been beneficial in securing greater publicity of rates, in checking open rate wars, in more fairly adjusting long and short haul rates, and in its educational effect upon the railways and public opinion. (657, 658.)

Mr. SPENCER thinks that the commission has already accomplished much good in requiring publicity of rates, in systematizing accounts and records, and, to a less extent, in prosecuting violations of the law. Its powers in this last regard should be increased. (282, 283.)

Mr. CALLAWAY, president of the New York Central, says that almost invariably his own road complies with the orders of the Interstate Commerce Commission, and he believes that most railways do the same. The commission, in fact, usually agrees with the position taken, at least by his own railway. If not, publicity and the influence of public opinion are enough to enforce the commission's orders. (236, 237.)

Mr. COWEN, of the Baltimore and Ohio, declares that as a matter of fact there are very few complaints as to the reasonableness of rates. Most shippers are powerful enough to look after their own interests. The chief value, moreover, of a commission like the Interstate Commerce Commission is that it brings public opinion to bear upon the railways. Most of the important work of the commission is done without technical litigation. In 95 cases out of 100 the railways comply with suggestions of the commission. (314, 315.)

Mr. SARGENT, grand master of the Brotherhood of Locomotive Firemen, says that as yet the Interstate Commerce Commission has scarcely possessed power to accomplish anything except to collect statistics. It has had a beneficial moral effect, but should be given much greater power. In this way its services might become of great value to the country, the railroads, and the employees. The witness would not favor, however, giving the commission power to settle disputes between employees and railways. (94.)

Mr. KINDEL, a manufacturer, of Denver, thinks that the interstate-commerce act at present is a mere farce. The long and short haul feature seems to him the most important part of the law, and this is practically not carried out at all. The witness thinks that the amendments proposed in the Cullom bill, in the Fifty-fifth Congress, would meet the needs of the case for the most part. (261.)

Other opinions as to the working of the present act appear in connection with arguments as to proposed changes.

C. General amendments proposed to interstate-commerce act.—Mr. VANLANDINGHAM, commissioner of the St. Louis traffic bureau, recommends the following changes in the act to regulate commerce:

1. The findings of the Interstate Commerce Commission should be binding within 30 days and enforceable at law unless upon appeal to the courts they are found to be unjust. The commission should not have the authority to fix rates generally, but should be authorized to order reduction of rates found to be exorbitant, and to determine the relation of rates as between localities and commodities.

2. Absolute publicity should be required regarding all rates or regulations affecting transportation, whether in domestic or export and import traffic. The railways at present hold that they are not required to publish their export rates. Railways should also be required to furnish to shippers, boards of trade, etc., on request, copies of all tariffs that affect such shippers or members of such organizations, whether such tariffs apply directly to the locality or to rival localities. At present men who are not posted do not know how to get information as to tariffs.

3. All traffic moving by rail, or partly by rail and partly by water, including export and import traffic, should be subject to the interstate-commerce act, the proportion of rates accruing to the inland carrier being subject to the same control as purely domestic traffic.

4. Railways should be prohibited from making lower rates on grain to the seaboard for export than on flour or grain products for export.

5. The penalty of imprisonment against persons who pay or accept less than the published tariff rates, except shippers who obtain lower rates by fraudulent misrepresentation, should be repealed. The purpose of this is to secure testimony. Moreover, the imprisonment clause, as regards officers and agents of railroads, should be abolished, since railway men will not furnish testimony against others so long as it remains. There should be substituted fines against the companies themselves primarily, and also against their officers, those against the companies being not less than \$5,000, or double the revenue received by the company at unlawful rates, where this is greater than \$5,000.

6. Railways should be permitted to agree upon reasonable rates and to maintain voluntary associations for the maintenance and promulgation of such rates, the compilation of statistics, and the transaction of other joint work. On the other hand, pooling is not necessary or desirable. Agreements of this nature should be filed with the Interstate Commerce Commission and subject to its control.

7. There should be no change requiring longer notice as to reduction or advance in tariffs than is required at present.

8. Ticket scalping should be prohibited.

9. The Interstate Commerce Commission should be required to render its decisions not later than 90 days after the close of testimony, unless longer time is given by mutual consent.

10. If it were possible to require the various States to repeal all laws in conflict with the act to regulate commerce, and to adopt it as law for intrastate business, or if it were possible to transfer the entire control of commerce to the Federal Government, such changes would be desirable. (212-214.)

Mr. BLANCHARD, while opposing most of the suggested extensions of the power of the Interstate Commerce Commission, is willing somewhat to increase its prerogatives. He thinks that proposed amendments to the act should be made only after conference between the various interests involved. Railways should be consulted as well as shippers and the general public. The public certainly has an interest in railway affairs which justifies regulation, but the rights of railways should also be protected. The work of the commission has hitherto been very beneficial, especially by correcting misunderstandings on the part of both the railways and the public, increasing knowledge on both sides. The railways have usually been inclined to follow the suggestions made. The requirement of a uniform system of accounts has doubtless been beneficial. An amendment to the law should provide for more frequent conferences between the Interstate Commerce Commission and the railways, in which perhaps interested shippers might also participate.

The commission should be enlarged to seven members, especially in view of the increased railway business of the country. Some, at least, of these members

should be railway men. It is as absurd to constitute a railway commission with a provision that no member shall own a share of railway stock as it would be to exclude army officers from membership in a committee concerning coast defenses. The interests and the opinions of the railways would thus be brought into touch with the commission. It would be possible to find railway officers who would be impartial. The people trust their Senators and Representatives to legislate concerning industrial interests and do not prohibit them from holding stocks or acting as officers of corporations.

The Interstate Commerce Commission should provide for greater publicity by issuing at least every month a bulletin stating all the complaints coming before it. These statements should be in impersonal form, naming only the points and rates complained of, and not naming the railways or the complainants. This would have a very desirable effect upon public opinion and would tend to make the railways more conservative and careful in conforming to law. (664, 665, 678, 679.)

Messrs. PROUTY and CLEMENTS, of the Interstate Commerce Commission, agree in believing that its power should be increased if effective regulation of railway rates is to be secured. Especially if the railways are to be given the right to pool, the commission or some similar authority must be given thorough control over pooling contracts. Inspection of books by representatives of the commission is especially advocated, as well as the power to fix through rates, which is now entirely denied. (159, 155, 158, 161.)

Mr. GALLAGHER would provide uniform classification, with Government supervision, in the belief that it would do away with rate cutting in many cases where classification is now changed to produce a cut rate. He would have the Interstate Commerce Commission empowered to enforce its rulings, the rulings to stand until reversed by the courts. He would introduce Government inspection of railroad accounts, bringing the records of the roads under the supervision of the Treasury Department, if necessary, by means of an internal-revenue tax, which the shipper, if necessary, might pay. He would punish infractions of the law with fines, and not with imprisonment; he thinks we should get conviction quicker by releasing the shipper, unless he can be shown to be a party to the fraud. He is not clear whether the words "under substantially similar circumstances and conditions" should be eliminated from the long and short haul clause. (547.)

Mr. Dickinson would permit the railroad companies to make rates in the first instance, but would give the Interstate Commerce Commission authority to revise rates, and to enforce their decisions. He would also have the books of railroad companies examined by Government examiners. Mr. Dickinson was formerly of opinion that unrestricted competition would give the best railroad service, but has been forced to the conclusion that the railroads should be placed under governmental control. He believes that there is a strong and growing sentiment in his State, Wisconsin, in favor of Government control and of the increase of the powers of the Interstate Commerce Commission. He has been compelled to conclude that there is no other remedy for the existing troubles in transportation, and that the railroads themselves, as well as the public, would be benefited by a control outside of themselves. (549, 552.)

Business within States.—Mr. MORROW declares that Federal regulation of railways can never be entirely satisfactory until Congress has power to regulate business within the States, as well as interstate traffic. Rates within the State are intimately related to the interstate rates. For instance, rates from St. Louis to Kansas City, entirely within Missouri, are and must be on the basis of rates from Chicago to Kansas City. Discriminations in favor of individuals are often made on shipments within a State, there being no law against them, and this affects interstate traffic also. Many shipments entirely within a State are really only the beginning of shipments of an interstate nature. State railroad commissions often take action which practically nullifies orders issued by the Interstate Commerce Commission. Thus, in Texas particularly, the State commission is inclined to regulate rates so as to confine business as far as possible to the State and its citizens; "they are States' rights people." In Iowa and Nebraska somewhat the same tendency exists. The witness would be inclined to favor a constitutional amendment giving Congress power over all railroad business. (492, 501, 502.)

Telegraph and express companies.—Mr. PROUTY, of the Interstate Commerce Commission, sees no reason why express companies could not be subject to the control of the Interstate Commerce Commission, although he believes there are few complaints against them. The control of telegraph companies, he thinks, would more appropriately be given to the Post-Office Department. (152.)

D. **Proposal to give final power over rates to Interstate Commerce Commission.**—This proposition takes the form of giving the commission power either to fix all rates finally in the first instance, or to fix them on complaint, without appeal. The two forms can not always be distinguished in the discussions.

1. *Advocated.*—Mr. REAGAN, chairman of the railroad commission of Texas, believes that the Interstate Commerce Commission should be empowered to make and maintain freight and passenger rates as regards interstate and foreign commerce, and that the States should similarly regulate State traffic. He considers this entirely practicable, even with the present number of employees of the Interstate Commerce Commission, in view of the experience of the Texas railroad commission. The decisions of the commission should be subject to appeal to the courts on questions of law only, not on questions of fact.

Mr. Reagan also believes that to give the Interstate Commerce Commission power to reduce rates, even if it could not fix them generally, would go far toward remedying existing evils. He believes also that the commission has the necessary technical knowledge. The Texas railroad commission exercises absolute control as regards shipments within the State, shipments from without the State to points within the State being out of its jurisdiction. In deciding as to the justice of rates the Texas commission is forced for the most part to consider only the earning capacity and expenses of the railroads as regards their State traffic. Many considerations affecting the profits and character of the business must necessarily be disregarded on account of the excessive complexity and detail. There is, in fact, no science in rate making. Rates must be on the basis of experience from day to day. Uniform rates on all classes of goods, for example, are out of the question. In fact, it is not necessary to consider all theoretical conditions affecting railway traffic, but the actual working of rates can be studied by experience. Nevertheless, the reports of the Texas railroad commission do show statistically many of the controlling influences entering into the cost of transportation, and questions growing out of competition are also considered in fixing rates. (339, 345, 346.)

Mr. WOFFENDIN, chairman of the Chicago East-Bound Freight Committee, thinks that a reasonable rate fixed by the Government might benefit the strong roads and protect them against weaker roads who might be undertaking to reduce their proportionate expense of operation by cutting rates and so increasing their tonnage. He sees no objection to governmental fixing of rates, provided the rate is made with due regard to the rights of the roads as well as to the interest of the public. He has no reason to suppose that the action of Congress would not be reasonable on both sides, and he has every reason to believe that if the facts were properly placed before a board like the Interstate Commerce Commission their action would be reasonable. His experience is that the commission has always been patient in hearing both sides. He thinks the reputable roads would be glad of anything that would insure them stable, and at the same time reasonable, rates. There would have to be some power to arbitrate between the roads and the public, and he does not see why the Interstate Commerce Commission should not be as able to make a proper decision as any other body. (566, 567.)

Mr. CLEMENTS, of the Interstate Commerce Commission, is doubtful whether it would be practicable for the commission to have absolute responsibility for establishing freight rates throughout the entire country, but a body of experts could be appointed temporarily to revise existing tariffs and classifications with very beneficial results. The rates then established could be revised and corrected from time to time on the basis of experience.

The Interstate Commerce Commission ought to have power not simply to decide that a particular rate is unjust, but to prescribe a rate which shall be in force until conditions change. The commission formerly held that it had such authority to fix rates for the future, and frequently did so; but the courts afterwards decided that it had no such authority. Virtually the commission has been deprived of almost all the power which it was originally intended to possess. (155, 158, 161.)

Mr. KENNARD, of the Chicago Butter and Egg Board, thinks that many existing difficulties concerning freight rates and classification would be remedied by giving the Interstate Commerce Commission power to revise tariffs. The witness thinks that the action of the railways in making classifications, especially, is exceedingly arbitrary. (367.)

Mr. WILSON, grand chief of the Brotherhood of Railroad Trackmen, and Mr. ROMENS, grand chief of the Brotherhood of Railway Carmen, think that the Interstate Commerce Commission should be given power to determine freight and passenger rates on all interstate roads. It should consider the actual investment

in the roads and should fix the rates high enough to let reasonable wages and other expenses be paid and a reasonable dividend be earned. (767, 771.)

2. *Depreciated or criticised.*—Mr. BLANCHARD, late commissioner of the Joint Traffic Association, opposes strongly the proposed extensions of the powers of the Interstate Commerce Commission. He declares that the proposal that it shall fix rates, either directly, in the first instance, or by revising and changing them with conclusive authority, is a proposal to place legislative powers in the hands of the commission, and that it should not possess at the same time legislative, judicial, and administrative powers. The enormous complexity of rate problems makes it out of the question for a small body of unskilled men to determine them. Review by the courts would be insufficient protection to the railways. In fact, the only case where the courts would be inclined to overturn the findings of the commission would be where the railway was shown to be operating at a loss, and thus deprived of its property without due process of law.

The system in England, which is often appealed to as justifying added powers for the Interstate Commerce Commission, really gives the railway and canal commission only judicial powers to act in case of complaint. So far as rates are fixed by Government they are fixed by act of Parliament, and the procedure is very careful. The carriers are required to transmit to the board of trade—an entirely different body from the railway and canal commission—their classifications and schedules of rates. The board must hear all parties, and then, if it agrees with the railways as to the proposed schedules, or if it frames others for itself, embraces them in a "provisional order" to be transmitted to Parliament as a bill. In Parliament, if there be any objections to the bill, it is carefully considered by a select committee, and the rates only become binding after adoption by Parliament. The power to fix rates is certainly a legislative one, and it is entirely out of harmony with our principle of the division of powers to give that authority to an administrative body like the Interstate Commerce Commission, especially if it be also given judicial power to enforce the law.

The claim that if the commission were given power to fix rates it would merely act in case of complaint in changing and revising the rates, is scarcely upheld by the previous attempted acts of the commission. At present it has, under the law, no power to make rates at all, and yet it at one time attempted to fix the rates on all classes of commodities from Chicago and Cincinnati to points in four Southern States, virtually affecting all the rates to the South. The power to change a rate is virtually the power to fix rates. (661-665, 675.)

Mr. RIPLEY, president of the Atchison, Topeka and Santa Fe Railroad Company, says that it would be better for the railroads if all rates were enforced as published, but it would not be practicable to intrust the fixing of rates to any governmental body. Conditions vary so rapidly that there must be a certain amount of elasticity in the rates. The business is a sensitive one, and the same reasons exist for quick action in the changing of rates that exist in the selling of merchandise. Changes should be made honestly and publicly. It would not be possible, however, to intrust the matter to anybody many miles away. The Interstate Commerce Commission might have power to pass on the rate after it is fixed. At any rate, that would be better than the conditions we have now. It is a power that might be subject to very great abuse, and it is a larger power than is wielded by the President, or anybody in the United States. (596, 597.)

Mr. MORRIS, vice-president of the Atchison, Topeka and Santa Fe Railway, declares that he is not in favor of letting the Government fix the maximum and minimum rates for railways unless it at the same time fixes the prices of railway supplies, wages, and other elements of cost. He is willing that the Interstate Commerce Commission should revise rates on complaint, and apparently that its decision should stand until reversed by the courts. He thinks that the recommendations of the Interstate Commerce Commission generally have been wise and beneficial, both to the public and to the railroads, and that the railroads have usually followed its suggestions. The commission should have power to declare rates unreasonably low as well as unreasonably high. A low rate is often made for the purpose of diverting business illegitimately, to the injury of some particular industry or locality. One of greatest difficulties met by railroads is to fix justly the relative rates from competing markets. There should be some tribunal, such as the Interstate Commerce Commission, with final power to settle disputes as to differentials and similar questions. (492, 495, 496.)

Mr. SPENCER does not think that the Interstate Commerce Commission would be able to adjust railway rates throughout the United States. The problem is too large. Rates can not be fixed arbitrarily, but must be determined by experience on the basis of the constant friction of commerce and competition, which only the railway officers can understand. (282.)

Mr. COWEN, of the Baltimore and Ohio, says it would be impracticable on account of the magnitude and complexity of the task for five men to fix rates generally for all traffic. (314, 315.)

Mr. NEWCOMB, of the Department of Agriculture, would favor increasing the power of the Interstate Commerce Commission to regulate rates, but he believes that in each case careful investigation should be made, since many causes affect the justice of rates. Blanket orders covering a large number of rates and topics should be avoided. (99.)

Mr. CALLAWAY, of the New York Central, would be willing to give the commission supervisory power over pooling contracts, and with the commission as now constituted would be willing to submit to it questions as to the relativity of rates between commodities and localities. But it would be impossible for the commission to fix rates generally, the matter is so complex and the country so large. Nor would it be entirely safe to give the commission absolute power to reduce rates fixed by railways. Railways must sell their transportation to the best advantage, and the difficulties of securing entirely just rates are very great. The witness admits, however, the possession of public franchises by the railways and their quasi-public character, and declares that the railways are willing to accept reasonable regulations. He does not think railways would object if the decisions of the Interstate Commerce Commission should go into immediate effect until overruled by the courts on appeal. (236, 237, 239.)

Mr. BRID, of the Chicago, Milwaukee and St. Paul, thinks that the Interstate Commerce Commission should have greater power. At any rate, when its decisions are appealed to the courts, the trial should be on the basis of the testimony before the commission, unless some new issue has been raised. But to give the commission general power to make rates would defeat itself. It would be entirely incompetent to handle such an enormous task. (179.)

Mr. KELLEY, freight commissioner of the Trades League of Philadelphia, is of the opinion that the powers of the Interstate Commerce Commission should be enlarged by giving it control of the classification of freight, of pooling, and of rates. He would not allow it absolutely to fix rates, but would limit its power to that of revision; but if the commission declares rates or pooling contracts unreasonable, they should not go into force until upheld by a judicial body. The membership and opinions of the commission are constantly changing, and although they have greater technical knowledge than the courts, it would be unsafe to make their decision final. (190-192.)

Mr. CARTER thinks that the railroad company should be permitted to arrange its rates, subject to reasonable restrictions. They should be fairly remunerative. They should be such that all shippers over the line might have the advantages that the largest businesses have to-day. The great trouble to-day is the preferences that are given. The Interstate Commerce Commission should have the power of revising rates. (585.)

E. Proposal to make orders of Commission binding pending appeal.—*Advocated.*—It is the opinion of many witnesses that the Interstate Commerce Commission should be given power to enforce its own orders, and that they should be operative pending appeal to the courts. This is especially urged by members of the commission itself.

Mr. CLEMENTS, in particular, urges that the decisions of the Interstate Commerce Commission should be operative and binding until reversed by some court of higher authority. At present the railways can simply disregard any action of the commission, and the burden is upon the commission to bring suit and have its order enforced by the courts. The matter is taken up practically *de novo* in the Federal circuit court, and may then be appealed to the circuit court of appeals, and thence to the Supreme Court. In the meantime three or five or seven years may have passed, while the rates complained of have been in daily continuous operation, and the evil effects, for which immediate remedy was desired, have been continuing. Often, in fact, by the time a decision is rendered it is no longer of any use. Nor is the possibility of obtaining damages for the injury which has occurred by any means a sufficient remedy. (155, 156, 158, 161.)

Mr. MOSELEY, secretary of the Interstate Commerce Commission, declares that experience has shown the need of further powers to secure effective administration of the interstate-commerce act. The act requires that all rates shall be reasonable and just, but the Supreme Court in 1897 decided that the commission was not authorized to prescribe rates for future observance, but only to condemn rates already existing and complained of. As a matter of fact, no one has recovered a cent from the carriers on account of unreasonable rates, because of the large expense of litigation and because a person who pays excessive rates often shifts the burden on the consumer, and has little motive to bring suit. If carriers fail to

comply with orders of the commission suit must be brought, and the average time necessary to secure a final decision by the Supreme Court has been 4 years. In the case of discrimination it is held that the railway can not be prosecuted unless someone has paid the higher rate. The published rates may be so high that no one ever uses them, as was the case with the rates on cattle on the Atchison, Topeka and Santa Fe, where the shipping was entirely controlled by a monopoly. The commission should be authorized to make its orders as to rates effective until the carrier shows them to be unlawful before a court. (41, 43.)

Mr. NEWCOMB, of the division of statistics, Department of Agriculture, thinks the law should be amended so as to give practical finality to the orders of the Interstate Commerce Commission. At present, where railways refuse to obey orders, the commission is forced to carry the matter to the courts, which maintain that they have a right to hear the case practically as a new one, so that it is almost impossible to get the commission's decrees enforced. The courts are not experts, as the commissioners are, in matters of transportation. The power of the commission over freight rates should be final, although it should be exercised with great care. The courts might perhaps be allowed to refer matters back to the commission for further consideration. (103, 104.)

Mr. BACON, a member of the Milwaukee Board of Trade, says that he took an active part in the enactment of the interstate-commerce law and has watched its working. He thinks that the powers of the Interstate Commerce Commission should be strengthened. It should be permitted to revise rates in particular cases and its orders should go into effect pending appeal to the courts, since otherwise the railways, as at present, could delay cases almost indefinitely. The courts should pass only upon the law and not on the facts, since the commission, being an expert body, is better able to judge these. There would be no danger of ultimate injustice of the orders, since rates which are practically confiscatory are held unconstitutional by the Supreme Court. The injury to the railroads pending a decision would be much less than that to the public when unjust rates are continued pending a decision. The practice of fixing maximum and minimum rates to be applied in general sections all over the entire country is not desirable, on account of the differences in conditions in different cases. (419-423.)

Mr. SAGER, of the Northern Milling Company, Chicago, says that the millers generally favor giving the Interstate Commerce Commission power to effectively carry out its orders, especially with a view to protecting the milling industry against existing discriminations. (450, 454.)

Mr. VANLANDINGHAM, of the St. Louis Traffic Bureau, declares that if officers of freight bureaus and large shippers find it impossible to get redress of grievances from railway companies themselves they seldom appeal to the Interstate Commerce Commission, since it is practically powerless to remedy existing evils. He recommends the granting of power to the commission to enforce its decisions unless on appeal to the courts they be proved unjust, although he would not give the commission power to fix rates generally, but only to act on complaints. (212.)

Mr. DOUSMAN, a grain shipper of Chicago, believes there should be a uniform classification established by the Interstate Commerce Commission, and rates should be allowed to vary in different sections upon the same classification, subject to revision by the Interstate Commerce Commission. The commission's decision should be subject to review by the courts, but should be operative until proved unjust. The power of injunction should, if possible, be taken from the courts as regards rates fixed by the commission. Delay would not necessarily result from this, since the courts can decide emergency and constitutional cases quickly. The Interstate Commerce Commission might also be allowed to fix maximum and minimum rates generally. The witness is not an advocate of low rates simply. The business community can not get proper service unless the railroads make money. Moreover, good railroads need to be protected against undue rate cutting by poor ones, and to this end the witness favors allowing the railroads to pool with proper supervision by the Interstate Commerce Commission. (358-361.)

Mr. MALLORY, chairman of the railroad committee of the Chicago Live Stock Exchange, considers that the interstate-commerce law is defective, particularly in that the commission lacks the power to enforce its findings. He cites the experience of the Chicago live stock men in their efforts to secure the removal of the terminal charge of \$2 per car on live stock at Chicago. This charge was imposed 5½ years before Mr. Mallory's testimony. It had been declared to be unreasonable and illegal by the Illinois board of railroad commissioners, by the United States court at Chicago (though this decision was reversed by the court of pleas on a technical point), and then by the Interstate Commerce Commission. When Mr. Mallory testified the matter was still in the United States courts.

Some method of prompt redress and of preventing arbitrary action by the roads is urgently needed. (587, 588.)

Mr. BAKER states that he is entirely in accord with Mr. Mallory's views as to the need of strengthening the interstate-commerce act so as to give a prompt and effective remedy for unjust and arbitrary action of the railroads. He believes that the same views are practically universal among men in the live-stock business. As representative of the National Live Stock Association, he participated in the recent meeting looking to action for securing legislation in this direction. He believes that the bill which his association supports provides for public inspection of railway accounts. (592.)

Mr. BARRY, secretary of the Millers' National Association, is also of opinion that the Interstate Commerce Commission should be given authority to make its orders mandatory until reversed by some court. Although some of the investigations of the commission have had a beneficial effect, it is at present able to accomplish little. The millers generally favor the Cullom bill as introduced in the Fifty-fifth Congress, and commercial organizations and farmers are generally in favor of some such measure. The witness does not think that many of the railways would strongly oppose such a change in the law, although some few of them would do so.

This witness likewise refers to the disadvantage of the present arrangement by which the person injured or the Interstate Commerce Commission must appeal to the courts to enforce the order of the commission, the case being taken up de novo by the courts. (216, 247, 250.)

Mr. CARTER, a commission merchant, considers that every finding of the Interstate Commerce Commission should go into effect at once and that any rate fixed by it should stand pending appeal. (585.)

Mr. MUSSELMAN, president of the Grand Rapids Board of Trade, feels that to make complaint of any abuse to the Interstate Commerce Commission, with its lack of power to enforce compliance with its orders, would be a waste of energy. He desires that the powers of the commission be enlarged and that it be enabled to make its orders mandatory and operative. He believes that if the commission had such power many unjust discriminations would be speedily remedied and the people's interest would be better guarded. (557.)

Mr. STONE would give the Interstate Commerce Commission the power to fix a reasonable rate, after a hearing, and make its order effective pending an appeal. He would also give the commission power to examine the accounts of railroads as the accounts of national banks are now examined. (537, 538.)

Mr. INGALLS, president of the Chesapeake and Ohio, declares that he does not think that 5 independent men like the members of the Interstate Commerce Commission would be likely to make rates especially unfair to railways. They could not make rates so bad as some of the railway managers themselves if they tried. But to fix general tariffs would be beyond their power. The work is very extensive and very difficult, and tariffs must be changed continually. The witness would be willing that the commission should determine as to the existence of discriminations between localities and shippers, or should decide special cases as to the reasonableness of rates. Its decision could remain in force until overruled by the courts. The decision of the commission as to rates underpooling agreements might be final. (299, 300.)

Mr. COWEN, of the Baltimore and Ohio, would also be willing to give the Interstate Commerce Commission power to decide in any litigated case whether a given rate was reasonable or unreasonable, the decision to remain in force pending appeal to the courts. He thinks that most railway men, however, do not agree in this opinion. It is generally opposed by the Southern and Northwestern lines and by the New England roads, while the roads in the interior sections are divided in opinion. (314, 315.)

3. *Depreciated.*—Mr. BLANCHARD thinks that the demand of the commission that its orders should go into effect until declared unlawful by the courts, unless on the very face of the record the courts should declare the findings erroneous, is unjust. The court could seldom say that an error or injustice was shown on the very face of the record; so the commission's orders would usually remain in force throughout the proceedings, and injustice would often be done for a long time to the railways.

The commission in its past actions has often shown itself wise, and the railways have usually accepted its rulings. Nevertheless, it has often shown that it has prejudged the case and has been biased. The decision of the commission is not similar to that of a board of arbitration, since both parties agree to submit the question in the case of arbitration and since both have a voice in the selection of the arbitrators. The witness does not desire that the railways should be

entirely free from control, but he is not willing that 5 governmental officers should replace them as managers of their vast property. The railways certainly possess some vested rights.

Mr. Blanchard declares further that the English railway and canal commission, which is cited as justifying increased powers in the Interstate Commerce Commission, is different in its constitution and powers and offers no precedent. The English body consists of two commissioners who hold office during good behavior, and three ex-officio members, who are at the time and continue to be judges of the superior courts, and who act for 5 years. One of the appointed commissioners must have had experience in railway affairs. The commission, as thus constituted, is evidently more a judicial body than the Interstate Commerce Commission. Moreover, the English commission has no administrative powers, but only judicial powers. For the most part it can act only in case of complaint, although it has certain powers as to approving agreements between railways, ordering through rates, and ordering changes in canal rates in case a railway owns a canal and tries to divert traffic from it to the railway. It is not charged with detecting violations of the law itself and has no authority to investigate accounts or institute complaints in its own name. The Interstate Commerce Commission, on the other hand, has large administrative and inquisitorial powers, which have a strong tendency to deprive it of the judicial temperament. In fact, to permit the Interstate Commerce Commission to render final judgment against a railroad would be like allowing a party to be judge in his own cause or like permitting a man to be convicted of murder by the grand jury which indicted him. There is an appeal from the decision of the British railway and canal commission as to questions of law, notwithstanding the fact that it is itself constituted as a judicial body.

Mr. Blanchard points out further that the conditions of railway traffic in England are different, so that greater restrictions upon railway rates would be justifiable there than in this country. The freight rates are about double those in this country. The railways are more fully protected in many regards by the law. Thus their stations are more carefully policed, the liability for damages is more fairly interpreted, etc. Moreover, the construction of new competing roads is carefully regulated. Before a line can be built it must be demonstrated that it is a reasonable public requirement, while with us the building of parallel lines is often unwisely encouraged. Mr. Blanchard also speaks in some detail of the permission of pooling in England. (659-665.)

Mr. SPENCER, of the Southern Railway, does not believe that the commission should be permitted to amend and rectify rates, except under the right of appeal to the courts, while its decisions, if appealed from, should not remain in force until upheld by the court. Otherwise the railway may have suffered for two or three years by being forced to maintain an unreasonably low rate pending the trial. If a shipper, on the other hand, is injured during the duration of the suit he can collect damages. If on account of the smallness of the debt he will not take the trouble to collect them, that is no reason why the railways should pay him what is not due. The members of courts are supposed to be trained jurists, and they have a greater responsibility than the members of the Interstate Commerce Commission. If, however, the commission itself were constituted as a court, with life membership, and with a court's powers and responsibilities, the witness would be willing to submit the question of reasonable rates to its final decision. (282, 283.)

Mr. TUCKER, chairman of the Central Freight Association, thinks that the reasonableness of rates should be left to the courts. He would not have the railroads compelled to conform to rates fixed by the Commission until the courts should rule otherwise. He does not think it possible for the Interstate Commerce Commission to have properly in view the tonnage, the expenses, the risks, and all the circumstances which make a given rate necessary. (558, 560.)

Mr. STICKNEY, president of the Chicago Great Western Railway, declares that the Interstate Commerce Commission has all the powers it ought to have. Nevertheless, it is, as a whole, little more than a farce, although it has had some educational influence. Its powers ought not to be final, since in taking evidence it does not follow the rules of courts. In fact, the less government interference in the case of railways the better. (463.)

F. Publicity of accounts and books.—*Advocated.*—All of the members of the Interstate Commerce Commission who appeared before the Industrial Commission believe that the essentially public character of railway service justifies the requirement of much greater publicity of railway affairs than is now secured. No effective regulation is possible without thorough knowledge. This publicity can be best promoted by permitting public examiners to inspect the books and accounts of

railroads at any time. Such inspection is fully as justifiable in the case of railways, with their immense influence upon the public welfare, as in the case of banks and insurance companies. Government inspection of these latter concerns has been distinctly beneficial. Many criminal violations of law by railways, such as granting of rebates, are covered up by deceptive entries in the books, and can not be ascertained readily when, as sometimes happens, the books are brought into court in case of suits. It requires expert skill and often long investigation to make the publicity of books effectively beneficial. In connection with such a system of inspection the requirement of uniform methods of bookkeeping might be advantageous. Mr. Clements, however, does not think that publicity alone, without power to punish or regulate, would be a sufficient remedy for existing abuses. (KNAPP, 141; CLEMENTS, 159, 160.)

Mr. NEWCOMB thinks the powers of the Commission to secure statistics and to inspect accounts, etc., should be extended. For instance, it is desirable to know the freight rates on different classes of traffic for through and local business, which we are not now able to ascertain. (104.)

Professor JOHNSON declares that publicity is essential as the very foundation of supervision by public authority. Rates published must be strictly observed, and accounts of railways must be open to inspection to show such observance. (62.)

Professor SELIGMAN thinks that the prescription of uniformity of accounts, and Government inspection of accounts, of transportation companies, are not only advisable but imperatively necessary. Such regulations would not only be useful for purposes of taxation, but they are needed on account of many other questions of the relations between railways and the Government. (605.)

Mr. INGALLS, president of the Chesapeake and Ohio, believes that the public character of railways justifies the most thorough possible publicity, and that publicity is the most effective remedy for all existing evils. He advocates the examination of the books of railways by public inspectors in the same manner as the books of banks are examined. The various scandals and false accountings, with their injustice to the public, and especially to stockholders and investors, would thus be prevented, and discriminations also would be checked. (287, 297, 298, 301.)

Mr. SPENCER, of the Southern Railway, thinks that publicity is the chief remedy for discriminations as well as for unjust rates and other abuses. As a matter of fact, if discriminations were abolished, nine-tenths of the problem of Government supervision of railroads would disappear. The witness recognizes the fact that railways are quasi-public corporations, and that if rates actually became burdensome direct legislation would be justifiable, but he thinks that rates are not often unreasonable, and that publicity is a sufficient remedy. He would have no objection to the establishment of inspectors who should examine the books of railways, provided they would use ordinary respect for the private part of the business, especially not revealing information to competitors. To some extent the railways might evade the inspection by various methods, and for this reason the witness thinks that the criminal phase of the interstate-commerce act should not be abandoned. (271, 278.)

Mr. MORRIS, of the Atchison, Topeka and Santa Fe, believes that the more publicity is required of railroads the better. The immense importance of railway rates and of fair treatment of all shippers justifies the requirement of such publicity. (590.)

Depreciated.—Mr. CALLAWAY, president of the New York Central, does not approve of requiring the books of railways to be open to the inspection of examiners, although as far as his own road is concerned there is nothing in the books which the world can not see. Competitors might be given information to the detriment of the railway under this system. The sworn statements made to the various State railway commissioners and to the National Government already give all necessary information. (237, 238.)

In the opinion of Mr. COWEN, of the Baltimore and Ohio, the inspection of railway books by public officers would not accomplish any particular good, although it might prevent suspicion and discontent on the part of the people, and is not especially objectionable. At present people wishing information concerning railways consult Poor's Manual rather than the publications of the Interstate Commerce Commission or other official bureaus. (317, 318.)

Mr. STICKNEY, of the Chicago and Great Western, opposes the inspection of railway accounts by Government officers or any interference by Government with private business affairs. He even thinks that the national-bank examiners have burst more banks than they have ever saved. (161.)

G. National charters.—Mr. BLANCHARD, late commissioner of the Joint Traffic Association, thinks that national charters for interstate railways would be undesirable. There would result a constant conflict with the rights of the State.

Moreover, there are important railroads which lie wholly within one State, and yet do a large interstate traffic. Furthermore, incorporation under national laws would give an erroneous feeling that the National Government had a right to control the traffic within the States upon such railroads.

H. State railway commissions.—Mr. REAGAN, of the Texas railroad commission, believes that Congress should prohibit the Federal courts from issuing injunctions during the pendency of suits to prevent the enforcement of rates fixed by the Interstate Commerce Commission or State railroad commissions, until the rates have been found unjust or illegal. Some deference is due to the actions of railway commissions, and the power of injunction is too great and too dangerous to be intrusted to the arbitrary will of any one judge. (344.)

The Texas railroad commission has absolute power in fixing rates, subject only to appeal to the courts. The constitutionality of the statute was upheld in the case of *Reagan v. The Farmers' Loan and Trust Company* by the Supreme Court of the United States. The railways at first opposed the law, but most of them now claim that it is beneficial to them as well as the public, stopping the cutting of rates and the wasting of revenue. The commission has power to examine the books of railways, and has used it to advantage; and Mr. Reagan favors giving similar power to the Interstate Commerce Commission. (339, 44, 349.)

X. TAXATION, ESPECIALLY AS APPLIED TO RAILWAYS.

A. General discussion of railway taxation.—Professor SELIGMAN, of Columbia University, presented a general discussion of corporate and especially railway taxation.

1. General principles of taxation.—Professor Seligman considers that taxation is not only to be utilized for fiscal purposes, but also for such social purposes as are approved by the majority. There are two classes of thought on this subject throughout the world. One is that of the extreme individualists, such as Hon. David A. Wells, who believe that as soon as taxation is used for other purposes than revenue it is not taxation but confiscation. On the other side are the socialists, who maintain that the great problem to-day is the social and economic problem; and that a tax is not a tax unless it has a social object. Professor Seligman thinks the great mass of scientists and statesmen will confess that both the theory of the subject and the history of the world show that taxation must be utilized for both purposes; that the primary end is to secure revenue, but that we must not shrink from utilizing taxation for any desirable end for which taxation is a workable means. (605.)

The difficulties of taxation problems arise largely from the fact that our legal and constitutional conditions are not in harmony with our economic conditions. In the long run, law is nothing but the outcome of economic conditions. As economic conditions change, the law necessarily follows. But the change takes time, and in the interval of maladjustment we are subject to evils such as we see. (602.) The tax situation may be much improved if the legislators will realize that they can take only one step forward at a time. (608.)

The wealth of the nineteenth century consists, far more largely than in past times, of what is known as personality. The largest part of this personality under modern conditions consists of corporate securities. The problem of just taxation, therefore, is very largely the problem of corporation taxation. (599.)

The problem of corporation taxation may be approached from several points of view. In the first place, there is the general question of revenue—what revenue we can get or ought to get from transportation and other corporations; second, there is the question of justice to the various individuals interested in the corporations. There are also questions of a different class arising out of the relations of the State governments and the Federal Government. (599.)

2. Federal and State taxation.—Professor SELIGMAN considers it a primary principle that the Federal Government and the State governments should draw their revenues from different sources so far as possible. He points out that this has always been our general policy. The Federal Government has largely depended upon the so-called indirect taxes, and has seldom touched those sources of taxation which are depended on by the States. He considers it an unfortunate exception that the Federal Government has recently levied a tax on inheritances. In our leading States, like New York, Pennsylvania, and Massachusetts, there is a well-marked tendency to derive State revenues in increasing proportions from inheritances and corporations, relegating the general property tax to the local divisions. This is a wise policy, and Federal taxation of interstate commerce would bring in a further disturbance of it by interfering with the power of the States to collect a large portion of their revenues from corporations. This seems

a sufficient reason why the Federal Government should not make taxation of corporations a source of revenue, though it is entirely possible that Federal taxation might well be laid on corporations for other purposes. (599, 600.)

On the other hand Professor SELIGMAN does not consider that any difficulty is likely to arise from constitutional impediments to taxation of railroads by the United States. The Government has a right to tax any corporation, whether created by itself or not. The gross receipts tax during the civil war, though economically a direct tax, was considered by the courts an indirect tax and constitutional. The stamp tax has recently been upheld as a tax on business, and the Government is now taxing inheritances; though the constitutionality of this tax is still unsettled. (608.)

3. *Interstate complications—Double taxation.*—The problem of corporate taxation is much complicated by the fact that a corporation may have its legal situs in one State and its actual property in another, and may be owned in a third. So far as domestic corporations are concerned the State is at perfect liberty to levy a franchise or excise tax, measured by the total receipts of the corporation. A tax can not be levied by a State upon gross receipts, so far as those receipts are derived from interstate commerce. But through a fiction of the law, a tax under the name of a franchise tax or an excise tax is held to be valid, though the value of the franchise or excise is measured by the gross receipts. Such a tax, however, can be levied by any State only upon corporations which it has chartered. Under modern conditions a large part of the corporations doing business in any State are, as a rule, chartered by other States. A franchise tax upon such foreign corporations is held by the Supreme Court of the United States to be a tax upon business; and it can not be levied upon receipts derived wholly or in part from interstate commerce. It results that a great mass of corporate business can not be reached by any tax on receipts. Some States attempt to solve the problem by taxing the corporations upon valuation or upon capital stock, and in some cases also upon bonded indebtedness. (600, 601.)

Again, the taxation of corporations which do business in several States, upon their capital stock, is subject to great difficulties in the determination of the amount upon which the tax should be levied. The Western Union Telegraph Company does business, perhaps, in every State. If its entire stock were taxed in every State, the company would be taxed 50 times. There has been a tendency in the last few years, as in the taxation of express and telegraph companies in Ohio and Illinois, and in a few other cases, to tax that proportion of the valuation which is employed within the State. In the case of transportation companies this proportion is measured by mileage. While a division on the basis of mileage is not altogether fair, and would be entirely unfair if it were extended to small subdivisions, some of which include great terminals, it serves tolerably as a basis of State taxation. It seems the only practical way to levy a tax based upon the value of a corporation's capitalization. (601, 603, 604.)

The same difficulties in avoiding or adjusting double taxation which we have in the United States are found in all modern federal governments. They are found in Germany and in Switzerland, and will appear in Australia under the new form of government. They are perhaps most prominent here, because the legal idea of State sovereignty is strongest here. In Canada, where the provinces are not legally sovereign, the problem does not exist. (600.)

Professor SELIGMAN suggests two general lines in which advance toward the correction of the evils of double taxation may be made. One is to try to secure uniformity of State action, perhaps through Federal pressure. Many of our existing evils arise from the diversity, complexity, and opposition between our State laws. If the Federal Government would enact a law for the calling together of annual conventions of State commissioners to meet with Federal commissioners who should be appointed, and to consider the questions involved from the point of view of general utility, the views of the State executive authorities and ultimately the action of the State legislatures might gradually be brought into harmony and unity. A Federal officer or commission appointed for the purpose would be desirable, because Federal officers would naturally take the national rather than the State point of view.

The second way would be by the direct intervention of Federal authority. While it would be unwise for the National Government to make corporations a source of direct revenue to itself, it might make itself an agency for collecting revenues from them, to be afterwards distributed to the States. Such a plan is followed in England as to the inheritance taxes, and Germany and Switzerland follow a similar plan to some extent. In our own country we have the precedent of a distribution of money by the Government to the States. While the witness would not advise the adoption of this plan until the futility of the first plan has

been shown, he would consider it perfectly legal and constitutional and an available way out of our difficulties if no better way is found. If it were adopted, the rights of the stock and bond holders, as well as the location of the railways, ought to be considered in arranging the division. (602, 603, 607-609.)

4. *Taxation of capital stock and bonds.*—Professor Seligman would consider it best to tax the market value of capital stock rather than its par value. He considers that every real economic increase of capital ought to be taxed. Water is not an economic increase of capital, because it does not increase the earning capacity of the company. A tax upon watered stock might perhaps be desirable to check watering; at least that end is desirable. The difficulty is that a tax would strike the honest in trying to reach the dishonest. There may be an increase of capital which seems to be water and yet is not. We may not be able to tell until some years have elapsed. It is true there is sometimes an increase of capital stock for mere jobbing purposes, and this may for the time being increase the credit of the stock, and cause it to sell at higher rates. But it is frequently difficult to draw the line between what is fictitious and what is actual capital. The Massachusetts method of dealing with stock watering is better. (609, 610.)

Professor Seligman says that it is manifestly unfair to tax corporations upon capital stock, excluding bonds. Two corporations may have each a capital stock of \$100,000, but one may have a further working capital, represented by bonds, of \$200,000. The second corporation has an actual capital three times as great as the first. The particular form of document issued to investors does not affect the economic conditions of the problem. The second corporation ought to pay three times as much tax as the first. But the United States courts have held that a tax upon the bonds of a foreign corporation is a tax upon the bondholders; and, consequently, since the State has sovereignty only within its own borders, no State can reach corporation bonds which are held outside. However defensible this decision may be legally, it is economically incorrect. The possibility of a just system of taxation based on capitalization is destroyed by it. If you try to tax corporation bonds, and can tax them only so far as they are owned within the State, you will soon have no bonds within the State to tax. (601, 608.)

5. *Taxation of net receipts.*—Professor SELIGMAN considers the taxation of net receipts more equitable than any other system. Everywhere else in the world where transportation companies are taxed, with the exception of the cantons of Switzerland, the tax is based somewhat on the net receipts. He does not consider, however, that under our present conditions such a tax is practically desirable. The great corporations could easily succeed in so scaling down the nominal net receipts that they would not have any receipts to tax. The difficulty would appear especially in the case of manufacturing corporations. In order to make the tax successful as to any class of corporations, net receipts would have to be defined as they never have been defined before, even by the Interstate Commerce Commission. Yet it would be possible by careful statutory definition of net receipts, by prescription of uniformity of accounts, and by Government inspection of accounts, to reach such a public knowledge of the net receipts of quasi-public corporations as should make the tax on their net receipts practicable and just. (604, 605.)

6. *Taxation of gross receipts of railroads.*—Professor SELIGMAN says that the practical difficulties of the taxation of net receipts have led the most of our States, so far as they tax receipts at all, to base the tax on gross receipts. This system is theoretically far less good, but has many practical advantages. The difficulties which our constitution puts in the way of any State tax on receipts are referred to above. (See *Interstate complications, Double taxation*, p. 120.) Professor Seligman believes that the taxation of gross receipts in Wisconsin is comparatively light, and that the interstate railways have acquiesced in it without raising much objection. In other States, as Maine, where it was sought to get a large part of the revenue from this object, the corporations have fought the law and have succeeded in fighting it. (603, 601.)

7. *New Jersey tax system and corporation law.*—Professor SELIGMAN considers that the tax system of New Jersey is on the whole very wise, and that the entire system of corporation law of New Jersey is in some respects in advance of the systems of many other States. New Jersey is peculiarly situated, in that a great deal of property belongs legally to her which belongs economically to New York. Rules which might apply to her might not altogether apply under other circumstances. (606.)

B. *Special cases and opinions.*—1. *General property tax on railroads.*—Mr. REAGAN, of the Texas railroad commission, favors the general property tax on the basis of the actual value of the property of railroads. He thinks that the State railroad commission rather than anybody else should fix the valuation, since it alone

has the means of knowing the facts concerning railroad property. Thus the Texas railroad commission has valued one road, capitalized at \$60,000 per mile, at \$18,000 per mile, while the assessment for taxation is only \$8,000 per mile. The witness does not favor a tax on the value of railway franchises in addition to the tax on property or on earnings, nor does he favor taxing both property and earnings. (348.)

Mr. COWEN does not think that the methods of taxation in the States reached by the Baltimore and Ohio system are especially unjust. In many of these States the physical property of the railways is assessed to the general property tax, by State officers, the valuation being distributed among the localities. This system is preferable to the gross receipts tax which prevails in Maryland and Ohio, since it avoids difficulty as to the question of taxing receipts from interstate traffic. (319.)

Mr. SPENCER, of the Southern Railway, declares that, under the general property tax in the Southern States the assessed value of railway properties is often much too high. The assessment is usually based upon the mileage, with special assessments of depots and such property and of rolling stock. (282.)

2. *Gross receipts tax on railways.*—Mr. CALLAWAY, president of the New York Central, thinks that the taxation of gross earnings is the fairest method, and approves the graduation of the tax according to the amount of earnings. He says that under the general property tax the New York Central, especially on account of the high assessments of its terminal properties, pays no less than 12 per cent of its net earnings in taxation. A gross earnings tax at such a rate as that applied in Michigan would not amount to more than 3 or 4 per cent of the net earnings. Taxation of net earnings is not desirable, because the Government is entitled to some payment from the railways whether they are earning any profit or not, and because interest on the bonds, which often constitute the chief cost of the railway, is deducted in calculating net earnings. (228.)

Professor JOHNSON would be inclined to tax railways on their gross earnings. A license tax is most satisfactory of all. The general property tax results in a score of different tax rates. Since the rates and fares of railways largely depend on influences which they can not control, it is probable that a tax on gross earnings can not be shifted. The Supreme Court has decided that the States can tax railway property only so far as it lies within their own boundaries, but has upheld the Ohio law, which has put a liberal interpretation on what property lies within such boundaries. (63.)

The Illinois Central, by the contract in its charter with the State of Illinois, declared fixed by the constitution, pays 7 per cent on its gross receipts to the State. While Mr. FISH considers the gross receipts tax the fairest, he declares that this percentage is excessive. It was based on the supposition that operating expenses would be not over 50 per cent of the gross receipts. As a matter of fact, exclusive of taxes, the operating expenses of the railroad are now about 62½ per cent. Such rates as prevail in the West, 2½ to 4 per cent, would be fairer. (232, 233.)

3. *Net receipts tax.*—Mr. NEWCOMB, of the division of statistics, Department of Agriculture, says that scarcely any two of the States have the same system of taxation. Where a State attempts to secure a higher tax from railways than its neighbors, the effect is often to increase rates or decrease facilities for its own citizens, since taxes are largely shifted. A tax on net earnings is the only just and scientific one. Taxation of the property of a railroad is impracticable on account of its character and location, and because of the peculiar relation between its visible property and its franchises, stocks, bonds, etc. A tax on gross earnings is likely to lead to high rates, giving a smaller total of gross earnings but added profits through a lower percentage of operating expenses. The proposition to tax interstate commerce for the benefit of the Federal Government might tend to check the territorial division of labor, but is worthy of consideration. It is just to differentiate the methods of taxing railways from those of taxing other forms of property, for different incomes are different in their nature and in the degree to which they are earned. It is difficult to establish a uniform system of taxation among different States on account of the limitations of their constitutions. (101, 102, 105, 106.)

C. *The general property tax.*—Professor SELIGMAN remarks that questions of taxation do not present the same difficulty in the agricultural States of the South and West as in the highly developed industrial States of the North and East. In the agricultural States the general property tax still serves fairly successfully. The more highly developed States are getting rid of it, at least for the general revenue of the State. Besides New Jersey there are other States, Connecticut among them, which do not levy any State tax on general property. At

the time of the testimony New York had a plan under consideration by which the same result was to be reached. The general property tax is suitable to a certain stage of economic development, and everywhere in the world at a certain stage of economic development it is found. It was found in Europe in the Middle Ages, and it has prevailed in our own country; but when the fit stage is passed the property tax is bound to go. The general property tax, maintained under unfit conditions, resolves itself into a tax on real estate, plus a more or less wild guess at the personal property. (602, 603, 607.)

In a great many of the States the complaint of the farmers that they bear more than their share of taxation is just. The reason is that while the chickens and cows are assessed to the farmers the personal property in the cities largely escapes taxation. Professor Seligman has no faith in the possibility of enforcing the personal property tax by means of any system of listing or by any severity of penalty. The law recently enacted in Illinois is simply another example of the new broom sweeping clean. It works as long as everybody believes that the law is going to be enforced, but it takes only a very short time for everybody to conclude that the law will not be enforced. (607.)

Mr. Newcomb says that he would favor abolishing the personal property tax and laying a general tax on real estate, including the improvements. He would not abandon franchise and internal-revenue taxes and others having special advantages. It is not necessary or just that all classes of property and income should be taxed in the same way. Different incomes differ in their nature and in the degree to which they are earned. (105, 106.)

D. Franchise taxation. Professor SELIGMAN remarks that three different rights are given to corporations by government. First, the right to become a corporation. That is paid for in New York, as in most other States, by incorporation fees or bonuses on charters. The second right is the franchise, not to become, but to be, a corporation. That is paid for by so-called franchise or license taxes levied at intervals upon capital stock or upon gross receipts or otherwise. The third right is a privilege of certain corporations to make use of the streets and highways, by going either below or above them. It is this third privilege which the Ford franchise tax law of New York seeks to reach. It applies only to those quasi-public corporations which are sometimes called municipal monopolies—street railways, gas companies, electric-light, steam-heat, and power companies, etc. Such companies own little or no real estate. The streets, where the principal business is done, do not belong to them. The value of their property as a whole is very much more than the value of their tangible assets. This difference between the value of their tangible assets and the total value of their whole property is what the Ford bill tries to reach. Professor Seligman considers such a tax entirely proper, and thinks that all franchises of a quasi-public nature ought to be paid for over and above the general rate of taxation. (606, 610.)

E. Taxation of inheritances. Professor SELIGMAN regards taxation of inheritances as proper and highly desirable for the States. It is one of the means by which the States will be enabled to separate their sources of general revenue from the sources of revenue of their subdivisions; and this is the first step to be accomplished in the reform of State taxation. For this very reason it is undesirable that the Federal Government tax inheritances. Such a tax will make it more difficult for the States to obtain a large revenue from this source, and so will constitute an interference in the progress of reform of State taxation. (599, 603.)

XI. GOVERNMENT OWNERSHIP OF RAILWAYS AND TELEGRAPHS.

A. Advocates of government ownership of railways.—Mr. GREELEY, a commission merchant of Chicago, thinks that no legal regulation will prevent railroad discriminations and abuses. Pooling would not prevent special rates; it has been tried many times and found wanting. The only remedy, therefore, is Government ownership of railroads, and in order to make this feasible the standard of the civil service must be greatly raised. Even as it is, however, aside from excessive payments which it has been forced to make to the railroads, Mr. Greeley believes that the United States post-office is run on as cheap a basis as any private institution in the world. Government ownership would reduce freight rates about one-half. It would not do to take away the right of employees to vote under Government ownership. Mr. Greeley thinks, also, that the United States Government should operate public grain warehouses. (379-381.)

Mr. Lewis, of Cumberland, Md., submitted a written argument in favor of Government ownership of railroads.

Mr. Lewis believes that under Government the following objects may be attained:

First. The just security of the capital invested upon the basis of its commercial worth. Precarious securities will become things of the past.

Second. Uniformity and equality of freight rates among shippers; the elimination of quasi-natural discriminations as well as willful.

Third. A half-cent passenger rate per mile over the entire country.

Fourth. An 8-hour day for all railway workers, and the consequent employment of 165,000 of the unemployed to fill this one-fifth reduction in time.

Fifth. The greater development of the natural resources of the country by a sensible application of the capital now invested in "parallels," etc.

Sixth. A juster distribution of railway mileage to the population and area of the several States. The grossest inequality is the necessary effect of the present system.

Seventh. The establishment of a system of postal express, which it seems might be conducted, in conjunction with the post-office, at half the present cost to the public.

Eighth. The institution of accident insurance for passengers, employees, and freight under certain limitations.

Ninth. The emancipation of public men from the evil influences of railway "politics," and the attainment of free elections.

Tenth. The adoption by the Government of punitive freight rates, when considered necessary to destroy existing trusts and discourage the formation of others. (724.)

1. *Estimated financial results.*—Mr. LEWIS gives a detailed estimate of the receipts and expenditures of the railroads under Government ownership, from which he deduces a net revenue to the Government of over \$70,000,000 per annum. Forty million dollars is due to the elimination of State taxation of the railroads. A saving of \$165,000,000 in the annual interest charge is expected, because of the ability of the Government to borrow at one-half the rate of interest which the railroads, on the average, have to pay. Seventeen million dollars is to be saved by the elimination of some 1,500 railway presidents, who "in most instances represent the financing rather than the actual management of the railroads." The superintendents, the actual trained railroad men, would be retained. Other large savings are \$12,500,000 for legal expenses, advertising, and commissions; exclusive use of shortest routes, \$15,000,000; savings by uniformity of rolling stock, machinery, accounts, etc., under single control, \$15,000,000; abolition of fund for legislation, corruption, lobbies, etc., \$10,000,000; elimination of pass evil, \$5,000,000; elimination of "outside agencies," \$11,000,000. On the other hand Mr. Lewis allows an additional cost of \$90,000,000 for reducing the hours of labor of all railroad men to 8 per day, and adding one-fifth to the number of men, paying all the same wages per day which are now paid. He adds a further sum of \$6,000,000 to raise the average daily wages of the trackmen from \$1.17 to \$1.30. (725-744.)

When Switzerland purchased her railroads in 1898 she fixed their value by capitalizing the average net profits of the roads for the previous 10 years. Mr. Lewis would have the United States follow a similar plan, capitalizing the interest paid on bonds at 5 per cent, the dividends paid on stock at 6 per cent, and the rent paid for equipment, terminals, etc., at 12 per cent. He would have the existing owners paid the full value of their property, as so arrived at. He estimates that the entire funded debt, stock, and rented property would be covered by a cash payment of about 6½ billions of dollars. (727-729.)

If the railroads were bought for 6½ billions of dollars the debt of the United States would then be less than \$100 per head of population. The debt of France is about \$162 per head, and the 3 per cent bonds of France are above par. Moreover, the purchase of the railways would not involve a real increase of debt, since the railroads would be an asset fully equal in value to the face of the bonds issued. Mr. Lewis would have the bonds exchangeable at will for Treasury notes and the notes exchangeable at will for bonds. He believes that such bonds to the necessary amount could be floated at 2½ per cent. (731.)

Mr. Lewis notes that from 1890 to 1897, the last year covered by his statistics, the amount of passenger travel in the United States did not vary more than 7 per cent. The amount of freight business showed a fairly steady increase. From these facts Mr. Lewis draws the conclusion that while on any one road the results of operation may greatly vary from year to year, the results of the operation of the whole system of the country are calculable. It is possible to foretell the results of railway management as a whole, just as it is possible to foretell the experience of life insurance companies. The elimination of the element of risk, by uniting all the railroads in a single system, furnishes an additional argument for the ownership of all by the Government. (738.)

2. *Security of property.*—Mr. LEWIS gives quotations of stocks and bonds of 30 principal railways for 1897 and 1898, showing that the value of stocks fluctuated from 30 to 300 per cent, and the value of bonds from 5 to 100 per cent, in each of these years. This reduces the ownership of such securities, he says, to a matter of gambling. Government purchase would substitute Government bonds, stable in value, for these so fluctuating issues of the railways, and would offer a secure investment for savings instead of a temptation to speculative gambling. (726, 727.)

3. *Extension of the system.*—Mr. LEWIS believes that the railway system would be more wisely extended by governmental action than under the stress of competitive private interests as at present. To prevent the improper building of new roads through political influence, he suggests that, while all roads should be built and operated by the Federal Government, States and counties thinking themselves entitled to new roads should bond themselves to cover the cost of construction. If the traffic of the new roads should justify their construction, the Federal Government should pay the cost. If not, the local bodies which had them built should bear the burden. (742.)

Mr. Lewis estimates that perhaps one-fourth of the capital now invested in railways is wasted in duplication. He considers that such waste would be entirely saved for the future by Government ownership. (741.)

4. *Freight rates under Government ownership.*—According to the Interstate Commerce Commission's Report, the average receipts from freight service in 1896 were 8.6 mills per ton per mile. Mr. LEWIS suggests that under Government ownership there should be adopted, generally speaking, a uniform rate of about 8 mills per ton per mile. He does not desire, however, that freight should be carried like letters, without reference to actual cost of service. (732.)

Mr. Lewis suggests that if the Government owned the railroads there should be a commission to determine when an industrial organization had become a trust, and the Government should then impose double freight rates upon the products of such trusts, or prohibit the transportation of them altogether. (748, 749.)

5. *Reduction of passenger fares.*—Mr. LEWIS states that a reduction of passenger fares of about 40 per cent in Austria-Hungary increased passenger traffic 50 per cent. He believes that a reduction of passenger fares in the United States to one-half cent per mile would increase the number of passenger miles traveled from 13 billions, in 1896, to at least 26 billions. The number of passengers could be doubled without any appreciable increase of cost, for the number of passengers per train averages only about 41 or 42, and the capacity of the trains is several times as great. It costs no more to haul a full train than an empty one. Mr. Lewis bases the argument for so radical a reduction of fares not so much upon the probability that it would pay in a pecuniary sense, as upon the educational and refining influences of travel, and upon such considerations as the ready movement of laborers from place to place as their services might be demanded; in other words, upon general social utility. In the management of the railroads, as in the management of the post-office, considerations of profit should be eliminated and only social utility should be considered. (733, 734.)

6. *Postal express.*—Mr. Lewis states that something above 40 per cent of the gross receipts of the express companies goes for payment for railroad transportation, and the remainder goes largely for supporting independent offices and warehouses, for handsome salaries, dividends, etc.; the only service performed by them which is of social utility being delivery by wagons in cities. He believes that with governmental ownership of railroads and management of the express business in connection with the post-office the business could be conducted at about one-half of the rate now charged by private companies. (745, 746.)

7. *Accidents.*—The witness gives figures to show that the proportion of passengers killed in the year 1890 was, for the United States, 1 to 1,721,786; for Germany, 1 to 9,262,092; for Austria-Hungary, 1 to 17,409,734; the number of passengers injured, for the United States, 1 to 203,064; for Germany, 1 to 1,805,323; for Austria-Hungary, 1 to 1,291,300. Of the men employed on the railroads the number killed in 1890 was, for the United States, 1 in 306; Germany, 1 in 759; Austria-Hungary, 1 in 1,067; of men employed there were injured, in the United States, 1 in 33; Germany, 1 in 169; Austria-Hungary, 1 in 292. Mr. Lewis believes that the great contrast between the United States on the one hand and Germany and Austria-Hungary on the other is to be attributed to the difference between private and governmental management. Many of the accidents in the United States Mr. Lewis believes to be due to the excessive amount of work demanded of railway employees. (743.)

Moreover, Mr. Lewis would unite with Government ownership of railroads a system of governmental accident insurance, designed particularly for the benefit of railroad employees, but available also to passengers. As indicating the social

inefficiency of existing accident insurance companies, he points out that they return to the insured in payment of losses only about \$6,000,000 for \$16,000,000 collected in premiums. (744, 745.)

8. *Political effects, civil service.*—Mr. Lewis considers that the railroads, instead of getting into politics through public ownership, would be less in politics than now. The postal service, with its nearly 200,000 employees, is relatively free from politics, as compared with the railroads. The railroads constantly interfere with Congress, legislatures, county and city officials, and the courts. (746, 747, 750, 751.)

Mr. Lewis says that no one, he believes, has ever advocated public railways without demanding at the same time a thorough enforcement of genuine civil-service reform. (746, 747.)

He adds that the presidencies of railroads are largely occupied by men who have no practical knowledge of railroad affairs, and many of the lower offices are filled by favoritism. Nepotism is more rampant in railway management to-day than in any of the departments of the public service. Under public ownership the railway service would be confined to trained railway men. No one should be eligible for advancement but some railway man who had passed a suitable examination, and promotion should also be determined in part by the record of each man's errors in his previous work, as in the postal service. The post-office is on the whole the best-managed industrial enterprise in the United States. The record of business failures, showing an average bankruptcy among private business enterprises of some \$200,000,000 per annum for the last 20 years, seems to Mr. Lewis to indicate the inefficiency of private management. (746, 747.)

Referring to the aphorism that the least government is the best government, Mr. Lewis remarks that the systematic exercise of power by any set of persons is in itself government, whether the power is exercised under the name of government or not. The railroad managers at the present time exercise enormous power over their employees, not only as to their economic condition, but even as to their social and political action. Moreover, the railroads are able to wield political power, not only by their influence over their employees, but also by their direct interference with Congressmen, legislators, governors, judges, and tax assessors. The post-office exercises little influence, if any, upon our Government. The privately owned railroads exercise enormous influence upon it. Public ownership of them would result in a diminution, instead of an increase, of their governmental influence. (749-751.)

B. *Opponents of government ownership.*—Professor SELIGMAN, of Columbia University, says that we have in this country 3 different stages of economic life existing at the same time—the frontier life in some of the Western States, purely agricultural communities in some of the Southern States, and most fully developed industrial communities in a few Eastern and Northern States. This is one of the reasons why the solution of all economic problems is so much more delicate in the United States than in any of the compact and complete communities of the Old World. It has taken those communities 1,000 or 2,000 years to get a development which we are getting through in a few decades. Some of our States are, practically, as regards certain economic conditions, where Europe was in the Middle Ages. (607, 608.)

The great end of individual initiative in general is to turn ability toward the reduction of cost of production by inventions, etc. All progress consists of lowering the cost of production by driving out old processes and introducing new. This method of improvement results not only in lower prices for the community, but in higher wages for the operative, as well as prosperity for the employers. (611.)

Professor Seligman says that three considerations determine the desirability of Government ownership of any industry: First, the existence or nonexistence of widespread social interests. Second, the amount of capital invested; the need of large capital is an objection to Government ownership. Third, the complexity of the management; public authorities can best handle businesses which are comparatively simple, and whose methods are likely to change but little. (610.)

The witness, while favoring Government ownership of telegraphs, is distinctly opposed to public ownership of railroads in the United States. Two of the criteria named seem to him to be conclusive against it. (1) In the railway service we have the greatest possible amount of capital invested. If the Government owned the railroads their revenues and expenditures would be two or three times as great as all the rest of our revenues together. The whole budget of the country would be thrown out of gear, and everything would depend upon the success and prosperity of the railway system. (2) The requirements for skill in man-

agement are of the highest. The greatest salaries in this country, salaries from \$25,000 to \$100,000, are given to the railway presidents, and deservedly so. The Government could not hope to compete successfully in such a line of business with private individuals. A democracy will not pay very high salaries to public officers, and with low salaries the temptation to the highest order of ability would not be great enough. It is true that governmental service has an attractiveness which compensates in part for loss of salary, but under the present necessarily materialistic drift of our people, with a whole continent to conquer, this incentive to public service can not be sufficient to attract the highest order of talent. There are numerous instances of men quitting the Government service because of small salaries, and many of the men of the first class who do serve the Government for comparatively small pay are men of independent means. In Prussia the conditions are different, and to a certain extent in France. This is one of the reasons which make public ownership of railroads in Prussia feasible and desirable.

A third objection to Government ownership of railroads in this country is the fact that the States would be deprived of the income which they derive from taxation of the railroads. (606, 610-613.)

Mr. KNAPP, chairman of the Interstate Commerce Commission, is inclined to believe that, while Government ownership would prevent discriminations between individuals and while the published rates would be observed, political influences would be so brought to bear that discriminations between different places and sections of the country might be even more serious than at present. At the same time the immense number of railway employees would make them a dangerous political influence under Government ownership. (145.)

Mr. NEWCOMB, of the division of statistics, Department of Agriculture, thinks that Government ownership would be one of the two possible methods of preventing unjust competition and discrimination. There would be, theoretically, great saving in the "cost of production," by a consolidation of the entire railway system; but such a consolidation could not be allowed in the hands of a private individual, while to put it under the Government would at present be unwise. Government business usually costs twice as much as private business, and it would require fully a generation for us to secure an administrative system competent to handle the railway business properly. We must try to regulate first and later may look for Government ownership. (102, 103.)

Mr. REAGAN, chairman of the railroad commission of Texas, thinks that Government ownership of railroads would necessarily increase the cost of transportation greatly. Everything which the Government does requires more time, men, and money than like things done by private enterprise. Public ownership would tend to eliminate discrimination because of the absence of the motive to get the most freight possible for an individual road. But it would give to the President the power, directly or indirectly, of appointing 900,000 employees in the service of the railroads and would enable him to practically perpetuate himself in office, would subvert the system of government, and destroy public liberty. (317.)

Mr. COWEN, of the Baltimore and Ohio, believes that Government ownership would be "sublime folly." He refers with approval to the opinion of Mr. W. H. Mallock, that labor is very greatly benefited by the ability employed in the management of capital. Labor, in the sense of manual work, is not the chief producer of wealth. Private ownership of capital, and of the rewards for its management, is necessary in order to stimulate men of ability to their highest effort. Government ownership would destroy the motive of private gain, which is essential to successful business. (319, 320.)

Mr. MOUTON, vice-president of the Atchison, Topeka and Santa Fe Railway, thinks that Government ownership would necessarily greatly increase the expense of railway management. Rates in this country under private ownership are lower and the service better than where the Government owns the roads. The post-office is perhaps the most extravagantly managed business in the country, and most people are not aware of the large annual deficit. Moreover, political difficulties would result from Government ownership. There would still be a tendency toward discrimination, especially between different sections of the country and under party influences. There would be difficulty in adjusting rates in accordance with changing conditions. (492, 497-499.)

Mr. SPENCER, of the Southern Railway, believes that there would be no necessity for discrimination between individuals or places under Government ownership, although it would require strong action of the Government to prevent undue modifications of rates at the demand of different sections of the country. Government ownership would probably result, on the other hand, in undue rigidity of rates as regards commodities, in view of conditions of business and competition.

It would also prevent rapid improvement in facilities. German railways, for example, have nothing like the promptness, efficiency, or luxury of American lines. The introduction of politics also would be a great evil.

The experience of the States of this country in building and operating railways has been very unsuccessful. Georgia long ago leased its railroad, preferring that to direct management. North Carolina still operates one railroad, but unsuccessfully. The Cincinnati Southern Railway, built by the city of Cincinnati, has finally been leased at a rate \$100,000 less than the annual interest. The cost of construction was enormous, and for twenty-three years it has not earned interest. (279, 283, 284.)

Mr. INGALLS, of the Chesapeake and Ohio, is of the opinion that railways owned by governments have never been managed as well as those under private ownership. The United States has astonished the world with its transportation facilities. (299.)

Mr. RIPLEY, president of the Atchison, Topeka and Santa Fe, would not object, as a railroad man, to Government ownership of the roads, but would be sorry to see it as a citizen. There would be a considerable saving in the stoppage of the waste which is incident to all competition. "But governmental methods, as we know them, and as applied to governmental affairs now, would result in a very large deficit in the operation of railroads, unquestionably. The influence of politics and politicians on the railroad business would be, I think, exceedingly disastrous, and any elective officers who were in a position to influence the policy of the railroads, and who would also be desirous of pleasing their constituents, would find the two things irreconcilable. Everybody would want a branch railroad and everybody would want as many trains as possible on it, whether they paid or not, and the price of the election of a Congressman or Senator would be his ability to get things out of the Government in the way of transportation."

Mr. CALLAWAY, president of the New York Central, thinks that Government railways would have to be managed by experts in the railway business, and that methods of fixing rates, etc., would not be materially different from those at present. The railways would become a dangerous political factor. Government ownership has never been a great success—it was abandoned in Canada—nor does the witness understand where the money would be obtained to pay for the railroads. (239.)

Mr. STICKNEY, of the Chicago Great Western, thinks that even under Government ownership railway rates would have to be fixed strictly along the line of what the traffic would bear, just as Government taxes are fixed in practically the same way. The maximum revenue rate would have to be ascertained and then enforced. (464.)

C. Experience of other countries.—Mr. LEWIS states that in Germany the government-owned railroads paid a net profit of \$119,000,000 in 1890, and that the net profit of the German system has increased 41 per cent during 10 years. One may ride 4 miles third class in Germany for a cent, and 10 miles for a cent on the Berlin road. In Belgium, under government ownership, fares and freight rates have been reduced one-half and the wages of employees have been doubled. In Australia one may ride 1,000 miles first class for \$6.50, and workmen may ride 3 miles for a cent. In Siberia workmen ride at the rate of \$6 for 2,000 miles. Mr. Lewis quotes Professor Ely as stating that every man he met in Germany considered the test of experience as demonstrating the superiority of public ownership, and that "even those who were once bitterly opposed to the undertaking are now convinced of their error, and no one wishes to return to private ownership." (747, 748.)

On the other hand, several witnesses declare that American passenger rates average as low as those abroad, and that the service is superior, while freight rates are lower here than in any other country. See under "Reasonableness of rates," pp. 41, 101.

Professor SELIGMAN states that only one country in Europe, Prussia, has made a change from private ownership to public ownership of railroads. In Belgium and also in Australia the Government railroad systems are being greatly extended. Even in Australia conditions are somewhat different from those in this country. The drift toward governmental aid and interference in Australia has always been greater than here, because of the economic conditions. Australia is a vast arid table-land, where nature is not bountiful and where an individual can scarcely cope with the difficulties of nature; the people have always had to have the aid of the government to develop the country. In this country, the most fruitful on the globe, the people have always thought that they could develop the country most by depending on themselves. (613, 614.)

Professor Seligman believes the government ownership of railroads in Germany

to be desirable, although it would be undesirable in the United States. This is partly due to the difference between the governmental service of the two countries. It is partly due also to the fact that the private railways of Germany had always been accustomed to far greater governmental interference than we have had. The German government officials were always accustomed to consider questions of rates and tariffs. The capital invested in railroads per mile is 2 or 3 times as much in Germany as in the United States. (614.)

Professor Seligman states that passenger fares in Germany are somewhat less than in this country, though it is difficult to make a comparison, because of the system of first, second, and third class rates. Freight rates here are very much lower, because of our long-distance traffic. The public patronage of the railroads on the continent of Europe is much less than in America. The reason is that the social conditions in many regions are still almost medieval and the peasants travel very little. It is mostly for this reason that Australia and Hungary have so greatly reduced their passenger fares under the zone system, in order to stimulate intermunicipal travel. (614.)

Professor Seligman says also that Prussia is a very peculiar and exceptional country in respect of the standard of its civil service. In Prussia there is a successful income tax; no one who realizes the differences between political conditions in Prussia and the United States would dare to state that an income tax would be as successful here. In Prussia, and to a certain extent in France, the very best men go into public business and administration. The witness hopes the same will be true in this country some day; possibly the assumption by the Government of more work may lead individuals to be willing to sacrifice themselves for public good. At present, however, men of the highest order of business ability can in general be secured only by higher pay than our democracy is willing to give to public officers. It is probably true that the Government can get the same talent cheaper than a private corporation. There are well-known instances of men who have left more remunerative private work for comparatively small-salaried Government positions. These are, however, often men of independent means; and there are numerous instances of men quitting Government service because of small salaries. (613.)

D. Public opinion as to Government ownership.—Mr. GALLAGHER thinks there is a very dangerous tendency toward Government ownership throughout the Western country, and that the feeling or theory has grown very greatly within recent months. The people feel that they are not justly dealt with: are not getting what is due them. They see that they can buy a postage stamp as cheap as anybody can; can go through the custom-house as cheap as anybody can; and are getting around to the idea that they could go to the station agent's office and buy a railroad ticket as cheap as anybody if Uncle Sam had control of it. The dissatisfaction comes not from high rates, but from unequal rates. He thinks that the greater desire for Government ownership in the West than in the East is perhaps caused by the greater discriminations in the West. (545.)

Mr. DICKINSON says that there is some sentiment in his State—Wisconsin—in favor of Government ownership of railroads. He would not say that it is a general sentiment, but it is greater than it was two decades ago, and possibly greater than it was one decade ago. It does not arise, he thinks, from a desire of ownership, but from the belief that the public is not fairly treated by the railroads. If shippers were to understand that the Interstate Commerce Commission would absolutely put down all discriminations, it might be that the sentiment in favor of Government ownership would be considerably weakened. Government officials themselves might discriminate, though the witness would not expect such action generally. (553.)

E. Municipalization of street-railway service.—Professor SELIGMAN, applying his three criteria of the desirability of government ownership to the question of municipal ownership of street railways, says that the complexity of management of the street railways is far less than in the steam railways, but is greater than in the telegraph or waterworks. The capital invested is tremendous. For that reason, chiefly, but also because the methods of street railway management have been revolutionized within a few years, and in another 5 or 10 years may be revolutionized again, he thinks that the safer plan for the present is governmental regulation rather than governmental management. Everybody is agreed, however, that the relations between government and the street railways—honorable, straightforward relations—have not been as close as they should be. (617.)

F. Government ownership of the telegraph.—Professor SELIGMAN considers that upon the basis of his three criteria of the desirability of government ownership, namely, widespread social interests amount of capital invested, and complexity

of management, the argument for Government control of the telegraph is substantially as strong as for Government ownership of the postal service. (1) Unfortunately in this country the telegraph is not used by every one; but this is because the charges are so much higher and the facilities so much less than in other countries, where the telegraph service is managed by the Government. (2) As regards the capital invested, the requirements, though greater than in the case of the post, are yet very small as compared with other interests. The cost of putting up poles and stringing wires is relatively slight. If the existing companies were bought out there would be a capital outlay, but even then it would be insignificant when compared with the capital invested in ordinary enterprises or the means of transportation. (3) As to complexity of management, while the telegraph makes possibly a somewhat higher demand than the postal service upon the skill of its managers, and while somewhat more effort is required to keep the service up to the level of the advances of science, the business is yet very simple as compared with others; for instance, with the railroads. The great end of individual initiative in industry in general is to turn all ability toward the reduction of cost by inventions, etc. Experience shows that "even such sleepy administrations as those of France and of England" keep the telegraph service on a level with new inventions. That the post is a public service with us and the telegraph is not is an historical accident, due to the fact that the telegraph was not invented until 1844, and that the postal service grew up in the seventeenth and eighteenth centuries. If the postal service had not been in the hands of the Government in the colonies and in the time of Hamilton we should have had the same discussion of Government posts *v.* private posts as of Government telegraph *v.* private telegraph. (610-612.)

Professor Seligman says that in every other country in the world, including the most advanced democratic communities like Switzerland and Australia, the telegraph is in the hands of the government. It was practically in Government hands in our own country when it was first established in 1844. The Government decided not to go on with it, for they thought that it would not amount to anything, and did not wish to commit the Government to a hazardous experiment.

It is probably true that the Government would not make as much money out of the telegraph as the Western Union Telegraph Company makes. Its object would be to make no profit at all, but to run the service just as the postal service is run. Any possible profits would reduce the rates. (611.)

Professor Seligman says that in arguing for government ownership of the telegraph and the telephone he assumes that along with it there would go a very progressive development of our civil service. He does not think there have been any great political dangers in our postal service. If there have been, they have been more than counterbalanced by the political dangers that would have existed if the postal service had been private. The political dangers of government ownership of the telephone and the telegraph are minimized by the fact that the capital invested in them is small. (612.)

Professor Seligman would be in favor of the purchase by the Government of the existing telegraph and telephone systems. He is always opposed to governmental competition with private enterprises. "Although the assumption is that the private enterprise will be brought up to the level of the governmental efficiency, the practical result is always that the governmental agent is pulled down to the level of the private." (612.)

Mr KENTARD, of the Chicago Butter and Egg Board, states that the expense of telegraph and telephone service in the business of handling perishable goods is very great and that the service is far from satisfactory. He refers to the much lower charges in European countries under government ownership, and advocates putting the telegraphs and telephones under the Post-Office Department. In many lines of business the telephone and telegraph service is as important as the mail. At present there is practically no competition between the two great telegraph companies. The charge for messages is made excessive by the payment of dividends on an enormous capitalization. The witness thinks that the opinion of the business men in Chicago generally is in favor of the position stated. (366.)

Mr. FULLER, of Norfolk, Nebr., says that there are constant complaints among the business men of that place concerning the high tolls charged by the Western Union Telegraph Company. He sees no reason why the United States should not control the telegraphs as the leading European countries do. (446.)

Mr. GREELY, a commission merchant of Chicago, is decidedly in favor of a postal telegraph system. He declares that it is a crime for a man to have the right to a private wire, as well as for the telegraph company to give the quotations to bucket shops. (381.)

Mr. SNYDACKER, a grain merchant of Chicago, says that he sometimes finds the telegraph service in connection with his business a little slow and the prices somewhat high. His firm operates private telegraph wires, a privilege which is open to anyone who can pay for it. (400.)

Mr. COUNSELMAN says that elevator men have occasion to use the telegraph very largely in their business, but he considers the rates fair and the service satisfactory. (392.)

G. Public ownership of the telephone.—Professor SELIGMAN says that the arguments for a Government telephone are not quite as strong as for a Government telegraph, because the complexity of management of the telephone is a little greater; yet he thinks that the telephone ought certainly to be publicly owned. On the whole, especially in view of the increased possible use of the long-distance telephone, a national system rather than a municipal system seems to be desirable. England has recently passed a law in accordance with this idea, which will result in the absorption of the entire system by the government at the expiration of the existing company's charter in 1911. The telephone will be a part of the post-office. Almost all European governments, Germany, France, Norway, Switzerland, and also Australia, run the telephone as a part of the postal system. The telephone exchanges should be placed in charge of the local postmasters. (612.)

XII. RAILWAY LABOR.

A. Employment and discharge.—1. *Conditions of entering employment.*—Mr. CALLOWAY, president of the New York Central Railroad, testifies that no tests are made as a condition of employment on that road except willingness to obey reasonable rules and tests of the eyesight and hearing for persons required to take signals. Men are discharged or suspended for various offenses, according to their previous records and to the seriousness of the offenses. No restriction is put upon membership in organizations.

The use of intoxicating liquors on the road or about the premises of the company is strictly prohibited, and no one will be employed or retained who is known to be in the habit of drinking intoxicating liquors. Men are not discharged for occasionally taking a drink, but are not allowed to operate trains if intoxicated or known to be habitually intoxicated. (217, 218, 221.)

Mr. CLARK, grand chief of the Railway Conductors, says that railroad companies are becoming more rigid in making physical examinations of applicants for employment. In many cases they refuse employment simply because a man has lost a finger or has been otherwise slightly crippled, without being in any way incapacitated. The reason for this is said to be that men have sometimes secured employment and then claimed damages for imaginary injuries on the strength of previous disablement. This, however, can not be a sufficient reason, since at the time of entering the service a record is made of all such existing disabilities. (111.)

Mr. ARTHUR, grand chief of the Locomotive Engineers, believes that some of the examinations of applicants for engineers' positions recently conducted have been unjust in excluding experienced men because of alleged defects in sight or hearing. (119.)

Mr. CLARK says that some railway companies have recently established the custom of refusing to employ new men as brakemen or firemen who are beyond a certain age, ranging from 28 to 40. Their purpose seems to be to relieve themselves of the obligation of caring for a large number of men who have grown old in the service without having rendered them an extended period of service. The practice also is likely to influence employees to be less independent, making them very careful before leaving a position. It must have the effect of checking the best young men from going into railway work. (110, 111.)

Mr. ARTHUR has heard complaints, only indirectly, that some railway companies refuse to employ men who are over 45 years of age. He has never known of a case of a man being retired at that age. (119.)

On the Chesapeake and Ohio, according to Mr. INGALLS, no man who drinks while on duty is retained, and young men who drink while off duty are not promoted and are continually watched. The railway brotherhoods are the most effective influences in enforcing temperance. (292.)

Mr. SPENCER says that on the Southern Railway no man who habitually uses liquor is employed in train service. (264.)

2. *Discrimination against union members.* (See also p. 142.)—The chief officers of the respective orders of Railway Conductors, Locomotive Engineers, Locomotive Firemen, Railway Trainmen, and Railway Telegraphers, in reply to the inquiries of the Industrial Commission, declare that the right of a railway employee to hold membership in any reputable organization should be inalienable,

and that there should be swift and severe punishment for discrimination against members of organizations. However, it is only the action of a few railway managers which makes such legislation necessary or desirable. (760.)

Mr. ARNOLD, of the Locomotive Firemen; Mr. WILSON, of the Railroad Trackmen, and Mr. RONEBUS, of the Railway Carmen, express similar opinions in their answers, favoring strict legislation. (763, 765, 768.)

Mr. MURPHY, an attorney at law of Denver, declares that the provision of the act of June 1, 1898, which prohibits discrimination against members of labor unions in seeking employment upon railways, as well as the similar statutes of many States, are in practice violated with impunity. The witness declares that there is one trunk line running west from Chicago which maintains a large detective corps for the purpose of ascertaining whether employees become members of labor organizations, and that a convenient time and excuse are soon found for discharging those who are members. On the other hand, the greater number of railways have no opposition to the brotherhoods. Mr. Murphy suggests that it be made criminal to procure or furnish evidence concerning employees' membership in labor organizations. (777.)

Mr. ARTHUR, of the Locomotive Engineers, says that soon after the centennial of 1876 the employees of the Reading Railroad asked for higher wages, but were met with the demand that they all resign their membership in the railway brotherhoods. By unanimous vote they refused to do so and struck, and their places were filled by other men. This opposition of the Reading system to brotherhood men has continued ever since. Under the receivership of Mr. McLeod, however, one man who had been discharged on account of membership in a brotherhood was reinstated when it was shown that he had not signed the agreement that he would not join any labor organization. (123, 124.)

As to this case, Mr. MOSELEY, secretary of the Interstate Commerce Commission, says that some time ago the receivers of the Reading Railroad revived a former regulation, which had become a dead letter, requiring all employees to drop their membership in labor organizations. A representative of the brotherhoods, Wilkinson, brought suit against the receivers, but the court maintained that the employees themselves must appear, in spite of the danger of being discharged and blacklisted. Three of them finally did bring suit, and were discharged, but the court decided that the receivers could use their employees as they saw fit. As a result of this injustice the railway men secured the enactment of a Pennsylvania statute, and the incorporation in the arbitration act of 1898 of a provision, prohibiting such coercion of employees. (36.)

3. *Discharge and suspension.*—Mr. SARGENT, grand master of the Locomotive Firemen, says that railway employees are discharged for violation of rules, responsibility for accidents, insubordination, intoxication, and occasionally for incompetence. Suspension from duty without pay and systems of merit and demerit markings are employed as penalties in many cases. The practice of suspension has often resulted in injustice. Men have been laid off without any cause assigned and with no opportunity for hearing. The railway brotherhoods have secured the adoption of a rule requiring their members to be given a hearing within 5 days after suspension or discharge, and if the employee is shown to be innocent of the charge made, he is to be returned to service and paid for lost time. The length of suspension for different offenses is fixed. (65, 88.)

Mr. CLARK, grand chief of the Railway Conductors, says that the former practice of suspending men for from 10 to 60 days for violation of rules or other offenses has been practically everywhere replaced by what is known as the Brown system of discipline. A record is kept of each man's service. Any offense is entered and may be offset by a certain number of months of good service or by special meritorious acts. When a certain number of demerit marks have been received, dismissal follows. (113.)

Mr. MURPHY, an attorney at law of Denver, thinks that some restriction should be placed upon the discharge of railroad employees. Railroad work requires a high degree of skill, and a person specially trained in one department is not able to fill positions in other departments of the railway or in other occupations. It is to the interest of the railroads and the general public that men should remain in the same line of work. Often persons in positions of superintendence discharge employees out of caprice or for the sake of securing positions for their own friends. It would be well to have a labor court to give hearings to aggrieved employees, although of course railways should not be prevented from reducing expenses. On some roads the brotherhoods have been strong enough to secure contracts that none of their members shall be discharged without a hearing, and this practice has been beneficial both to the employees and to the companies. (778.)

The chief officers of the leading railway orders, in a joint reply to inquiries by the Commission, are disposed to doubt the advantage of legislation regulating the

discharge of railway employees. They hold that the organizations themselves afford a considerable degree of protection against unjust dismissals. (760.)

Mr. ARNOLD, of the Locomotive Firemen, expresses the same opinion. (763.)

Mr. WILSON, of the Railway Trackmen, and Mr. RONEBUS, of the Railway Car-men, on the other hand, think that laws should be passed requiring that good reasons for discharge should be given and that the discharged employee should have an opportunity to state his side of the case before a competent officer of the employer, such as the general manager. (765, 768.)

Mr. WALKER, chairman of the directors of the Atchison, Topeka and Santa Fe Railway, thinks it would not be advisable to regulate the discharge of railway employees by law. Their service is one involving the safety of life and property for which the employer is pecuniarily responsible, so that he must be absolutely let alone in his choice and retention of servants. (772.)

B. Blacklisting.—1. *Existence of the practice generally.*—Mr. MOSELEY, secretary of the Interstate Commerce Commission, says that after the Chicago railway strike of 1894 a large number of employees found it impossible to obtain employment again. To many of them certificates of good character were given by the rail-ways, but by a form of reading or by some secret mark these papers proved to be notices to other employers that the person was blacklisted. As a result of this abuse Congress included in the arbitration act of 1898 a prohibition against attempting to conspire to prevent any employee from obtaining employment. The evil is one which it is difficult to prevent, evasion being easy, and the witness has no suggestion to make for strengthening the law. (8.)

Mr. CLARK, of the Railway Conductors, says the practice of blacklisting was formerly common. The witness knows of one case in Florida where a conductor was offered a better position on another road. His own road kept him as long as possible, not desiring him to make the change, and, when he had taken the new employment, sent a letter to the other road advising that he be not employed, so that he was afterwards discharged. The abuse has been greatly reduced by legisla-tion. The practice now is for railway companies to give men who leave the service a letter stating what their service has been and the reason for leaving it. Very often the reason is stated to be "unsatisfactory service." The witness has known of one instance where an employee received a letter of high commenda-tion, but was at the same time on the blacklist. He has heard rumors that let-ters themselves are sometimes marked so as to indicate that the man should not be employed. (112.)

Mr. SAUGENT, of the Locomotive Firemen, says that this practice was formerly very common, but has largely been done away with by laws. It is now the custom to require men entering employment to submit a statement of their former employment, and their former employers are then asked for information. This practice has the same effect as the old blacklist. Many companies furnish their employees statements of their service when they leave. The trade unions have had a strong influence in preventing unreasonable dismissals. (65.)

Mr. WILSON, secretary of the Locomotive Firemen, thinks a majority of rail-ways have some understanding among themselves, by which all employees who have been discharged are required to present to any other road a letter as to their competence from their immediate superior in the previous employment. The witness has been told that there are certain private marks by which it is known whether such letters mean what they say or the opposite. (52.)

Mr. ARTHUR, of the Locomotive Engineers, does not know from personal knowl-edge that engineers have been blacklisted. He has been told by men that they have been discharged after a few days of work under a new employer, and they have attributed this to some notice received from their previous employer. Dur-ing the strike of 1894 those who left employment were given letters as to their service, but the date of these letters being the same as that when the strike was begun they served to prevent their holders from securing employment. The Philadelphia and Reading Railroad has at various times refused to employ union men, and has been accused of blacklisting them. (123, 124.)

Mr. STRONG, an attorney at law of Chicago, says that he has evidence of the continuance of the practice of blacklisting up to within 3 or 4 months of the time of his testimony, November 22, 1899, and that the system extends to all the principal railroads in the United States and even down into Mexico. (524.)

Mr. COWEN, president of the Baltimore and Ohio Railroad, says that it is the practice to suspend men for various offenses for periods varying according to the nature of the offense. The railway does not exchange blacklists with other roads, although possibly this may have been the practice earlier. Mr. Cowen does not know whether the divisions are always notified of the discharge of men from other divisions. (303.)

Mr. SPENCER, president of the Southern Railway, testifies that on that system lists of men discharged are kept, but these lists are not exchanged with other companies, since there is no reason for pursuing a man, or undertaking to decide for others whom they shall employ. The practice, Mr. Spencer thinks, is dying out. (264, 265.)

Mr. INGLIS declares that on the Chesapeake and Ohio blacklists are not exchanged with other railroads. If one division of the railway discharges a man no other division can employ him without the consent of the general manager. (288.)

Mr. WALKER, chairman of the directors of the Atchison, Topeka and Santa Fe Railway, declares that blacklisting is largely an imaginary grievance, and that if a servant is unfaithful it is not only the right but the duty of the master to tell the truth upon inquiry. (772.)

2. *Chicago strike.*—Mr. STRONG believes that the idea of blacklisting first took form among the railroads centering in Chicago in 1893. The General Managers' Association of Chicago, which embraces 24 roads, appointed a committee which made a report on May 18, 1893, containing the following clauses:

"The matter of the establishment of an employment bureau: The subject has been discussed at great length, and it is the opinion of the committee that such a bureau would be of advantage to the association—

"First. In assisting them in the procurement of men, both under ordinary conditions and in times of emergency.

"Second. In assisting the roads to guard against the employment of a man who has been proved unworthy on some other road.

"Third. In abolishing the state of affairs with which we are all familiar, that is expressed, when a man is disciplined, by the statement that 'your road is not the only road in Chicago,' and that 'employment can readily be obtained on some other road,' although an offense has been committed."

Thirteen out of 20 railroads present voted to adopt it, but the rules of the association provided that whenever any scheme was proposed which required any expenditure of money, as this did, it should not take effect unless the vote was unanimous; so it was defeated. During the strike of 1894, however, a plan which had the same effect was adopted. Mr. John Eagan was selected to take charge of the whole strike, and to get employees for all of the different railroads.

Mr. Strong says that the association's committee disclaimed the idea of blacklisting, but this very disclaimer seems to him to show that they were conscious that their proposition meant nothing else. There had been growing friction between the railroads and their employees, resulting largely from the workings of what the association's committee calls "discipline." By discipline Mr. Strong understands the system of suspensions and fines for sundry offenses, often, he says, of a trivial character. Frequently, in Mr. Strong's opinion, discipline fell upon the wrong man, and frequently it was unjustly severe. (503-505, 510.)

Mr. STRONG states that his attention was called to blacklisting in the fall of 1895. He was then called suddenly into the case of Fred R. Ketcham against The Chicago and Northwestern Railroad Company. Becoming deeply interested in the matter, he put an advertisement in the Chicago Evening News, asking any men who thought they had been blacklisted to come to his office and make their statements to him, and bring such letters as they had that they thought were evidence of the blacklisting agreement. Mr. Strong received 500 statements with letters corroborating them. In June, 1896, he filed some 50 cases, including some against nearly every railroad in Chicago. Mr. Strong gives in some detail the experience of a considerable number of the strikers of 1894, or of men who were denied work on the ground that they had sympathized with the strikers. The case of Mr. Ketcham, who brought the first suit, is typical. Mr. Strong's statement of his case is as follows: He testified that he quit the employment of the Chicago and Northwestern Railroad Company during the railway union strike, and remained at home, not going near any railroad during the trouble; that about July 3 of that year Superintendent J. C. Stuart came to his house and asked him to take out a train; that he refused, as he considered it dangerous; that he was not at this time a member of the American Railway Union, but afterwards joined it about July 20; that he had been in the employ of the defendant company about 10 years; that upon his refusal Stuart "threatened him with arrest, adding that he had sympathy for his family, and that if he did not take out the train he would find hard work getting a job from any other road." Having heard of the black list, he went to the Chicago Great Western Railway and secured a situation as conductor of one of its freight trains July 28, and made one trip to Dubuque, Iowa, and back, arriving home July 31, at 5; that at 7 he was arrested by a United States marshal and kept in custody several days until he could give a bond

for \$3,000, but was never prosecuted, no evidence being offered against him; that August 6 he went to Superintendent Stuart and asked him for a clearance, and was given a letter showing how long he had been in the employ of the Chicago and Northwestern, but at the bottom was the following: "Left his post during American Railway Union strike and was active in persuading others to do likewise. When he returned for duty his place was filled."

On the same day he returned to the Chicago Great Western for duty and was told by Train Master J. B. Strong and Superintendent J. A. Kelly that he was discharged, Superintendent Kelly telling him that he was a good man and he would like to keep him, but could not unless he first obtained a "clearance" from the Northwestern. When asked why he was discharged Kelly said, "Because he had heard he was a Northwestern striker." Ketcham then asked where he got his information, and Kelly replied, "From the one we all get it from." Ketcham then asked if he was blacklisted, and Kelly replied, "You can call it that or anything you're a mind to. I can't put you back to work unless you bring a 'clearance' from the Northwestern. I am sorry, but it comes from above me."

The following facts also appeared from Ketcham's testimony: After being discharged from the Chicago Great Western he applied to several other roads for employment, but was everywhere refused, and never secured railroad employment after the strike. In the autumn of 1897 he worked as stationary engineer at the Michigan Central Railroad elevator at Kensington, but was discharged about 2 weeks before the trial, for the alleged cause that business was slack, though the elevator was running full time, and continued to do so after his discharge just as it had been doing previously.

About 35 other men who had quit various roads during the strike testified that they had applied to all the roads in Chicago, were told the roads needed men, but were denied employment because they did not have "clearances." The clearance was a letter from the road which the man had last worked for, giving a full statement of his record. The essential thing seemed to be an assurance that the man had not taken part in the great strike. The railroad managers admitted that they were in the habit of writing to each other for the record of men who applied to them for work. This appeared in repeated instances in which men had at first been employed and were afterwards discharged, admittedly without any fault in their services. Sometimes they were made to sign a formal application for employment and, although temporarily given work, were afterwards discharged with a statement that their applications had been rejected. The rejection was stated, in some instances, to be due to information that the men had participated in the strike. The railroads denied that there was any actual blacklist, or list of men to whom employment was to be refused. A messenger boy in the office of the superintendent of terminals of the Illinois Central Railroad, however, testified that he was instructed to make 50 mimeograph copies of a list of 524 names; that he addressed and mailed 49 copies of this list, 1 to each official of the Illinois Central Railroad who hired men, and 1 marked "private" to every railroad in Chicago. A copy of this list came into Mr. Strong's hands. The messenger boy's testimony seems to have been in some degree corroborated by the statement of the superintendent of the Chicago and Grand Trunk Railway that he saw a copy of the list in the office of the attorney of the defendant railroad. (503-519.)

Mr. STRONG says that out of 30,000 men who went out in the Chicago strike of 1894 only about 31 were proved to have been reemployed, and fully one-half even of these were men who returned to work before July 10, when notified by the railroads to do so, and hence were really not strikers. This statement seems to refer, however, to individual instances proved in court. Mr. Strong says in another connection that a great many were taken back to work after the suits were begun against the railroads, and when the roads saw what damages they were liable to for refusing employment. He knows of probably 50 or 60 men who, finding it impossible to get work under their own names, changed their names and by this means got employment. He elsewhere estimates the number of men who were blacklisted at "fully half of the men who went out here." He also mentions that Mr. W. G. Brimson, of the Calumet and Blue Island road, testified that he had secured work on other roads for a good many of the strikers by leaving out the fact that the men had been in the strike when he answered inquiries about their record, implying that if he had mentioned this fact the men could not have gotten employment. (513, 517, 522-524.)

3. *Is blacklisting justifiable?*—Mr. STRONG says that no one questions the right and duty of the railroad to report to another the name of a drunken or careless employee, as the public is interested in having sober and careful men operate the trains. But if railways combine to keep men from work simply because they have struck to better their condition, though they have violated no

law, such an act is unlawful and dangerous to the public welfare. The men do not complain that they lost their old positions. They complain that their old employers vindictively pursued them and prevented them from getting employment elsewhere. If a man who quits the employ of another can not get work in his chosen occupation without obtaining his former employer's consent, he becomes a slave. He will not dare resist any oppression his employer may see fit to impose upon him, because he knows he can not leave and get employment elsewhere. Mr. Strong believes that it is the purpose of the railroads to reduce their men to this condition, and that the employees of the railroad companies are to-day absolutely terrorized. He says that men who were in the strike of 1894, and who are now employed, have told him that the punishment and suffering of the men who went out during the strike have been so severe that they do not dare to form another union or present a grievance, for fear of being discharged and blacklisted; that they are burdened with extra duties and dare not complain. The objection of the railroads seems to be especially against the heads of the union. To strike at the heads of the union is to destroy the union. If they are to be singled out and punished, men will hesitate before accepting these positions. A railway vice-president recently said to Mr. Strong, "The people who own this country propose to run it," and he explained that by the owners he meant "those who own the property." Mr. Strong believes that the course of the railroads has been dictated by the feeling and intention which this man expressed.

Mr. Strong considers that political bondage as well as industrial bondage must result if employers are permitted to exclude men from work for taking part in strikes or other efforts to better their condition. No man can be a proper elector who is afraid to assert his rights, and it will come to pass, if it has not already, that the workmen will not dare to exercise the elector's franchise according to their own will. Moreover, to exclude a man from means of honest livelihood is to make him a criminal or a pauper. It is in the highest degree required by the public interest that every man be given an opportunity to work in that calling in which he is skilled. (513, 514, 516, 518, 521, 523.)

Mr. O'ROURKE, switchman, of Chicago, thinks that a system of blacklisting is now in use by the railroads, but does not think that it works against the laboring man. It tends to place a premium on good character, good conduct, and good service, and to shut out those who are not worthy of employment. In an individual case it might be an evil system, in enabling railroad officials to shut out a man against whom they had a grievance from employment on any other road, and it is true that the situation has been more disagreeable in Chicago than elsewhere; but considering the whole body of employees in the United States he believes the system works well. Mr. O'Rourke apparently considers agitators to be among those who may properly be excluded from employment. He says that the switchmen's union is demanding that men making application for membership "must show as good a character as any railroad company has ever asked of any man." "In the growth of the organized railway labor to-day no shelter is being given to the agitator." To have been actively engaged in the strike of 1894 is a reason for exclusion from Mr. O'Rourke's union. (528, 529.)

4. *Remedies for blacklisting.*—Mr. STRONG considers that there is only one way to settle the contest between labor and capital regarding public transportation. He thinks it will be necessary for the Government to take control of the railroads and put the men on the civil-service list. In the absence of Government ownership he would make blacklisting a felony, punishable by imprisonment of the officers who may be concerned in it. To permit the blacklisting of those who may have done unlawful acts in furtherance of a strike would be to make any law against blacklisting entirely ineffective. It is very easy to trump up some charge of an unlawful act. Besides, such permission of blacklisting is wrong in principle. A man ought to be punished according to law for any unlawful act he may do. He ought not to be starved to death as a punishment. (523.)

The grand chiefs of the leading railway orders in their reply to the schedule of inquiries concerning railway labor favor the enactment of laws with a penalty sufficiently severe to outweigh the desire to violate the law by the secret practice of blacklisting. Existing laws are sufficient to check open blacklisting. (760.) Mr. ARNOLD, of the Locomotive Firemen, expresses a similar opinion (763); while Mr. WILSON, of the Railway Trackmen, and Mr. RONEMUS, of the Railway Carmen, think that the practice is decreasing, and that further legislation will be either ineffective or unnecessary (765, 768).

Mr. MURPHY, an attorney at law of Denver, says that there is great difficulty in getting evidence concerning blacklisting. He thinks that even the practice of giving a statement concerning a discharged employee to an inquiring employer, which has always been permissible at law, is pernicious. The bare statement of

certain happenings or acts of a servant may make him appear an undesirable employee, in the absence of an explanation of the circumstances. It should be made unlawful for any person to furnish a statement to any other employer concerning an employee without first furnishing the employee a true copy. (777.)

C. Wages of railway labor.—1. Rates.—Mr. SARGENT, chief of the Locomotive Firemen, states that the standard rate of wages for passenger engineers is 34 cents per mile; for freight engineers 4 cents; and for firemen 58 per cent of engineers' pay. Freight conductors receive 3 cents per mile, and brakemen two-thirds as much. Passenger conductors receive from \$100 to \$125 per month, and brakemen from \$50 to \$70. Station agents receive from \$40 to \$85 per month, according to the importance of the station; train dispatchers \$125 per month. In the Southern States colored men are employed largely as brakemen and firemen at much cheaper rates. (64, 65.)

Mr. BLANCHARD, late commissioner of the Joint Traffic Association, submitted the following as a comparison of railway wages in the United States and Europe:

| Country. | Per day. | | Per month. |
|---------------------|----------------|----------------|-------------|
| | Engineers. | Firemen. | Conductors. |
| United States | \$3.65 | \$2.65 | \$82.40 |
| England | \$1.25 to 1.87 | \$0.75 to 1.12 | 30.40 |
| France | 1.00 to 1.16 | .75 to .83 | |
| Germany | .81 to 1.25 | .62 to .81 | 28.30 |
| Belgium | .81 to .90 | .50 to .60 | |
| Holland | .83 to 1.04 | .54 to .72 | |
| Hungary | | | \$2.40 |

Mr. ARTHUR, chief of the Locomotive Engineers, says that the wages of engineers have been materially increased by the efforts of the Brotherhood of Locomotive Engineers. At the time of its organization engineers were paid \$60 per month. Now they receive 34 cents per mile in passenger service and 4 cents per mile in freight service, 100 miles or less in a run constituting a day's work. The wages of engineers were kept up on almost all roads despite the depression of 1893. This fact is, of course, partly due to the practice of paying by the run, since the men actually earned less when there was less business for the railroads. The engineers have little to complain of concerning wages. The wages are the same as have prevailed for the past 15 years, and their purchasing power is greater than before. (117, 127.)

Mr. WILSON, of the Brotherhood of Railway Trackmen, states that roadmasters receive from \$60 to \$150 per month; section foremen from \$1.05 to \$2 per day, and track hands from 47½ cents to \$1.25 per day. The lowest wages are paid in the Southern States. The employment of the track hands is chiefly in the summer, so that many of them are forced to become tramps in the winter. The witness believes that the Interstate Commerce Commission should be given power to aid these men to get better pay. Sometimes railways furnish little houses near the track free of rent to trackmen. The excessive competition of railways, rate wars, etc., are responsible for these low wages. (46, 50.)

According to Mr. CALLAWAY, president of the road, the employees of the New York Central are partly paid by distance traveled, especially in the case of trainmen, and partly by the number of hours of service per day. The average wages are as follows:

Telegraph operators, \$52.50; block-signal men, \$46.50; other signalmen, \$49, which includes baggage-men, station clerks, etc.; engine-men, \$114, although their wages vary from \$90 to \$175; firemen and wipers, \$59, firemen getting from \$50 to \$84; conductors, \$86; baggage-men and trainmen, from \$40 to \$70; mechanics and helpers in shops, \$49; other shopmen, \$40; roadmasters, from \$100 to \$125; track foremen, from \$40 to \$50; track laborers, \$35.50; switchmen, flagmen, watchmen, etc., \$40; mechanics and helpers on road, \$56; employees of floating equipment, \$58. There are no deductions from wages unless the men give orders for payment of rent, board, etc., out of their earnings. (217.)

Mr. SPENCER says that the wages on the Southern Railway are about the same as on the other railways in the South. They are somewhat lower than in the North, but not, as Mr. Spencer thinks, largely on account of the competition of colored labor. Colored labor is not employed for the more responsible positions. Although there is a relatively larger supply of labor as compared with the demand

in the Southern States, this is less true of skilled labor, such as that necessary for many railway positions. The business of the Southern railways is for the most part less complex than in the North, since the traffic is not so dense, and less skilled and less difficult labor is required. The cost of living is also materially lower. (264, 267.)

Mr. INGALLS testifies that about 20,000 men are employed on the Cleveland, Cincinnati, Chicago and St. Louis, and the Chesapeake and Ohio Railroads. The men are paid monthly, clerks and agents by monthly rates, track and shop men on the basis of the hours worked, and trainmen by mileage. The trackmen are paid about \$1 a day. On some roads during 1895 and 1896 the witness thinks that the wages of this class fell to 90 cents, and occasionally to 75 cents. Their hours are long and they may be considered, perhaps, the hardest worked and poorest paid of American laborers. At the same time, they often own their own houses, and their work requires little skill, although Mr. Ingalls admits that considerable responsibility rests upon them. (287, 288.)

Mr. FISH testifies that during the period of great depression, from 1893 to 1897, the Illinois Central Railroad was obliged largely to reduce the number of men employed. It was also necessary to reduce the number of hours of work per day in the shops. The wages, however, were not cut at all. The witness is inclined to think it would have been more for the advantage of the employees if wages had been reduced, since the number of employees and number of hours would not then have had to be cut so much. Thus, the railroad could have employed shop hands in building new cars and engines, but, instead, was compelled to buy a considerable number from manufacturers having lower wage scales. The reason why wages were not reduced was that there was apprehension of strong opposition from the employees, and possibly of a strike. The railway had for years been paying a standard scale. (324-327.)

See also Paragraph L. below.

2. *Methods of fixing wages.*—Mr. ARTHUR says that early in the history of the Brotherhood of Locomotive Engineers the organization began to send committees to the railway companies to discuss wages and conditions of employment. These committees would present a statement of their demands, and when an agreement had been reached it would be put in form and signed by both parties. In this way grew up the system of fixing wages by joint agreement or contract, which now prevails in the case of about 90 per cent of the railways. Such agreements are indefinite in their duration and may be terminated on from 30 to 60 days' notice. The railways have practically never violated them, but the employees did so at the time of the Chicago strike of 1894. (117, 127.)

Mr. SARGENT states that the wages of railway trainmen and telegraphers are mostly fixed by joint agreement between their organizations and the railways. Approximately uniform rates exist in the North Central States. Payment is by the mile in freight service, and usually by the month in passenger and station service. (64, 65.)

Mr. Sargent says also that trainmen are usually paid for overtime on a fair basis, but in many cases telegraphers and yardmen are not, although working more than 12 hours. Sunday work is paid at the same rate as other work. (66, 86.)

On the Baltimore and Ohio, according to Mr. COWEN, the train hands are paid by the miles run. Overtime is allowed for excess mileage or for work after 12 hours in case the trainmen are unable to get their trains over the required distance within that time. There is no extra compensation for Sunday work. Trackmen and similar employees work 10 hours daily. (303.)

3. *Influences affecting wages.*—Professor JOHNSON says that the rate of wages on railways has been found in Europe to vary according to the rates for other occupations in the same locality, and presumably the same is true in this country. Anything which affects the earning power of the railway is likely to influence wages. The losses due to ticket brokerage, and the necessity of paying dividends on watered stock, are both likely to reduce wages. (60.)

Several witnesses suggest that whatever affects railway rates unfavorably is likely to injure the employees. See pp. 39, 95.

D. *Hours of Labor.*—1. *Duration generally.*—Mr. SARGENT, of the Locomotive Firemen, says that trainmen have little occasion for complaint as to hours. Telegraphers and yardmen, however, often have to work 12 hours per day, and are not always paid overtime for longer hours. Ten hours is the day for trainmen. If a locomotive fireman makes a 100-mile run he is counted as having worked a full day, no matter how many hours are required. Often in this way he may earn pay for 2 days' work in 1, or for 9 or 10 days' work in a week. Frequently, when there is a rush of business, men are required to work overtime. There are certain rules of the railways and the brotherhoods as to giving a number of

hours' rest after a certain amount of work has been performed, but circumstances prevent even this, sometimes, from being carried out. Special conditions of weather, etc., may make necessary continuous labor for 36 hours or more. The railway managers are disposed to be fair; they pay for overtime. The crowding might be prevented by employing more men to work during the busy season, but this would leave men idle later on, and is opposed by the employees themselves. They prefer to work hard and make extra pay at times, getting more rest with moderate wages at other seasons. The hours of firemen used to be much longer than at present; even after the organization of the brotherhood they were formerly 12, but now the limit is 10 hours, wherever the length of time determines the day, except that hostlers usually work 12 hours per day. (66, 86-88.)

Mr. CLARK, chief of the Order of Railway Conductors, says that it is difficult to state the average number of hours worked by conductors. They are considerably shorter than a few years ago, because of the more rapid transportation of freight, although in some cases there is a disposition to require conductors to run longer distances than before. During a rush of business, hours are sometimes excessive, since railway companies do not wish to put on new men, especially on account of the possibility of accident. The companies, however, do not desire to work the men beyond their physical capacity, and it is the general rule that men who have been on duty for 16 hours may demand at least 8 hours rest. (110.)

Mr. WILSON, chief of the Railway Trackmen, states that on some railways the required hours for trackmen are 10 or 11, while on others they are from daylight to dark. Laborers are paid for overtime, nights, and Sundays, but foremen are not. The hours should be shortened by adding more men. (50, 51.)

Mr. CALLAWAY says that, on the New York Central, station employees are sometimes necessarily employed for very long hours, although during much of the time they have little or nothing to do. Telegraph operators are not required to work more than 12 hours, and in some signal towers where many levers are used 8 hours constitutes a day's work. On passenger trains the hours average less than 10 per day. In freight service they are sometimes 12 hours during the 24, but the men receive sufficient rest before another run. (218.)

Mr. INGALLS testifies that on the Chesapeake and Ohio and the Cleveland, Cincinnati, Chicago and St. Louis the outside limit of labor is 10 hours. This is the usual requirement for track labor. Shopmen more often work 9 and even 8 hours. On passenger trains the hours are not usually over 5 or 6 and sometimes less. Freight runs are scheduled at 8, or more often 10 hours. The purpose is to arrange the divisions of the railway so that good wages can be made by going over the division on a mileage rate. (287, 288.)

Mr. SPENCER says that on the Southern Railway the hours vary according to the service. Laborers ordinarily work longer than trainmen. The outside limit for engineers is 12 hours, and they often work much less. (265.)

2. *Proposed legal regulation of hours.*—The chief officers of the leading railway brotherhoods, in their joint reply to a schedule of questions, declare that it is impracticable to fix arbitrarily the hours of labor of train and engine men on account of the necessity of changing crews only at established points. The hours of labor of yard and office men should be shortened; for train dispatchers and yard employees 8 hours should constitute a day. For all other classes 10 hours should be recognized as a day's work, and there should be extra pay for extra hours. (761.)

Mr. WILSON, of the Railway Trackmen, thinks that those not engaged in operating trains should not be required to work more than 8 hours except in cases of emergency, believing that they become more fatigued in that length of time than men on trains would during 10 or 12 hours. (766.)

Mr. KONEMUS, of the Brotherhood of Railway Carmen, thinks that in every department 8 hours should be the maximum day's work. In most cases of shop work men would perform as much work in 8 as in 10 hours. The only reason why there is not more agitation for shorter hours is the fear of reduced wages. (769.)

Mr. ARNOLD, secretary of the Locomotive Firemen, thinks that Federal legislation regulating the hours of continuous labor is desirable, especially for the sake of promoting safety. (763.)

Mr. MURPHY, an attorney at law, of Denver, declares that on account of the exacting and exhausting character of railway work it is for the interest of the public that no man should be permitted to be on duty more than 12 hours out of 24 in train service, while in yards and machine shops, where the service will not be impaired by one set of employees relieving another, 8 hours should constitute a day's work. Reduction of the hours of labor will raise the standard of health and of character. (779.)

Mr. WALKER, chairman of the directors of the Atchison, Topeka and Santa Fe Railway, on the other hand, declares that legislation concerning hours of labor is unnecessary. At present, overtime is paid for under duly established schedules. When trains are delayed it would be impossible to tie them up at a stated hour. Cases where employees are overworked are very exceptional. (772.)

3. *Sunday labor.*—According to Mr. SARGENT very little Sunday work on railways is done in the New England States, although perishable freight and some passenger cars are carried. In other parts of the country also there has been a marked decrease in Sunday work during recent years. The railway managers are disposed to do as little of it as possible, but the public insists on a certain amount of passenger traffic, and perishable freight, live stock, etc., must be transported. The railway brotherhoods have all taken a stand against Sunday labor, but recognize the necessity of a certain amount of it. Whether the employee who works on Sunday will get a day's rest during the week depends upon the amount of business. At present he is not likely to do so. Sunday work on railways should be abolished as far as practicable. At present it is paid for at the same rates as work on other days. (66, 86, 87.)

Mr. COWEN, president of the Baltimore and Ohio, says that it is the object of the railways to reduce the running of Sunday trains as much as possible. At the same time it is more economical to use the plant 7 days a week than 6, and in any case it is impossible to stop Sunday work altogether or even any large part of it. Through freight moves on Sunday much as on other days, but the fact that the stations are practically shut on Sunday curtails local business especially.

In the States where the operation of trains on Sunday is limited by law, practically no attention is paid by the Baltimore and Ohio to the statute. There have been some complaints, especially as to the running of excursion trains, but no prosecutions. (303, 304.)

On the Chesapeake and Ohio, according to Mr. INGALLS, only train men work on Sunday. They receive the same pay as for other days. It is unwise for any employer to work his men more than 6 days in a week, but nevertheless laws prohibiting the running of trains on Sunday are injurious. They often injure shippers, and prevent men from reaching their homes for Sunday. The Virginia law permits perishable freight to be carried on Sunday, and Mr. Ingalls admits that frequently on his road long trains of coal cars are run through with single carloads of hogs to legalize the traffic. (388.)

Sunday labor on the Southern Railway, according to Mr. SPENCER, its president, is not paid for at higher rates. Many local passenger trains are not run on Sunday, but through trains must be. In Georgia and one or two other States the running of freight trains except for perishable freight is prohibited on Sunday. Such laws are, Mr. Spencer thinks, exceedingly injurious. It is the desire of railways to move as little freight as possible on Sunday, but if the freight must absolutely be stopped at a fixed hour it may render necessary additional facilities, yards, etc., and it tends to keep the men away from home over Sunday oftener than if no such law existed. Trains having only a small quantity of perishable freight along with other cars are sometimes run. This is in a certain sense an evasion, but if the railways were not permitted to haul other cars along with perishable freight they would often have to refuse to haul perishable freight altogether. (265, 266.)

Mr. CALLAWAY, president of the New York Central, says Sunday labor is necessary for part of the freight crews, especially on account of perishable freight. The pay for Sunday work is the same as for other days, by the mile. In the case of some passenger employees who have to work more than two Sundays during the month the pay is double for such extra Sunday work. Dead freight is usually allowed to lie over from morning to night on Sunday. (218.)

E. The railway brotherhoods and orders.—1. *Relations to one another.*—Mr. ARTHUR, Chief of the Locomotive Engineers, says that the various railway brotherhoods, except the Locomotive Engineers, have formed a federation. The question of joining this federation was thoroughly discussed by the Engineers and defeated. The witness maintains that it is undesirable for engineers to delegate authority over their actions to conductors, firemen, and others. Moreover, the public will cease to consider the separate brotherhoods as individual organizations, and will look only to the federation. The avowed aim of the federation, to coerce railways into submission by the threat of general strikes, is not approved by the witness. The policy of his organization has been to cultivate friendly relations with employers, not to coerce them. (122.)

2. *General organization of brotherhoods—Locomotive Engineers.*—Mr. ARTHUR says that this body was organized in 1863, with the object of promoting the interests of locomotive engineers generally. It now includes about 90 per cent of all

the engineers in the country. The organization sought almost from the beginning to protect its members and secure better conditions from employers, a thing which was not attempted by other railway brotherhoods until much later. Its chief purpose, however, was to improve the character of its members, check intoxication, etc., and its influence in this direction has been very important. (116-118.)

For the central organization of the brotherhood the dues are \$2.50 per year, in return for which the members receive the monthly journal. From this source and from profits on other printing the organization has a sufficient fund for current purposes, out of which an annual appropriation for charity, amounting last year to \$42,000, is made. There is also an assessment for the contingent fund, to be used in case of strikes. This fund has not been called upon for a number of years, and amounts to about \$100,000. Local lodges have additional dues of from \$1 to \$6 per year. (120, 121.)

Order of Railway Conductors.—Mr. CLARK, grand chief, says that this organization includes at present 22,700 members, of which about 1,500 are in Canada and Mexico. The total number of conductors employed in the United States is about 24,000. The organization has only been active in pushing the interests of employees in labor disputes, etc., since about 1890, and in that time has succeeded in raising wages and reducing hours in many parts of the country, in promoting the independence of its members, and in checking discharges for unjust causes. (110, 113.)

Brotherhood of Railway Trackmen.—According to Mr. WILSON, grand chief, this organization was established about 7 years ago. Till recently only section foremen and roadmasters were eligible, but it is now open to laborers also. The organization as yet, however, includes only about 6,000 of the 180,000 track employees. Its membership is mostly confined to the South and West. It is not associated with the Federation of Railway Employees, which in fact restricts its membership to those employed on trains. Nevertheless the members of the other railway brotherhoods have encouraged this organization. The monthly dues of the brotherhood are 25 cents, while an insurance fee of \$1 is also collected. When a member dies or is totally disabled a payment of \$1,000 is made; for partial disablement, \$500. The slow growth of the organization may be partly due to the practical compulsion of contributions to the insurance funds of some railway companies. (48, 50.)

Switchmen's Union of America.—Mr. O'ROURKE, of Chicago, a member of Switchmen's Union No. 36, states that the membership of that lodge is about 65 or 70. There are 3 or 4 other local unions of switchmen in Chicago. Mr. O'Rourke does not think that a quarter of the switchmen of Chicago belong to the switchmen's union. The total number of switchmen's local unions is 158. The union was reorganized after the strike of 1894, and has had a wonderful growth during the past 5 years. The sick benefits are arranged by the local unions according to their several desires. The union has effected insurance for all its members with a separate organization—the Imperial Mystic Legion—an insurance company doing business under the laws of Nebraska. This arrangement was made in the autumn of 1899. (525-527, 530.)

American Railway Union.—Mr. O'ROURKE considers that a large number of the officers and members of the American Railway Union, especially in Chicago, were professional agitators. He apparently regards the influence of such men as opposed to the interests of organized labor, and considers that the great strike of 1894 was due to evil counsel. Perhaps one-fourth of the present members of Mr. O'Rourke's switchmen's union were among the strikers in 1894. (527, 529.)

Mr. O'Rourke believes that more men who are in active service are members of the various railway unions to-day than at any previous time, even at the time of the greatest strength of the American Railway Union. It was not necessary to be in active service to be a member of that union, and Mr. O'Rourke thinks that one-third of its members were not in active service. This large proportion of unemployed men was due to the slack business of that time, the years 1893 and 1894. (527.)

3. *Purposes, advantages, and effects.*—Mr. MOSELEY, secretary of the Interstate Commerce Commission, declares that the only way by which the workingmen can maintain themselves against great combinations of capital is by thorough organization. Thereby they will be able to preserve their individuality and to improve their situation socially and in the public eye. (43.)

Mr. Moseley has always found the officers of the various railway brotherhoods to be of high character, conservative, and law abiding. They have asked for no legislation which is not justified by humanity and civilization. One of the main purposes of the organizations is mutual insurance. (44.)

Mr. SARGENT, grand master of the Locomotive Firemen, says that the railway brotherhoods are each confined to men in a particular department. Their purposes are to obtain better conditions as to wages, hours, and surroundings, to elevate the profession, to influence legislation, to obtain financial aid for afflicted members and their families, and to furnish out-of-work benefits to members on strike. They have had very beneficial effects. Probably 80 per cent of the employees belong to them. They do not interfere with nonmembers. (68.)

Mr. WILSON, of the Railway Trackmen, says that the railways are easily able to replace men who are dissatisfied unless they are very thoroughly organized. Without organization and public opinion little improvement in the conditions of railway trackmen can be anticipated. Already increases in wages have been secured by organization on 8 or 9 different systems, and reduction of hours on 2 or 3. The railways do not like to oppose the organization directly, but through the road masters they have to a certain degree done so. The organization, however, is doing much to bring closer relations between the road masters, section foremen, and ordinary track laborers. (51, 52, 54.)

Mr. ARTHUR says that one of the chief purposes in the organization of the Brotherhood of Locomotive Engineers was to check the intoxication and vice which were then prevalent among railway employees. In this the organization has been very successful. Application for membership is carefully investigated, and a man must be of good character to secure admission. In 1 year 172 members were expelled for intoxication. The result of this strict system has been that indulgence in intoxicating liquors is now rare among engineers. (116, 117.)

Mr. SARGENT also says that the use of intoxicating liquors is discontinued by the railway brotherhoods in every way, as well as by the rules of many railway companies. It has greatly decreased in recent years. (69.)

4. *Insurance features of brotherhoods.*—Mr. SARGENT testifies that railway brotherhoods make insurance of their members against death or disability an important feature. The amount of insurance ranges from \$400 to \$5,000, and it is furnished on a mutual assessment plan at actual cost. The various brotherhoods have already paid out in round numbers \$20,000,000 for benefits. The Brotherhood of Locomotive Firemen is furnishing insurance at a cheaper rate than any other organization whatever. It has a rigid medical examination. The cost of an insurance of \$1,500 in 1898 was only \$16 per member. The reason for this low cost is that most of the members are young and able-bodied, since, when they become older, they are usually promoted to be engineers. The organization also pays benefits for various disabilities not covered by the other railway brotherhoods. Thus, it pays for the loss of a hand or a foot, for blindness, and during the continuance of consumption, paralysis, or Bright's disease. In the local lodges this organization also provides for sick benefits. Railway employees would all prefer insurance in the brotherhoods to relief funds maintained by the companies. (67, 91, 92.)

There is also established near Chicago a home for aged railway employees which is supported by voluntary contributions from the lodges of the various railway brotherhoods. It now contains 22 inmates. (92.)

The insurance system of the Brotherhood of Locomotive Engineers was established in 1867. It is operated on the assessment plan, and policies are for either \$750, \$1,500, \$3,000 or \$4,500. About \$8,000,000 has been paid to widows and orphans. The local lodges often have assessments and benefits for sickness or injury. The cost of insurance in the general organization has never exceeded 1½ per cent. Men are paid for the loss of a hand, foot, or eye the same amount as for death. The insurance department is incorporated and legally separate from the brotherhood itself. This was found necessary to comply with State laws. (ARTHUR, 117, 121, 126.)

Mr. ARNOLD, grand secretary of the Locomotive Firemen, favors the enactment by Congress of a law giving to all labor organizations the right to carry on insurance business strictly among their members, without requiring incorporation or license from any State except the State where the headquarters may be located. (764.)

5. *Attitude toward nonmembers.*—According to Mr. MOSELEY, the railway brotherhoods show no antagonism toward railway men who do not belong to the organizations. (86.)

The Brotherhood of Locomotive Engineers, says Mr. ARTHUR, does not attempt to dictate to employers whom they shall employ, nor does it put any obstacles in the way of nonunion men. It relies on its record to influence men to join the union. (118.)

6. *Relations to employers* (see also as to *Discrimination in employment*, p. 131; as to *Wage contracts*, p. 138).—Mr. ARTHUR declares that engineers and other railway

employees stand in special need of organization for mutual protection, because each employee is subject to so many superior officers serving in different capacities. The Brotherhood of Locomotive Engineers has established committees to present grievances to employers and discuss matters with them. It does not attempt to dictate whom the railroads shall employ, but seeks only justice for its members. The principle followed has usually been that of the golden rule, and if the railway managers had met the employees in the same spirit there would have been no strikes or difficulties. As a matter of fact, the relations between the railways and the men have usually been very friendly. (117, 118, 123.)

Mr. SARGENT says that for the most part the relation between the various brotherhoods and their employers is a pleasant one. The witness has seldom found officers with whom he could not negotiate and usually reach results acceptable to his organization. Some railway managers, however, consider these organizations injurious to their interest, and use the system of benefit funds and other means to hinder men from joining them. In some cases, too, members, especially leaders in the organization, are discriminated against as to conditions of employment or promotion, or an intimation is made that this is likely to be the case in such a way that violation of law can not be proved. (87, 91.)

Mr. MOSELEY says that a large number of railways are now conforming to rules, regulations, and rates of pay agreed upon between the representatives of the various brotherhoods of employees and the railway managers. There is a feeling of entire accord. The passage of the arbitration act of 1898 has still further promoted this harmony. (36, 37.)

Mr. CALLAWAY, of the New York Central, testifies that a large proportion of the men on that system are members of the various brotherhoods, and that the railway makes no opposition to such membership. The witness personally in his long experience has had little difficulty with the brotherhoods. At first they were inclined to abuse their new power and to make arbitrary demands, but they have become more reasonable and are now largely benevolent associations. They have improved both the morale and the intelligence of the men.

The New York Central has had few difficulties with strikes. The last one was several years ago, and was due to the demand of the employees in the yards to be allowed practically to select their own immediate superiors. In this case the employees were unsuccessful. Mr. Callaway also refers to earlier strikes on the Union Pacific and the Missouri Pacific. (221, 222.)

Mr. INGALLS, president of the Chesapeake and Ohio and the Cleveland, Cincinnati, Chicago and St. Louis, says that he himself and these railways generally are in favor of the organization of their employees, and that contracts are made with the organizations. It is thought, however, that telegraph operators and confidential employees ought not to belong to organizations, and that it is desirable, on account of their smaller number and the variety of their work, to deal with them individually. These railways have never had serious difficulty with strikes. (291.)

While Mr. FISH, of the Illinois Central, is in favor of ordinary railway brotherhoods and organized labor generally, he thinks that the temporary organizations, especially of railway employees, which have sometimes been made through the influence of professional agitators, are essentially "labor trusts." They are irresponsible and injurious. The American Railway Union was a type of these organizations. The Illinois Central does not, Mr. Fish thinks, make contracts directly with the brotherhoods, although their grievance committees are dealt with by officers of the railway. (327, 328.)

On the Baltimore and Ohio, according to Mr. COWEN, agreements as to wages, etc., are made with committees of the men rather than of the brotherhoods. But the officers of the railway also discuss questions regularly with the brotherhoods. The witness thinks that the brotherhoods believe that they have been fairly treated by the railway. (307.)

Mr. SPENCER, of the Southern Railway, believes that a large proportion of the railway employees in the Southern States belong to the brotherhoods. His own company has no objection to the unions, but, on the contrary, frequently discusses questions with them in a friendly manner, although no contracts are made with them. This company has had no strikes or general complaints. Wages have been increased during the past year or two, making up for the reductions which were made during 1892 and 1893. The question of this increase was discussed in perfectly good temper. (266, 268.)

7. *Incorporation of trade unions.*—Mr. CLARK, of the railway conductors, sees no serious objection to incorporation of trade unions, but believes that it will be some time before it will meet with general approval. (116.)

Mr. ARTHUR says that objections to incorporation have been raised by delegates of the Brotherhood of Locomotive Engineers, on the ground that each individual member of the organization could then be sued for acts of the organization. The insurance departments of the railway brotherhoods are incorporated, being legally independent of the brotherhoods themselves. The custody of funds of the brotherhoods is protected by requiring bonds from financial and other officers. (126.)

F. Strikes.—1. *Strikes generally.*—Mr. SARGENT, of the Locomotive Firemen, says that railway strikes are chiefly due to difficulties as to wages or to resistance to unfair conditions of employment. They are resorted to only when all other means of adjustment have failed. They have been highly beneficial in their results to railway employees. The railway brotherhoods are strong advocates of arbitration. (68.)

Mr. ARTHUR says an authorized strike of Locomotive Engineers requires the approval of the Grand Chief Engineer of the brotherhood. It is Mr. Arthur's policy to refuse that approval unless the cause is just. The effect of the organization has been to decrease the number of strikes. (128.)

Mr. O'ROURKE, switchman, of Chicago, hopes that the time has come when there will be no more strikes. He considers that they are to be prevented by closer association and better understanding between employer and employee. In particular he believes that strikes will be prevented, and the interests of organized labor will be furthered, by the exclusion of agitators from labor organizations (528.)

Mr. SARGENT says that the general modern doctrine as to the right of labor to combine or strike is that any body of men may associate themselves for the purpose of bettering their condition in any way, may demand wages at their own rates, and choose their own employers, provided a like liberty is accorded to everyone else. (71.)

Mr. STRONG says that the employees of the railroads are under no obligation to stay at their work a moment. The railroads exercise the right to discharge men without any notice whatever. If the men leave without notice they are only exercising the same right. The railroads can not properly construe such leaving of employment as an offense, comparable with drunkenness, or carelessness in the performance of duty. (522.)

Mr. WALKER, chairman of the directors of the Atchison, Topeka and Santa Fe Railway, declares that there can be no question of the right of workmen to strike, but that the moment they have struck they cease entirely to be employees and have absolutely no claim upon the property of their former employers. They may negotiate for reinstatement, but they can not justly interfere with the operation of the business by other persons. In fact, public opinion has now generally come to recognize that strikers are not justified in employing violent measures of any sort. The witness, however, thinks that employees are justified in forming a combination for their mutual benefit. (774.)

2. *Boycotts.*—According to Mr. ARTHUR, it was formerly the rule of the Brotherhood of Locomotive Engineers that where a duly authorized strike was made on any road the members of the organization on other roads should refuse to haul its cars. Such refusal was enjoined in the case of the Toledo, Ann Arbor and North Michigan Railroad strike, and the order was upheld by the United States Supreme Court. This rule of the organization has accordingly been abandoned. (120, 126.)

3. *Railroad strike of 1894.*—Mr. STRONG, an attorney at law of Chicago, says that the strike of the railroad men in 1894 was brought about altogether by generous sympathy with the Pullman men, and was meant to induce the railroads to persuade the Pullman Company to arbitrate its differences with its employees. The strikers had no idea of tying up the traffic of Chicago, at least for more than a few days. The destruction of property which actually took place has been greatly exaggerated, according to Mr. Strong. He says that the Labor Commission reported, after careful investigation, that the railroads lost in property, including the hire of 3,000 deputy marshals and other incidental expenses, a total of \$685,783. (506.)

Mr. Strong says that within 10 or 12 days after the commencement of the Pullman strike there were 1,600 families in Pullman, who had been employees of the Pullman Company from 5 to 20 years, and who were absolutely destitute of the necessities of life, depending on public charity for support; showing, as he thinks, that they had not been able to accumulate enough out of the pittance they had received to support them for 2 weeks. (505.)

Mr. O'ROURKE, switchman, states that fully 90 per cent of the switchmen of Chicago went out in the strike of 1894. Two-thirds of them, he believes, are now

at work in Chicago as switchmen. A great number of the officers and members of the A. R. U. Mr. O'Rourke considers to have been professional agitators, especially in Chicago. (529.)

G. Injunctions in strikes.—1. *Intimidation of employees, etc.*—Mr. MOSELEY, secretary of the Interstate Commerce Commission, submitted a large number of abstracts of decisions of courts in which injunctions had been issued forbidding the intimidation of persons seeking employment or of those already employed to prevent them from working. In the various cases the methods of supposed intimidation are defined and enjoined specifically; such as displaying banners before the premises of the employer, publishing placards and other statements addressed to employees, uttering menaces and threats, including even mere requests not to enter upon or continue work. Thus in one case a notice to a foreman of the shops of a railroad requesting him to stay away from work until the strike was settled, but adding, "In no case are you to consider this an intimidation," was still held to be a threat. Under the interstate-commerce act and the antitrust act various injunctions to prevent interference with the conduct of railways by intimidation or threats have also been issued. In one case, however, an injunction to prevent persecution of plaintiff's company by strikes, boycotts, violence, or intimidation was refused, since no threat to do any unlawful act was shown. (9-11.)

According to Mr. SARGENT, of the Brotherhood of Locomotive Firemen, on trial of the habeas corpus proceedings to secure the release of Debs et al., the court held that the United States had a right to remove any obstructions on highways over which mails must be carried, to supervise interstate commerce so as to prevent great public inconvenience, and to enjoin all persons from interfering with those engaged in the operation of roads in the hands of receivers, or engaged in interstate commerce, or carrying United States mails. A violation of such an injunction may be punished as contempt. 158 U. S. 564. (73.)

2. *Compulsory performance of service.*—Mr. MOSELEY shows also that in various cases injunctions have been issued by the courts to compel railway employees to perform particular services. This is especially common in the case of railways under receivership. In 1893 Judge Jenkins, of the United States circuit court, enjoined the employees of the Northern Pacific Railroad, about 12,000, from quitting the service of the receivers with the object of crippling the property or embarrassing its operation. The United States circuit court of appeals, however, reversed the order as an invasion of natural liberty. In another case one Lennon was punished for contempt of court in refusing to handle cars from the Ann Arbor Railway, he being an engineer of the Lake Shore and Michigan Southern. In this case it appears that the injunction was issued without any hearing of the railway employees and in the office of the railroad itself. (See fuller account of these cases below.) The witness advocates a bill prohibiting courts of the United States from enforcing specific performance of contracts for personal service by injunctions. (8, 12, 13.)

3. *The Northern Pacific case, 1894.*—Mr. SARGENT, of the Locomotive Firemen, says that in 1894 Judge Jenkins issued an order enjoining the employees of the Northern Pacific Railway, then in the hands of a receiver, "from combining and conspiring to quit, with or without notice, the service of said receivers with the object and intent of crippling the property in their custody or embarrassing the operation of said railroad, and from so quitting the service of said receivers, with or without notice, as to cripple the property or to prevent or hinder the operation of said railroad." (60 Fed. Rep., 803.) This matter was afterwards brought before the circuit court of appeals, and it was held that it would be an invasion of one's natural liberty to compel him to work for or remain in the personal service of another. The fact that employees of railroads might quit under circumstances that would show bad faith or disregard of contract does not, the court holds, justify a departure from the general rule that equity alone will not compel the affirmative performance of simply personal services. Since these employees had entered service under a general contract which did not limit their right to quit the service, it would not be illegal or criminal for them, by peaceable cooperation, persuasion, and conference, to assert their right to refuse further service, even though they expected that their quitting simultaneously without notice would temporarily inconvenience the receivers and the public. Any loss due to such quitting would be merely incidental to the situation and not legally chargeable upon the employees. On the other hand, there might be circumstances where the employees could be held guilty of a conspiracy in combining to wrong others or the public, and such a conspiracy is illegal, even though no act be performed toward carrying it out. Any combination which had for its object to cripple the property in the hands of the receivers and embarrass the operation of the railroad either by disabling the engines, cars, or other property, interfering

with their possession or use, or employing force, threats, or other wrongful methods against the receivers and their employees, would be illegal conspiracy. (See 63 Fed. Rep., 310.) (65, 66, 73, 74.)

Mr. Sargent declares that there had been no intention on the part of the employees of the Northern Pacific Railroad to strike previous to the issuance of the injunction by Judge Jenkins. The receivers had issued a new and lower schedule of wages, in violation of an existing contract with the organization of the employees. While the representatives of the men were consulting with the company the injunction restraining them from quitting service was issued. Its ultimate result was to bring about a general strike, and, had it not been for the restraining influence of the organization leaders, there might have been a rebellion among the men. The injunction also restrained the leaders of the various brotherhoods from even advising or counseling with the employees of the road. Thus the witness was served with such an injunction at his office in Indiana. (89.)

Mr. ARTHUR, chief of the Locomotive Engineers, confirms the testimony of Mr. Sargent regarding the causes of the difficulty and the nature of the injunction in this case. He and others in the office of the Brotherhood of Locomotive Engineers at Cleveland were enjoined from talking, counseling, conferring or advising with the members of the brotherhood employed on the Northern Pacific. It was, of course, impossible for a body of men to quit employment without to some extent crippling the business, as the injunction undertook to restrain the employees from doing. (119.)

In 1894 the receivers of the Union Pacific Railway followed the example of those of the Northern Pacific Railway in petitioning for an injunction to prevent employees from striking when a reduced schedule of wages should be put in force. This injunction was granted by the lower court, but reversed by the higher Federal court. (63 Fed. Rep., 7.) (SARGENT, 74.)

4. *Toledo, Ann Arbor and North Michigan case.*—Mr. SARGENT says that in 1893, in the case of the Toledo, Ann Arbor and North Michigan Railroad Company v. The Pennsylvania Company et al., it was held that a combination to induce the officers and engineers of a common carrier to refuse to receive and handle interstate freight from another carrier is a criminal offense, and that the carrier injured has a cause of action against all those engaged in it. An injunction may be issued to restrain the chief member of such a conspiracy from giving such an order, or to compel him to rescind it. An injunction may also be issued to compel such a carrier and its employees to haul the cars of the other company, and this is binding on all officers and employees whether they be made parties or not. Employees can evade this obligation only by quitting the service of the company. (54 Fed. Rep., 730, 746.) (72; see also 65, 66.)

Mr. ARTHUR says that the strike on the Ann Arbor road was caused by its president breaking a contract with the railway brotherhoods in reducing wages. Although evidence as to this contract was produced in court, the judge granted an injunction restraining the employees of other railroads from refusing to haul cars of the Ann Arbor road in through traffic. This order was sustained by the United States Supreme Court under the antitrust law. Owing to this decision the Brotherhood of Locomotive Engineers has abandoned its former rule for boycotting traffic from roads on which authorized strikes are in force. In addition to this injunction the officers of the brotherhoods were enjoined from advising or consulting with their men. (119, 120.)

5. *Receivers protected by injunction.*—Mr. MOSELEY says that the courts have issued numerous injunctions to restrain employees from interfering with the operation of railways by receivers. Apparently injunctions are issued under these circumstances against acts which would not be restrained if the railway were not under receivership. It has also been held that, in the absence of injunction, an attempt to interfere with the management, or cripple the property, or intimidate employees or those seeking employment, is a contempt of the court appointing the receiver. In another case a person attempting to induce men to quit work for a receiver was arrested. The action of the lower court in the Northern Pacific case, however, where it was sought to enjoin all the employees from quitting work, was overruled by the United States circuit court of appeals. (11, 12.)

Mr. SARGENT, as illustrating this practice, says that in 1885 the Wabash Railroad was in the hands of a receiver. The chairman of a committee of striking employees sent notice to the foremen of the various shops of the road requesting them to stay away from the shop until the strike should be settled, but adding, "In no case are you to consider this an intimidation." The courts held that this was an unlawful interference with the receiver's management and a contempt of court. (24 Fed. Rep., 217.) In another case in 1885 it was held that the

employees of a receiver are guilty of contempt of court if they resort to threats or violence, or seek to overawe others by preconcerted demonstrations of force, in order to induce them to leave employment and thus hinder the operation of the road. Where a party of men combine to do an unlawful thing, and one of them does an act which the others do not, all are responsible for his act. (*U. S. v. Kane et al.*, 23 Fed. Rep., 748.) (71, 72.)

6. *Restriction of use of injunctions.*—Mr. MOSELEY declares that the frequent use of injunctions is exasperating to the wage-worker and is tending to bring the Federal judiciary into disrepute. The employees are not given a fair hearing, but employers seem to secure injunctions for the asking, as in the Lennon case. The witness admits the duties of railway employees toward the public as a third party; but he believes that railway employees recognize those duties and usually fulfill them, and that they should have accordingly a special protection. (12, 13.)

Professor JOHNSON says that railways have found the injunction an important means of securing their ends in disputes with their employees. They have at times taken occasion to attach mail cars to as many trains as possible for the sake of the protection of the courts. The witness believes that some statutory limitation will have to be placed on the use of the injunction. (63.)

The chief officers of the leading railway orders, in a joint reply to a schedule of inquiries, declare themselves in favor of a bill, which has already been introduced at a previous session of Congress, dividing contempts of court into two classes, those committed in the presence of the court and those not committed in its presence. The latter, which are called indirect contempts, should be treated by different procedure from direct contempts. A written accusation should be made and the accused required to answer. The trial should proceed upon testimony as in criminal cases; the accused should be entitled to be confronted with the witnesses, and the court should have the option of summoning a jury. Especially should the judgment be subject to appeal to higher courts. The text of the proposed law is submitted in full. The witnesses declare that the criminal laws are brought into contempt by the too liberal use of injunctions. In fact, where men simply exercise their inalienable right to cease work, and where they pay due regard to the public safety, there is no occasion for an injunction of the Federal courts at all. (761, 762.)

These officers maintain also that the enjoining of men from taking concerted action in leaving the employ of railways or from using proper and peaceable means to induce others to do so is unjust and should be prohibited. The criminal code provides proper penalties for criminal actions. (65, 66.)

Mr. ARNOLD, of the Brotherhood of Locomotive Firemen, also favors the bill providing for two classes of contempt, and thinks that the court should not be given the right to imprison for contempt committed without the direct knowledge of the courts. (764.)

Mr. WILSON, of the Brotherhood of Railway Trackmen, thinks that either party in an injunction case should have the right to have disputed questions of fact tried by jury; but otherwise that the procedure of injunction should not be done away. (766.)

Mr. RONEBUS, of the Railway Carmen, declares that no injunction should be used against employees until they have had an opportunity to answer. Injunctions against men who have committed no actual offense and do not contemplate doing so are un-American. (769.)

Mr. MURPHY, an attorney at law of Denver, declares that where injunctions are issued in connection with strikes they usually forbid acts which are already illegal and criminal under statutes, and that they are accordingly unnecessary. Moreover, the issue of such injunctions deprives citizens of the right of trial by jury, which has always been considered absolutely essential to securing justice. The judge who acts in an injunction case must decide that certain acts have been committed, a question which properly belongs to the jury. The strict laws of evidence which would be applied in criminal cases do not necessarily govern the judge in a case for contempt. The judge is biased on the ground that his authority has been disregarded. The witness would apparently favor the prohibition of injunctions in connection with strikes. (779, 780.)

Mr. WALKER, chairman of the directors of the Atchison, Topeka and Santa Fe Railway, sees no reason for interfering with the well-established rules of equity concerning injunctions. There may be errors in the decisions of the lower courts concerning such matters, but the body of the law is composed of the decisions of the courts of last resort. (772.)

H. Arbitration.—1. *Generally.*—The officers of the leading railway brotherhoods, in a joint statement, declare that the brotherhoods are strong advocates of conciliation and arbitration. Their experience with these methods has been satisfactory.

Compulsory arbitration would involve permanent boards and would take away the very spirit of arbitration. Two cases of arbitration under the Canadian law on the Grand Trunk Railway have recently been settled by award in favor of the employees. (68, 69, 94, 95.)

Mr. ARTHUR, grand chief engineer, says the policy of the Brotherhood of Locomotive Engineers has been to conciliate employers, sending committees to discuss difficulties with them, and referring unsettled matters to the chief officers of the organization. (125.)

Mr. INGALLS, president of the Chesapeake and Ohio, thinks that moral suasion and mediation between parties in labor disputes is advantageous. There must be consideration on both sides. The railways which he represents would not, however, be willing to arbitrate the question of an increase in wages, without some limitation, such as that the wages should not exceed those of rival lines; they could not afford to leave the final decision to anyone but their own directors. (291.)

Mr. CALLAWAY, president of the New York Central, does not think that arbitration of labor disputes on railways is likely to be of great importance. Compulsory arbitration is out of the question. There is no way of compelling men to continue work if they do not wish to. On the other hand, the railways will not voluntarily submit disputes involving really vital matters to the decision of outside authorities. They must have employees who will carry out orders and obey instructions. The influence of a change of even 10 per cent in the rate of wages upon the earnings of a railway company is so great that Mr. Callaway, at any rate, would hardly be willing to submit a question involving such an increase to arbitration. (291, 222.)

Mr. FISH, of the Illinois Central, thinks that the chief objection to the arbitration of railway matters is the impossibility of maintaining effective discipline over the men if authority is divided. The railways are held responsible to the people, and must have discipline. (324.)

2. *United States arbitration act of 1898.*—Mr. KNAPP, chairman of the Interstate Commerce Commission, testifies that the United States arbitration act of June, 1898, has as yet had no direct effect upon the settlement of labor disputes concerning railways. The act provides that either party to a controversy may apply to the Commissioner of Labor and the chairman of the Interstate Commerce Commission to act as mediators. If the mediation fail, the parties, if they agree to arbitrate, each appoint one arbitrator, and a third is appointed by the Commissioner of Labor and the chairman of the Interstate Commerce Commission. In only one instance so far has there been any application for mediation. This came from the side of the employees, and there appeared to be clearly a situation within the contemplation of the law. The officers of the common carriers, however, declined all offers of conciliation and refused to arbitrate, declaring that the controversies related only to wages, and that the influence of the rate of wages upon profits was so great that they could not afford to submit the determination to any other authority.

Mr. Knapp is of the opinion that resort to arbitration must necessarily be voluntary, and, accordingly, that if other railroads take the same position as was taken in this case, law can accomplish nothing. He thinks, further, that if the attempts at conciliation by the Commissioner of Labor and chairman of the Interstate Commerce Commission in any case shall prove unsuccessful, the parties will not be willing to arbitrate, since the decision of the third arbitrator would be likely to be practically the same as that of the officers just named who appointed him.

The witness, however, is able to suggest no amendment to the measure. (129-131.)

Mr. MOSELEY, secretary of the Interstate Commerce Commission, says that the arbitration act enables employees and employers to come together without any surrender of ground. The Government itself steps in and urges arbitration; and the side which refuses to arbitrate is likely to receive public condemnation; The relations between railways and their employees have never been so harmonious as since the passage of this law, and it meets the approval of all railway men. (37.)

The chief officers of the leading railway brotherhoods think that the act of June 1, 1898, has not yet been given a fair test; indeed, there has been no occasion to take advantage of it. If proper earnestness be shown by Government officials, it may have good results. They have no changes to suggest. (68, 69, 762.)

Mr. WILSON, of the Brotherhood of Railway Trackmen, however, points out that the act does not apply to employees except those engaged in the operation of trains. Out of 823,476 employees, 596,859 have no protection under the law. The

measure should be extended to them. Moreover, the witness thinks that the Interstate Commerce Commission should be made a tribunal before which all classes of railroad employees could present their grievances. It should be the duty of the commission to take testimony and make a public record of their opinion as to the justice of the case. Public opinion would then have great influence in compelling railways to accept the decision. (766, 767.)

Mr. RONEMUS, of the Railway Carmen, favors a somewhat similar system to that proposed by Mr. Wilson. (770.)

Mr. ARTHUR thinks it is just to compel the parties to arbitration, especially in the case of railways, to abide by the awards of the arbitrators. The existing United States arbitration act, however, is of great advantage without the compulsory clause, since public opinion will be a powerful influence in compelling both sides to accept arbitration when either asks for it, and to abide by the decision. However, there has been no experience on the part of the Locomotive Engineers under this law. (125.)

Mr. COWEN, of the Baltimore and Ohio, does not think that the arbitration act will have any effect. Railway companies will not permit outside authorities to fix wages, especially since no power can bind the employee unless practical slavery be introduced. (309.)

3. *Compulsory arbitration.*—The chief officers of the five leading brotherhoods of railway employees are opposed to compulsory arbitration, as involving involuntary servitude. (762.)

Mr. ARNOLD, secretary of the Brotherhood of Locomotive Firemen, is of the same opinion. (764.)

Mr. MURPHY, an attorney at law of Denver, thinks that compulsory arbitration is both practicable and advantageous. Corporations, being creatures of the law, can be made to submit to any condition imposed upon them. The great interest which the public has in the conduct of railways, and in preserving the general stability of business, would justify any interference with labor disputes in this way. (780.)

Mr. WALKER, chairman of the directors of the Atchison, Topeka and Santa Fe Railway, in reply to a schedule of inquiries concerning railway labor, submitted a detailed argument against compulsory arbitration. The witness recognizes the right of laborers to strike and to form unions, but he declares that during strikes they have no rights whatever as regards the property of their employers. As a matter of fact, the strike is ultimately the only effective way of settling labor disputes. Force, not in the sense of physical force, but of economic ability to resist, must be ultimately decisive.

Arbitration which is compulsory is a contradiction of terms. Arbitration can only mean a contract to submit questions to a decision, and it is enforceable as a contract and not otherwise. Compulsory arbitration would involve the right of one party to compel another to appear before a tribunal, and this would be essentially a judicial proceeding. Moreover, there are some things which, from their very nature, can not be arbitrated. Thus, if the workmen assert a claim that no one shall be employed who does not belong to a given labor union, the employer having the inherent and essential right to employ whom he will, there is no question for arbitration. A merchant would be justified in refusing to arbitrate the price of his goods.

It is very difficult to find men to whom questions concerning labor disputes may be prudently submitted. The universal tendency of arbitrators is to split the difference, and this inevitably gives advantage to the workmen, especially since the pecuniary risk of the employer is much greater than that of the laborer. Moreover, arbitrators are bound by no rules of law, and they are apt to be prejudiced in favor of the supposedly weaker party.

Finally, the laborers can not be effectively bound by the decision of arbitrators. The decision may be binding upon the labor union, but the union can not control the actions of its members, who are always at liberty to withdraw. The employer, on the other hand, is bound.

As a matter of fact, Mr. Walker thinks, workmen are not anxious to submit questions to arbitration until they have found that they are unable to obtain their demands in any other way. They seldom think of arbitrating until a strike has proceeded so far as to become apparently a failure. This feeling is fostered by the leaders of many labor unions, who find their chief advantage during the period of the strike. (773-776.)

I. Accidents and injuries.—1. *Safety appliances—United States act of 1893.*—Mr. MOSELEY, secretary of the Interstate Commerce Commission, says that by this act railways were required within 5 years to equip freight trains with air brakes and train brakes sufficient to enable the engineer to control the train directly,

and to equip all cars with automatic couplers and with hand holds. At the end of this time some roads had almost entirely failed to comply with the act, and as those which had done so were by the law practically punished by being prohibited from hauling the cars of other roads not so equipped, the Interstate Commerce Commission extended the time for 2 years, to January 1, 1900. The witness does not think further extension will be asked for or necessary. (32.)

Mr. CLARK, chief of the railway conductors, says that the extension of time for 5 years asked by the railroads was opposed by the various railway brotherhoods, and they succeeded in having the time reduced to 2 years. The same testimony is given by Mr. ARTHUR, who adds that some of the roads had been prevented from complying with the law by the depression in railway business, but that others had simply neglected to do so, although their earnings were ample. (115, 126.)

The officers of all the leading railway brotherhoods declare that they think the railways are doing all they can to comply with the law concerning safety appliances, and that no further legislation is necessary. (763, 767.)

Mr. KNAPP, chairman of the Interstate Commerce Commission, testified in October, 1899, that very rapid advance was being made by railroads in equipping their cars with the safety appliances required by law, and he did not think that there would be an application for extension of the time for equipment beyond January 1, 1900. (131.)

Several railway officers testified on this subject before the expiration of the time limit for the equipment of cars, January 1, 1900.

Mr. CALLAWAY said that the New York Central had entirely and promptly complied with the requirements of the act of Congress as to safety appliances. All its cars have automatic couplers and handholds and about 68 per cent of the freight cars have air brakes. There was some difficulty at first in securing sufficiently strong couplers, but this has now been remedied. During the period of transition there has been no marked decrease in the number of accidents, but when all cars are properly equipped the witness believes that there will be decidedly fewer casualties.

The New York Central is equipped throughout with the block-signal system, which gives information to coming trains of any difficulty. Stoves have been replaced altogether by steam heat, but the witness is doubtful whether this decreases risk materially. The cars of this road are largely lighted by Pintsch gas, and some experiments are being made with electric lighting, which has hitherto scarcely proved satisfactory. The system is almost altogether double tracked. (219, 220.)

Mr. INGALLS said that the Chesapeake and Ohio and the Cleveland, Cincinnati, Chicago and St. Louis railroads expected to have their equipment of safety appliances complete by January 1, 1900. (291.)

Mr. SPENCER, of the Southern Railway, said that that system expected to comply with the requirements concerning safety appliances by January 1, 1900, a large proportion of the cars being already equipped. The master car builders' vertical car coupler is used. (268.)

Mr. COWEN, of the Baltimore and Ohio, stated in October, 1899, that a large proportion of the cars of that company had been equipped with air brakes and automatic couplers. A certain proportion of the cars are not worth the expense of putting on these appliances. They will be used in local traffic and will gradually go out of service altogether. The reason why the process of equipping cars has been necessarily slow is that no large proportion of cars could be taken out of service without interfering with the business of the country. The new equipments have been put on chiefly at times when the cars were taken into the shops for repairs and reconstruction. (308.)

Mr. MOSELEY states that there was a great dispute among railway men as to the relative merits of the vertical-plane coupler, which had been approved by the master car builders, and the link-and-pin coupler, similar in form to the old hand couplers. The former was finally generally approved. Its special advantage is that it holds the cars closely together, preventing slack. This coupler was free from patents. The act likewise required that the drawbars of cars should be of a standard type. This was fixed by the American Railway Association at not less than 31½ nor more than 34½ inches, and railways have generally complied. (83.)

Mr. SARGENT, of the Locomotive Firemen, says that the cost of air brakes is \$29.75 per set. If they are applied to cars having substantial foundation brake gear, the cost of putting on the brakes should not exceed \$5; if new foundations and brake gear are necessary, about \$20.

The cost of putting automatic couplers on new cars should not exceed from \$13 to \$20. On old cars there may be added expense for strengthening the draft tim-

bers, etc., but this expense would be necessary in any case, since old cars of light capacity are unfit for use along with modern heavy cars and engines. At any rate most cars now used are new, since there has been a marked tendency to increase the size of cars in recent years. (67, 68.)

2. *Effect of safety appliances.*—Mr. MOSELEY says that the result of the requirement concerning couplers and air brakes has been greatly to reduce accidents. Considering the amount of freight handled, only about half as many men were killed and half as many injured in 1897 as in 1893. The number killed was 1,067 less. The change has also resulted in saving loss of links and the breakages in the old style of coupler, involving considerable expense. The requirement as to air brakes was necessary especially to prevent the rear-end collisions which were formerly frequent. It is proving an economy to railways. Trains can make much faster time, because they need not take so long to slow down, and the capacity of cars can be increased. Where an employee formerly handled 200 tons of train load he can now handle 600 or 800. (32-34.)

Mr. KNAPP says that the effect of the change already seems to be a decided decrease in the casualties to the employees. At the same time, on account of differences in the equipment on different cars, imperfect appliances, and lack of experience, there might be expected to be numerous accidents during the period of transition, so that the full effect can not be judged. (31.)

Mr. SPENCER expects that casualties will be considerably diminished by these appliances, although the results of individual carelessness can not be eliminated. He does not think that the amount of labor required on trains will be reduced by them. The use of air brakes on passenger trains has not lessened the number of employees. The work of operating trains is actually becoming more complicated. Nevertheless, these devices help in securing efficiency and apparently reduce the relative demand for labor, although not causing absolute reduction in numbers. (268, 269.)

Mr. INGALLS thinks the law of 1893 was a wise one. The real test of its efficiency in preventing casualties will be made after January 1. The railways which are fully equipped will then refuse to exchange cars with those which are not. (291.)

Mr. COWEN says that although the use of these appliances probably adds considerably to the safety of the employees there are some new dangers connected with them, such as from the necessity of getting under the cars to fix the pipes on the air brakes. (309.)

Mr. STICKNEY, president of the Chicago Great Western Railway, thinks that the use of safety appliances will probably reduce the number of accidents and result in a considerable saving to the railroads. He does not believe that there has been much reduction in the number of accidents up to the present time, but that was perhaps not to be expected. (455.)

3. *Proposed State law as to safety appliances.*—Mr. MOSELEY favors the enactment of uniform laws by the separate States requiring railways lying wholly within a State to equip their engines with power driving-wheel brakes and their cars with train brakes, automatic couplers and drawbars of standard height, and hand holds, as well as to block all frogs, switches, guard rails, etc., to prevent the catching of feet. This bill, which is submitted in full, is similar to the existing United States act requiring safety appliances on interstate railways. (39.)

Mr. SARGENT advocates the law proposed by the Interstate Commerce Commission, for enactment by separate States, requiring the use of automatic couplers and continuous brakes. There are many roads lying wholly within single States which yet haul cars in interstate traffic, and employees on these should be protected. (93.)

4. *Blocking of frogs.*—Mr. MOSELEY declares that men have been killed in the District of Columbia recently for lack of proper blocking of switch frogs. He accordingly recommends a bill for requiring them to be properly blocked in the Territories of the United States and in the District of Columbia. (38.)

Mr. CLARK says that the proposed law requiring the blocking of frogs in the District of Columbia, the Territories, etc., is of less importance than it would have been before the introduction of automatic couplers. These obviate the necessity for going between cars, and it was principally while doing so under the old system that accidents from catching the feet in frogs occurred. (115.)

5. *Report of accidents.*—Mr. MOSELEY favors a requirement that in case of accident resulting in killing or injuring employees or others railways should notify the Interstate Commerce Commission at once, giving it an opportunity to investigate as to the cause. Railways should also report accidents, with their causes and results, each month instead of annually, as at present. None of these reports should be made the basis for damage suits. The witness submitted the form of a bill for this purpose. (37, 38.)

This measure is also commended by the officers of the 5 great railway brotherhoods in their joint reply to the schedule of inquiries as to railway labor. (783.)

Mr. SARGENT also advocates this proposal. (93.)

Mr. CLARK, of the Railway Conductors, declares that the condition of the railways and the welfare of railway employees are matters of general public interest. The presentation of statistics concerning accidents is of great importance. Such statistics had much influence in securing the passage of the act requiring the use of automatic couplers and brakes, and more detailed information than is now received would be of material value. (114.)

Mr. STICKNEY, president of the Chicago Great Western Railway, does not believe that a requirement that the railroads should report the details of accidents to the Interstate Commerce Commission would secure very much definite information. Railway companies themselves try to discover the causes of accidents, but in some cases reach only indefinite results. Still such a requirement would not work any particular hardship to the railroads. (156.)

6. *Contribution by railways to injured persons.*—Professor JOHNSON says that, aside from benefit funds maintained by certain railway companies, it is quite a common practice for these and other roads to contribute to injured employees or to the families of those who are killed. Moreover, those who are injured so as to be unable to perform hard labor are often given some subordinate position, such as that of watchman. (59.)

According to Mr. CALLAWAY, it is the practice of the New York Central to allow persons injured half pay during the time of disability, or, in case of permanent incapacity, to provide them, if possible, with some light employment at a gate or signal tower, or in some such place. Similar arrangements are made for the benefit of older men. The company has no regular pension system, but frequently does grant pensions to individuals at various rates. The railroad has no hospitals of its own, but these are scarcely necessary, as it has arrangements with private hospitals at various points. The men largely belong to associations for mutual relief, and many also insure with accident insurance companies. (218, 219.)

7. *Hospital associations.*—Mr. SARGENT says that these are maintained by various railways, and where honestly conducted are of great benefit. Thus the Southern Pacific Railroad collects 50 cents per month from firemen and a proportionate sum from all other employees, including the president and managers, and the hospital facilities furnished are very acceptable to the employees. The funds thus accumulated may become very large. Recently the Union Pacific hospital department was investigated in the courts, and it was found that the funds had been mismanaged and diverted from their purpose. (92.)

The Chesapeake and Ohio Railroad has recently established a hospital which cost the railway \$75,000, and which, Mr. INGALLS declares, is very complete. It is supported by assessment upon all employees who care to have the privilege of its use. Even the officers are nominally assessed, although Mr. Ingalls has commuted his own payment. The railway is also hoping to establish a pension system for disabled or superannuated employees. (289, 290.)

J. *Liability of railways for injuries to employees.*—1. *Assumption of risk by employees.*—Mr. SARGENT, of the Locomotive Firemen, submitted a paper summarizing the common-law doctrines as to employers' liability.

Where an employment is accompanied with risk, of which those who enter it have or are presumed to have notice, they can not, if they are injured by exposure to such risks, recover from the employer. By contract to perform hazardous duties the employee assumes such risks as are incident to their discharge, including such as arise during the course of employment, if he had or was bound to have knowledge thereof. He does not, however, assume the risk of danger arising from unsafe or defective methods, machinery, or other instrumentalities, unless he has or may be presumed to have knowledge or notice thereof; and the burden of proof that an injured employee had such knowledge or notice of the defect or obstruction causing the injury is upon the employer. (75.)

2. *Who can sue for injury.*—All of the States and Territories within the United States have a statute giving the right to the person injured to bring suit for damages, and in case the injury is fatal, then the statute provides either that the widow or heirs of the decedent, or the representatives of the decedent (his executors or administrators), shall have the right to sue, and to derive benefit from any recovery that may be had. (SARGENT, 75.)

3. *Defective appliances and rules.*—An employer is liable in damages to his employee where the employee, free from negligence, sustains an injury through the employer's negligence. Such negligence may consist in the doing of something by the employer which, in the exercise of ordinary care and prudence, he ought not to have done, or in the omission of any duty or precaution which a prudent, careful man would or ought to have taken.

It is the duty of the master to furnish his servant with such appliances, tools, and machinery as are suited to his employment and may be used with safety; and he is responsible for all defects which he should or could have known, but failed through negligence to learn of, or which, having learned of, he failed to remedy.

A railroad company is liable for injuries occasioned by its negligence in failing to keep its track or roadbed or other surroundings under its control in proper condition; however, its duty is only to use reasonable care.

Employers are not required to furnish the best and latest improved machinery, but only such as is reasonably safe and suitable.

A master who sets a servant to work in a place of danger without giving him such warnings and instructions as the youthfulness, inexperience, or lack of capacity of the servant reasonably requires, is guilty of negligence and liable to the servant for any injury arising therefrom.

It is the duty of employers to make such regulations for their employees as will give them reasonable protection; and employees are bound to obey all lawful and reasonable commands of their employers, and an injury resulting to the employee while disobeying rules would not entitle him to recover damages. (SARGENT, 74.)

Mr. MOSELEY, secretary of the Interstate Commerce Commission, says that the common law, as affirmed by numerous decisions in this country, holds a master liable for injury to his servants resulting from defects in machinery or appliances of which he might have known by the exercise of ordinary care. But it is ordinarily held not necessary that he furnish the very best appliances known, and the continued use of an appliance which has long been used safely does not imply negligence. The tendency is in the State courts toward greater liberality toward the employee. In the *Greenlee* case in North Carolina, May, 1898, it was held that the railroad was liable because it did not use safety appliances which experience had shown to be best. In another case in the same State this doctrine was reaffirmed as being as old as the law itself: "When safer appliances have been invented and have come into general use, it is negligence per se for the master to expose his servant to the hazard of life or limb from antiquated appliances which have been generally discarded by the intelligence and humanity of other employers." Economy of expenditures on the part of the railroad is not to be deemed superior to the conservation of life and limb. (25-28.)

4. *Liability for acts of fellow-servants.*—Mr. SARGENT states the common-law doctrine as to the liability of employer for injuries to employees through the acts of fellow-servants as follows: Where a master uses due diligence in selecting competent, trusty servants, and furnishes them with suitable means to perform the services in which they are employed, the master is not answerable to one of them for an injury received through carelessness and negligence of another while both are engaged in the service.

All who serve the same master, work under the same control, derive authority and receive compensation from the same common source, and are engaged in the same general business, though it may be in different grades or departments of it, are fellow-servants who take the risk of each other's negligence. (75.)

Mr. MOSELEY, secretary of the Interstate Commerce Commission, says that most cases where persons are injured through the acts of coemployees or fellow-servants in the United States are decided under the common-law doctrine, not being regulated by special statute. That doctrine relieves the employer from liability in case he has used reasonable care in selecting his servants. The only question, therefore, is the correct definition of fellow-servants. As to this point, the numerous cases cited by the witness show marked divergences, but the greater number appear to consider all employees of the same master or company, whether they have power of direction or not, as fellow-servants. Thus it is held that the servant causing and the servant sustaining the injury need not be engaged in the same kind of work, and one may be the superior of the other. Thus on buildings and in cases of laborers working by gangs generally, one having direction as a boss is still regarded as a fellow-servant. But in Illinois, where their employment does not require cooperation and result in mutual contact such that each might influence the other toward safety or caution, servants of the same employer are not fellow-servants; habitual association is necessary. In regard to railways specifically, many decisions hold that trainmen are all fellow-servants of one another and also of trackmen, employees in shops, telegraph operators, switchmen, etc. There are, however, numerous conflicting decisions; for example, conductors and engineers are held the superiors of brakemen, as vice-principals. In *Gulf, C. & S. F. Ry. Co. v. Warner*, the court defines fellow-servants to be those engaged in a common service, in the same grade of employment, working together at the same time and place, and working to a common purpose.

The doctrine of fellow-servants has been abrogated as regards railway employees by the statutes of several States, notably Texas, where the act has been held constitutional.

Uniformity in the law is very desirable and should be secured by a Federal statute. Mr. Thomas G. Shearman especially urges that under modern conditions the liability of common carriers should be extended rather than, as court decisions often tend to do, restricted. (21-25, 28).

Mr. WILSON, of the Railway Trackmen, declares that the fellow-servant doctrine in many States is so interpreted as to work great injustice to railway employees, especially trackmen. The laws and court decisions vary greatly in different States. (53, 54.)

Mr. COWEN, president of the Baltimore and Ohio, says that the attitude of the courts and of the statutes regarding the liability of railroads for the acts of fellow-servants differs considerably in different States. There would be some advantage in a uniform rule. In Ohio, without statute, the courts have been inclined to consider many railway employees as being superior officers for whose acts the company is liable. (304.)

According to Mr. INGALLS, president of the Chesapeake and Ohio, the attitude of courts and juries toward the railways in suits for damages for personal injury, both to employees and others, is different in almost every State. In Kentucky his railway has never, except during the past year or two, had fair treatment. In most States the attitude toward railways is much better now than 10 or 20 years ago. As a railway manager Mr. Ingalls would like to have the liability for injury limited, but he thinks it would be a mistake from the standpoint of the public. (289.)

5. *Proposed extension of liability.*—Mr. SARGENT says that laws modifying the doctrine as to fellow-servants, so as to extend the liability of railway companies, have been passed in Texas, Missouri, Wisconsin, Florida, Georgia, Iowa, Kansas, Massachusetts, Minnesota, Montana, Ohio, and other States. The effect of the law has been or will be, the witness hopes, to induce employers to be more careful in selecting men, and to make the men more careful of their fellow-employees. Railway employees would prefer to prevent accident rather than to secure indemnity.

Since men have no choice as to who shall be their fellow-employees, and often know nothing about their character, the company should be responsible for their acts. The courts and laws regularly free railways from liability where injury is due simply to natural risks or to contributory negligence by the person injured. Where the railways fail to furnish proper appliances liability should attach to them for accidents. (66, 89.)

Mr. CLARK, of the railway conductors, thinks full liability should attach to railway companies for injuries in any way due to improper equipment of roadbed or to acts of fellow-employees. Railway men have no choice as to those with whom they work, and should not suffer for their incompetence or negligence. (115.)

Mr. MOSELEY is scarcely in favor of the proposal to make the employer liable for all injuries or deaths, however caused, and even though due to the fault of the employee himself. Men should understand that they owe care and caution not only to themselves, but to their employers. But employers should be held responsible for using unsafe appliances, or employing incompetent men to manage or direct. In the case of railways, trackmen and laborers, at any rate, should not be held fellow-servants of trainmen. (32.)

While Mr. Moseley would not favor action by Congress without the fullest investigation, he believes that a national law defining the liability of railways for injury to their employees would be desirable. Railway men are engaged in a semipublic employment. The courts hold nearly all railways to be engaged in interstate commerce, so that the Federal courts are those in which damage suits are usually tried. Experience shows that the decisions of these courts are very conflicting and even unjust, and unless Congress deals with the subject this judge-made law will continue largely to govern these cases. The following bill has been drafted for this purpose (31, 40.)

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the provisions of this act shall be held to apply only to common carriers engaged in interstate and foreign commerce and to their employees engaged in the service of such common carriers as such.

"SEC. 2. That where, after the enactment of this act, personal injury is caused to an employee by reason of the negligence of any person in the service of the employee's employer, the employee, or, in case of his death, his representatives, shall have the same rights to compensation and remedies against the employer as

if the employee had not been an employee of, nor in the service of, the employer, nor engaged in his work: *Provided*, That an employee or his representatives shall not be entitled under this act to any right of compensation or remedy against the employee's employer in any case where the employee knew of the negligence which caused his injury and failed, without reasonable excuse, to give or cause to be given within a reasonable time information thereof to his employer, or to some person superior to himself in the service of his employer; but nothing contained in this proviso shall apply to any case where such employee is injured contrary to the provisions of the act to promote the safety of employees, and so forth, approved March second, eighteen hundred and ninety-three.

"Sec. 3. That a contract whereby an employee relinquishes any right under this act shall not, if made before the accrual of the right, constitute a defense to any action brought for the recovery of compensation under this act."

The chief officers of the leading railway orders also favor the passage of the above bill. (762.) Mr. ARNOLD, secretary and treasurer of the Brotherhood of Locomotive Firemen, takes the same position. (764.) So do also Mr. WILSON, of the Brotherhood of Railroad Trackmen, and Mr. ROXEMUS, of the Brotherhood of Railway Carmen. The latter declares that the effect of such a measure would be to force employers to exercise the greatest care in selecting fit men. (766, 769.)

Mr. MURPHY, an attorney at law of Denver, thinks that a uniform law making all common carriers liable for the negligence of a fellow-servant would not be unjust to the employer, since he selects and directs each employee, while the employee has no choice as to his fellow-servants. (780.)

Mr. CALLAWAY, president of the New York Central, thinks that railways would not object especially to being made liable for injuries to employees through negligence of their fellow-servants, provided a similar liability were imposed upon other classes of employers, and provided a reasonable limit of liability were fixed. As the law now stands, persons injured often recover damages through the sympathy of juries, and frequently to excessive amounts. (222, 223.)

6. *Uniformity of decisions.*—Mr. MOSELEY states that in the case of the Baltimore and Ohio Railway Company *v.* Baugh the railway company claimed citizenship in Maryland by virtue of its incorporation in that State, and hence obtained a removal to the circuit court of the United States from the State courts of Ohio, where the accident occurred. By section 721 of the Revised Statutes, the laws of the several States must be regarded as rules of decision at common law in the United States courts, unless a Federal law provides otherwise. The lower courts in this case followed the rule of law in Ohio as settled by the State courts, in the absence of statute, and granted damages for the injury. This was overruled by the Supreme Court, which held that there is no common law for the Federal courts, but that there is a "general law" to be settled by the United States courts, with no obligation to follow the decision of State courts. Justice Field dissented vigorously from this decision. He declares that the court had previously, in *Wheaton v. Peters*, held that there was no such thing as the "general law" of the country. The justice of the claim by which a corporation, by a mere fiction as to its citizenship, removes a case to the Federal court is also denied. The witness calls attention to the fact that had the employee been injured on a railroad paralleling the Baltimore and Ohio, but owned by an Ohio corporation, he would have obtained damages. A foreign corporation, simply by being such, escapes the obligation of the Ohio common law. Several Federal judges have officially referred to the decision as being against the trend of former cases. The decisions of Federal courts themselves have been very conflicting, and this last decision makes more conspicuous the need for a uniform definition of liability by Federal statute. (29, 30, 40, 41.)

In the absence of such a uniform Federal statute Mr. Moseley thinks that advantage would come from the passage of such a bill as the following:

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the decisions of the courts of last resort in the several States shall, except where the Constitution, treaties, or statutes of the United States otherwise require or provide, be regarded as rules of decision in trials at common law in the courts of the United States in cases where such decisions apply, and no distinction in this regard shall be made between cases involving questions of general and those involving questions of special or local law."

The chief officers of the leading railway brotherhoods also express themselves in favor of the bill proposed by Mr. Moseley. They doubt the possibility of taking jurisdiction entirely away from the Federal courts, but think that the decision of some one court should be made the rule and followed in all cases to which it can be justly applied. (762.) Mr. ARNOLD, of the Brotherhood of Locomotive Fire-

men, is also in favor of this bill (764); while Mr. RONEMUS, of the Brotherhood of Railway Carmen, believes that the Federal courts should as far as possible follow the decisions of the State courts. (769.) Mr. SARGENT also advocates this law and thinks it would be of great benefit to railway employees. (93.)

Mr. CLARK says that he and the organization which he represents—the Order of Railway Conductors—favor the act for requiring Federal courts to conform their decisions to the State laws and decisions. (115.)

7. *Employers' liability in Great Britain.*—Mr. MOSELEY says that prior to 1880 the common-law doctrine of liability obtained in Great Britain. By the act of that year the employer was made liable for injuries to workmen caused by defects of machinery, by negligence of a person in the employer's service intrusted with superintendence or authority over the injured person, by any act or omission in obedience to the orders or by-laws of the employer, or by the negligence of any person in charge of a railway signal. This act is still in force. In 1893 a bill sought to extend liability to include all acts of fellow-servants, but it failed of passage. The workmen's compensation act of 1897 makes the employer liable for all injuries, even if purely fortuitous, unless caused by serious and willful misconduct of the employee injured. The amount of compensation for different cases is fixed. Contracting out is prohibited. Most employers have insured themselves against accident, the rates of insurance being considerably raised. (28, 29.)

K. *Relief funds and departments maintained by employers.* 1. *Description.*—Professor JOHNSON, of the University of Pennsylvania, testifies that six leading railways—the Baltimore and Ohio, Pennsylvania lines, east and west of Pittsburg, Burlington, Reading, and Plant systems—have relief departments for the insurance of employees against accident and sickness. Previous to the United States arbitration act of 1898, contribution to these by employees was compulsory on three of the lines. It is still practically compulsory, since those who do not join are discriminated against in the conditions of employment. The contributions of members range from 75 cents to \$3.75 per month, the former sum securing a death benefit of \$250. Benefits for accident and sickness range from \$1 to \$1.50 per week. The railways themselves pay the expense of administration and supply any deficit. Their proportion of the total cost ranges from 16 to 20 per cent.

Under these arrangements the employees contract that the benefits paid shall offset any damages for injury or death, and this contract is usually held legal by the courts. The system is thus an economical one for the railways, and the more so because it gives them more control over their employees, especially in time of strike. Nevertheless, the railways often make additional contributions in particular cases of accident, and they often give injured employees some position not requiring hard labor. The examination of employees as a condition of membership in the association has also been beneficial. The cost of insurance under this system and in the railway brotherhoods is practically the same, but the latter method is to be preferred for other reasons. The railway relief departments tend to prevent their members from joining the brotherhoods on account of the expense of double insurance. There are also certain relief associations of a more voluntary nature formed among the employees of certain other railways; thus there are six in New England.

Perhaps the dominant motive of the railway companies which have established benefit funds is to hold their employees more closely under control. In time of strike the employee is in doubt whether to remain with the company or to act with the union, often sacrificing his rights in the benefit fund. However, it is usually provided that the employee can continue his payments and retain his right for 9 months while he is out of the employ of the company. (57-60.)

2. *Compulsory contributions.*—Mr. SARGENT, of the Locomotive Firemen, says that it is impossible to secure evidence that the present law prohibiting compulsion of employees to contribute to relief funds is violated. Contribution to the fund is not now made an open condition of employment, but if an applicant refuses to join the relief association, when it is called to his attention at the time of his application, he has no way of knowing but this is the reason for refusing to give him work. The Pennsylvania Railroad has always had a nominally voluntary association. The more subservient employees are inclined to join it, and, as in the case of other roads, they may be given the impression, rightly or otherwise, that they will be promoted more rapidly by doing so; but an independent man is not compelled to join the association—hundreds of them do not—and they may prefer to risk fewer chances of promotion for the sake of being free. Some railways consider the brotherhoods injurious to their interests and use this method of influencing employees to stay out of them. (67, 89-91.)

Mr. ARTHUR, of the locomotive engineers, says that railway employees prefer insurance in their own organizations rather than in those controlled by railway

companies, but the complaints concerning the companies' funds are not very definite or general. When the relief system was first established by the Pennsylvania Railroad there was strong opposition to the compulsory feature, and this was afterwards abandoned. The witness has heard no complaints concerning the system on that road. There have been some complaints as to the Baltimore and Ohio, but the witness knows of men who have secured employment on that road without being required to join the benefit association, and has heard no complaints from these men. The railway funds have, however, kept many from taking insurance in the brotherhoods. (121, 122, 125.)

Mr. WILSON, of the Railway Trackmen, says that some trackmen have declined to join their brotherhood because they were compelled to pay for insurance maintained by railway companies, and could not afford to insure twice. On the Plant System there is little opportunity of securing employment unless one also applies for membership in the insurance association. (47, 48.)

Mr. MOSELEY, secretary of the Interstate Commerce Commission, says that prior to the United States arbitration act of 1898 employees were virtually required to contribute to relief funds as a condition of employment. Coercion in this regard was prohibited by that act, and the witness does not believe that any force, as contemplated by that act, has since been exerted. (31, 32.)

Mr. COWEN, president of the Baltimore and Ohio Railroad, discusses somewhat fully the nature and effect of the relief system of that road. The employees and the railway jointly contribute to a fund for providing relief. When the system was first established it was not compulsory for men to enter the relief department, but employees who now enter the service must agree to join. No change has been made since the act of 1898. There is no compulsion, since an applicant need not take employment unless he chooses.

As a matter of fact, the system is approved, the witness declares, by 99 per cent of the men. The relief department was formerly a separate corporation. The charter of this corporation being repealed, it was reorganized as a voluntary association. There was no compulsion upon the men to enter the reorganized department, but fully nineteen-twentieths of the members did enter it of their own free will, after ten years' previous experience. No complaint is heard that those who are outside the department are not placed in the line of promotion. The effect of the entire system upon the relations of employer and employee is very good. Litigation has been practically wiped out by this arrangement. (304-308.)

3. *Exemption from liability through relief departments.*—Mr. WILSON thinks that railway companies having relief departments should not be permitted to manage them in such a way as to prevent injured employees or their heirs from collecting the amount of damages to which they are justly entitled. By way of illustration, the witness declares that the Atlantic Coast Line has recently organized a relief department charging \$36 per year on \$1,000 insurance, with provision for a small weekly benefit. The employee is thus required to pay exorbitantly for insurance, and in order to collect the insurance must sign a release relieving the company of liability. The injured person is not altogether deprived of the right to sue for damages, but can not do so if he accepts benefits from the fund. (767.)

Mr. RONEMUS, of the Brotherhood of Railway Carmen, also declares that participation in any relief fund should not bar an employee from collecting damages for injuries. Most relief associations are more expensive than the same amount of insurance outside, especially in the brotherhoods. This witness also objects to the relief departments on the ground that applicants for employment may be rejected because they can not pass the rigid examination required for entering relief departments. (770.)

Mr. SARGENT declares that although the employers contribute somewhat to these funds, the employees pay practically the full cost of insurance. This system is bitterly opposed by the employees, because of its paternalism, because of the forfeiture of sums paid in by change of employment, and because of the compulsion to contract to exempt the employers from liability, notwithstanding that the employees have paid the full value of the insurance. (67.)

Mr. COWEN admits that on the Baltimore and Ohio the employee is required to sign a contract when he accepts relief from the relief department that he will not sue the railway company, although there is no agreement made in advance not to sue.

The attention of the witness being called to the section of the United States arbitration act of June 1, 1898, which prohibits employers from making it a condition of entering employment that the applicant shall agree to contribute to any such fund, or that he shall release the employer from legal liability for injury to an amount exceeding the proportion of the relief fund contributed by the

employer, Mr. Cowen declared that no change of practice had been made by his company since that act. If the act aimed to prevent railroad companies from making agreements with their intended employees as to contributing to a relief fund, the act is invalid, and the only way to test its constitutionality is by not complying with it. As a matter of fact the railway is in no sense released from liability. The requirement is simply that when the employee accepts payment from the relief fund he must give an absolute release of further liability. This contract is not made in advance, and if he prefers to take his chance, he can sue for damages. Although the railway company itself contributes directly only from one-sixth to one-fifth of the payments to the relief fund, the service which its clerks and officers perform in managing the business of the fund is an important contribution. (304-308.)

4. *Savings fund, Baltimore and Ohio.*—Mr. COWEN also describes the savings-fund system which has been established by the Baltimore and Ohio Railroad. There are few savings banks in the region through which this railway passes. Employees are allowed to make deposits with the company. On this they are guaranteed 4 per cent. The moneys deposited are loaned to employees, chiefly for the purpose of building homes. The fund has been so prosperous that during 1899 the depositors received interest at 5½ per cent, and hundreds of employees have obtained homes through this system. The deposits at the end of the fiscal year 1899 were \$1,168,000, the deposits made during that year being \$393,000. The fund is managed by the officers of the railroad without expense to the depositors. (306.)

L. *General conditions of labor—Miscellaneous.*—1. *Labor on Illinois Central.*—Mr. FISU says that the Illinois Central and the Yazoo and Mississippi Valley Railroad have 28,750 employees. Men are employed regardless of membership in labor organizations. Pains are taken to keep them from working too many hours without proper sleep. Rules regarding intoxication are strictly enforced. On one division of the road a hospital has been established by the company, and is maintained by assessments on the men, which are, however, voluntary. The companies expected to conform to the law regarding safety appliances by January 1, 1900. (333.)

2. *Labor on Chicago Great Western.*—Mr. STICKNEY, president of the Chicago Great Western Railway Company, says that his road has had no special difficulties in the way of strikes. It never hesitates to treat with organized labor. The usual hours of work, except for trainmen, are 10 per day. Trainmen work by the hour. It is not the intention of the company to have the men work on Sundays more than is absolutely necessary. There is no provision for a fund for sickness or disablement. (455.)

3. *Railway trackmen.*—According to Mr. WILSON, grand chief of the Railway Trackmen, the road masters on the railways are the heads of employment, except where the trackmen are very thoroughly organized. They can employ and discharge men at will. Partly from necessity, in order to secure the approval of their superiors, they are inclined to be severe with their men. The road masters and foremen are harmonious in their relations, but often have little care for the track laborers. The chances for promotion to positions as foremen are fair, but road masters are often civil engineers without previous practical railway experience. It requires several years to become a thoroughly efficient track hand. The Brotherhood of Railway Trackmen is doing much to promote harmony between these different classes. (52, 54.)

There are about 180,000 men employed in maintaining the tracks and roadbeds of American railroads. Of these about 2,000 are road masters, covering from 100 to 150 miles of track each. About 30,000 are section foremen, each covering a few miles of track, for which he is personally responsible. These men are almost always faithful to duty, and few accidents occur through their fault. The trackmen are employed by these foremen. Scarcely half as many are employed in winter as in summer. The trackmen are paid exceedingly low wages. The witness believes that 90 per cent of them are American citizens. On the Pacific coast some Chinamen are employed, and in New England there are many foreigners, but elsewhere nearly all are Americans. (45, 46, 50.)

4. *Switchmen.*—Mr. O'ROURKE states that the wages of switchmen in Chicago are 25 cents an hour for what is called plain switching during the day and for helping, and 27 cents at night. Some of the railroads work their men as little as 10 hours a day; some 11, many 12, some 15 and 16. There is no complaint about the long hours; if there were, the men might change to shorter runs. Some prefer to work the long hours and make more, and others would rather have less and work only 10 or 11 hours. There has been no change in switchmen's wages in 4 or 5 years. More men are now employed on account of the increased business,

and the men are working more hours. The switchmen's wages are entirely satisfactory, and the switchmen have had no grievances of any kind against the railroads. (530.)

Mr. O'Rourke supposes that there are 900 to 1,000 switchmen in Chicago. He does not believe that a quarter of them are members of the switchmen's union. Many of them are members of other organizations—the conductors' organization and the trainmen's organization. These are men who were out of work in their own line and who came to Chicago and got employment as switchmen. (530.)

5. *Car repairers.*—Mr. RONEMUS, grand chief of the Brotherhood of Railway Carmen, states that repairers of cars are subjected to many inconveniences and hardships. Loaded cars are often in need of repair and are repaired on the track, usually without any shed or other covering. The men are required to keep at work constantly, regardless of rain, sleet, and all other conditions of the weather. Railways should be required to erect suitable sheds over at least part of the repair track. (770.)

6. *Relations of employer and employees.*—Mr. O'ROURKE, switchman, of Chicago, believes that the interests of railroad labor will be best furthered by closer association between employer and employee; that all forces which tend to cause hostile feelings between them are wrong, and those who encourage such feelings are the foes of labor. He hopes that the time has come when there will be no such thing as a strike. He and his associates look for industrial peace. Organized railway labor to-day offers no shelter to the agitator. The policy of the switchmen's unions in Chicago is to exclude agitators from membership. (526, 527, 529.)

Mr. MOSELEY, secretary of the Interstate Commerce Commission, says that most railway managers are progressive men and have done much in the interest of their employees. They have established hospitals, relief funds, Young Men's Christian Associations, etc. The American Railway Association and the Master Car Builders' Association have recommended the best safety appliances and regulations; but in the absence of law some few employers refuse to perform their duties properly. The managers feel a certain opposition to restraint, but the public has a clear right to regulate enterprises to which they have given such great privileges as to railways. (43, 44.)

Mr. CLARK, of the Railway Conductors, says some of the most serious disputes as to labor matters have occurred on roads operated by receivers. The railway men believe that reductions in wages have been undertaken which would not have been tried if the support of the Federal courts had not been expected. (116.)

7. *Profit sharing, etc.*—Mr. INGALLS, president of the Chesapeake and Ohio, declares himself strongly in favor of profit sharing as applied to railways. The plan of the Illinois Central in getting the men to buy stock is perhaps somewhat dangerous, because stocks go up and down in value. It is preferable to let the wages paid be considered as representing a certain capital, and make a payment upon that capital out of profits. This practice creates better feeling among the men, secures better work, and checks trouble with strikes. The difficulty so far has been that railways have been too poor to be sure of paying regular dividends. (290.)

Mr. FISH, president of the Illinois Central Railroad, says that it is the practice of that company, on the first of each month, to authorize the sale of one share of stock to each employee at the current market price. Payment may be made by installments in sums of \$5 or multiples thereof. Interest at 4 per cent is allowed on partial payments. The number of employees thus holding stock is 705, and their holdings amount to 2,554 shares.

The general ownership of stock in the Illinois Central is widely distributed. The average holdings of each investor are from 85 to 90 shares. Much more than a majority of the stock is held by the 5,194 persons who own less than 100 shares each, the total number of stockholders being 6,526. A block of 40,000 shares is held by a group of Dutch investors, who issue certificates in the Dutch language based upon them. (325-327.)

Mr. SARGENT, of the Locomotive Firemen, says that the system by which the employees of the Illinois Central Railroad are permitted to purchase stock at special rates has been taken advantage of by many employees. It is generally considered acceptable and is promoting harmonious relations. The man who has an interest in a business will naturally be more devoted to its success. (92.)

8. *Railroad Y. M. C. A.*—Mr. CALLAWAY states that branches of the railroad Y. M. C. A. are located at nearly all the large terminal stations and yards of the New York Central Railway. The buildings have often been furnished by the railroad company, and Mr. Vanderbilt has frequently furnished libraries and other facilities. The secretaries are usually paid by the company. Many employees

have homes of their own, but a large proportion of the others avail themselves of the privileges of the Y. M. C. A. Lodgings and meals are provided at low rates; there are bath rooms, reading rooms, and other conveniences. (220.)

9. *Colored labor.*—Mr. SPENCER, of the Southern Railway, testifies that colored men are employed as trainmen and firemen, but not as conductors and engineers, and scarcely at all as switchmen. Their wages are usually about 10 per cent less than those of whites doing the same work. (266, 267.)

Mr. ARTHUR, chief of the Brotherhood of Locomotive Engineers, says that by action of the convention of this organization in 1873 colored men were made ineligible for membership. They are opposed by the white members in the South, where the organization has a large constituency, and they are also less competent than white men. (118, 119.)

XIII. LAKE TRANSPORTATION.

A. *Volume and character of traffic.*—Mr. KEEP, secretary of the Lake Carriers' Association, states that the great item of freight on the lakes is ore. This business has increased immensely in the last few years. The total shipments of iron ore by lake during 1899 were 17,901,000 gross tons, of which 4,101,675 tons came from Lake Michigan ports, and the rest from Lake Superior. The total traffic through the Soo Canal in 1899 was 25,255,810 tons, of which about 60 per cent was ore. Of the grain traffic, probably about 80 per cent goes to Buffalo, the remainder going to the Georgian Bay, to Erie, to Ogdensburg, and down the St. Lawrence. In 1899 the grain receipts at Buffalo were 153,000,000 bushels, besides 10,000,000 barrels of flour. In 1898 they were 204,000,000 bushels of grain and 12,500,000 barrels of flour. The falling off was due principally to the labor controversy at Buffalo in May, which shortened the season, and the very high rates which prevailed for carrying iron ore, so high that the railroads were able to compete actively in the carriage of grain.

The east-bound movement of freight on the lakes is two or three times as large as the west bound. The most of the boats return west light. Coal is the only large item of west-bound shipment. There was shipped last year from Buffalo 2,648,425 tons of anthracite coal by lake, and 126,140 tons of bituminous. These figures include shipments to all ports, but the greater part goes to various American ports. The most of the bituminous coal that is shipped by lake goes from Cleveland, Toledo, and Ashtabula. No coal is received from Canada into the United States by lake; the movement is the other way. Coal is shipped on Lake Ontario, from Charlotte and Oswego and other points, to Toronto and other points in Canada. It is also shipped from Buffalo and from Ohio ports. (715-717.)

The ore boats are likely to carry a load or two of grain in the spring before the ore movement begins and another load or two in the fall after the ore movement ends. The Strait of Mackinac sometimes opens before the St. Marys River, and boats can go from Chicago with a load of grain earlier than from Lake Superior with ore. In the fall the ore freezes in the ore pockets, and it becomes difficult to load vessels, whereas grain can still be loaded from the elevators. (717.)

Loading and unloading.—Since lake vessels are in commission only about two-thirds of the year, the question of dispatch in port is of very great importance. The machinery for loading and unloading has been greatly improved within a few years. A vessel now reaches Buffalo with 260,000 or 270,000 bushels of wheat in the morning, and is unloaded, gets a load of coal, and leaves the same night. (721.)

Opening of navigation—Insurance.—Mr. KEEP states that the lake season begins with the opening of the Strait of Mackinac—about the 20th of April. Insurance begins when the strait is reported open. Insurance policies expire at noon on some specified day—some on December 1, some on December 5, some as late as the 12th. If the vessel is on a voyage at that time the insurance covers her until she completes the voyage. (721.)

Navigation laws.—Mr. KEEP states that the navigation laws forbidding the participation of foreign vessels in the coastwise trade of the United States apply to lake commerce. He does not consider that these laws are of much value to the lake-vessel owners, since even the commerce between American and Canadian ports is almost entirely in the hands of American vessels. During 1899 American vessels carried about 97 per cent of the freight through the St. Mary's Falls Canal. (722, 723.)

B. *Character of vessels—Amount of tonnage.*—Mr. KEEP says that the ordinary lake vessel is built to carry bulk freights—coal, ore, lumber, or grain. The transportation companies affiliated with the railroads own what are called package-freight boats, built with an extra deck, giving a place between the decks, in which

package freight or miscellaneous merchandise is carried for the lake-and-rail route. There boats also have a hold in which they carry grain or coal. A few other owners have built their boats with decks, so that they may charter them for the season to some of these companies that are short of boats. But this custom is rather disappearing, since the great object of the lake-vessel owner in building a boat is the speedy handling of cargo, which is hindered by decks. (714.)

Alexander McDougall invented the whaleback, and interested some New York capitalists in a shipyard. A fleet of about 30 boats was built, under the name of the American Barge Company. No other company has built whalebacks. This company is now building one boat which is not a whaleback. No whaleback is at present under construction. These boats are not by any means the largest on the lakes. The witness thinks Mr. Rockefeller had some interest in the whaleback enterprise, and it is understood that he has bought the whole fleet since the close of navigation in 1899. (714, 718.)

Tonnage.—Mr. KEEP states that the total number of vessels on the lakes was 3,162 on June 30, 1899, out of a total of 22,728 vessels of all kinds in the United States. The tonnage on the lakes was 1,446,318 tons, against 2,614,869 tons on the Atlantic and Gulf coasts, 539,937 tons on the Pacific coast, and 263,084 tons on the Western rivers; a total of 4,861,238 tons. A little less than one-third of the whole tonnage of the country is on the lakes. In 1886 there were 6 steel vessels on the Great Lakes; in 1891 there were 89; in 1899 there were 296. (713, 718.)

Mr. KEEP states that at the time of his testimony, February 19, 1900, there were building in the lake shipyards vessels of a capacity of 185,500 tons and a cost of \$8,902,000. This is the greatest tonnage and the greatest value of ships ever built on the lakes in one year. In 1898, at the same time, vessels were building of 71,400,000 tons capacity and of a value of \$2,974,000. Among those now under construction are two boats larger than were ever launched on the lakes, namely, 498 feet long, with an estimated capacity in gross tons on 18-foot draft of 7,900 tons. The boats building are practically all of steel. Nearly all the shipbuilding is in American yards; only some \$100,000 out of the total of \$8,900,000 is Canadian. The largest cargo brought from the upper lakes to Lake Erie down to 1891 was 3,527 tons, and the largest cargo that passed through the St. Marys Falls canal in 1899 was 8,245 tons. The advantage of the large boat is that with a comparatively small increase in the crew and in the expense of running the carrying capacity is greatly increased. (715, 718, 719.)

Mr. CARTER also states that the tonnage of lake shipping will be much increased during the coming year. Several carriers of the largest size are building. It could not be otherwise, since the lake carrying business has been very remunerative during the past year, and boats have made contracts during the last few months to carry ore at one-third of what it can be carried for by rail. (581.)

C. Ownership of vessels.—Mr. KEEP, secretary of the Lake Carriers' Association, states that out of about 600 vessels in the association 72 are owned or controlled by companies having affiliations of some kind with the railroads. These boats have a net registered tonnage of 122,000 out of a net registered tonnage in the association of 760,000. Mr. Keep gives in detail the names of the lake transportation companies which are affiliated with the several roads. The Standard Oil Company has one tank boat on the lakes, carrying oil in bulk from Chicago to Duluth. Mr. Rockefeller owns the Bessemer Steamship Company, which has quite largely handled the Carnegie ore. It is understood that Mr. Rockefeller has recently bought the whole whale-back fleet of about 30 boats. The Carnegie people are now building about half a dozen boats. Many mining companies have affiliated companies which own ore-carrying vessels. Very few vessels are now owned by individuals. Vessels are becoming too large and expensive. No boats are sailed by their owners except some of the smaller lumber schooners. Boats are owned by groups of men who frequently form a separate corporation for each boat, though the ownership of several boats may be identical. (713, 714, 716.)

Mr. CALLAWAY testifies that the New York Central owns a line of lake boats running to Milwaukee, Chicago, and Duluth. An attempt is made to agree with leading competitors as to rates, but the chief competition is from tramp steamers, and the company is practically compelled to meet their rates. Although Chicago is about as far from Buffalo as Duluth, the Duluth rate must be higher in order not to ruin intermediate rail business. (239.)

D. Passenger boats.—Mr. KEEP, secretary of the Lake Carriers' Association, states that the Great Northern Railroad has two passenger boats nearly 400 feet long, and costing about \$800,000 each, running between Buffalo and Duluth, and making a round trip of 2,000 miles in 6½ days. They do not carry any freight. Their season is very short, only from June to September; but during the season they are

crowded. There are other boats which do a large passenger business in connection with the package-freight business, as between Buffalo and Cleveland, between Cleveland and Detroit, and night service between Detroit and Mackinaw, Chicago and Mackinaw, and Chicago and Milwaukee. The only international service, except that on the St. Lawrence River and the ferry service at Detroit, is that of one or two boats daily in the summer between Toronto and the mouth of the Niagara. (720.)

E. Freight rates and methods of business.—Mr. CARTER, a grain shipper of Chicago, states that a large number of different persons own vessels on the lakes, and that there are usually several people with whom a shipper may contract. A boat is generally chartered and loaded with grain by one shipper. The shipper may contract with the owner, but usually contracts with the vessel agent, who arranges before the boat comes in to have a load ready as soon as the boat can take it. A great deal of package freight is transported on the lakes, such as flour and pork. It is carried largely on the regular lines, and the business is done very much as similar business is done on the railroads. (581, 582.)

Mr. KEEP states that on ore the freight rate is now largely a season rate made on contracts. On grain the rate fluctuates from time to time, according to the supply of boats and the demand. The rate fluctuates so rapidly and the amount of business done at different times and under different rates varies so much that it is very difficult to make a fair average of the rates for the season. (719.)

Combination on freight rates.—Mr. KEEP says that there was some talk two or three years ago, during a very dull season, of an effort to get the vessel owners to agree on a minimum freight rate; but it was given up as impossible. The witness never heard of any other attempt to control lake freight rates. Mr. CARTER also says that there has never been a successful combination to maintain rates upon the lakes, and he does not think that anything of the kind would be possible at present. (581.)

Statistics of rates.—(See also under *Railway Freight Rates*, p. 39).—Mr. KEEP states that it is difficult to give the rate on wheat to Buffalo, as most of it is contracted through at a rate which includes both lake and rail, and it is impossible to say what the rail rate east of Buffalo is. He, however, states the highest rate from Chicago to Buffalo for 1898 as $3\frac{1}{4}$ cents per bushel, and the lowest as $1\frac{1}{4}$ cents, with an average of $1\frac{1}{2}$ cents for the season; and for 1899 the highest $3\frac{3}{4}$ cents, the lowest $1\frac{1}{4}$ cents, and $2\frac{1}{2}$ cents the average. In 1891 the rates on ore from Lake Superior ports to Lake Erie ports varied from 90 cents to \$1.50 a ton, the average being about \$1.15 or \$1.20. In 1898 most of the ore was brought down at 65 cents. The vessel has to pay for loading and unloading out of these freights.

1897 and 1898 were dull years, but in 1899 the smaller boats had perhaps as prosperous a year as they ever had. The larger vessels had made contracts which compelled them to carry throughout most of the season at a low rate. Many of the smaller vessels which took their chances on getting cargoes from trip to trip got exceedingly high rates. The variation was as great as between 60 cents a ton, the season contract rate, made in the winter of 1898 and 1899, and \$2, the rate which prevailed for some time during the season of navigation. The owner of a vessel that carries 1,000 tons or 2,000 tons may very well take his chances on getting cargoes from trip to trip, but a boat of 7,000 tons or 8,000 tons can not so easily pick up loads, and safety requires that such boats should make contracts in advance. (714-717, 719, 722.)

Mr. CARTER states that within the last two years coal has been carried from Buffalo to Chicago as low as 20 cents per ton; a great deal has been carried at 25, 30, and 35 cents. Ore has been carried from Lake Superior ports to Buffalo for 40 cents, and large contracts have been made at 45 cents. During this year the maximum rate for ore was \$2. (581.)

Lake transportation and rail transportation.—Mr. KELLEY, freight commissioner of the Trades League of Philadelphia, considers that the practice of the railways in greatly reducing their freight rates during the season of navigation on the Great Lakes in order to compete, especially in the transportation of grain, is likely to result ultimately in driving the lake vessels out of business, after which rates will be put up and kept up. The same practice in regard to river and coastwise transportation has had the effect which he fears in this case. It is true that the railways themselves own lines of lake boats which they operate in conjunction with their land lines. This practice itself has some dangers, since water transportation is not under the Interstate Commerce Act and railways owning boats may thus make discriminations on through traffic. But most of the steamers owned by the railways are regular lines carrying general merchandise of high class, paying higher rates of freight. Wheat, ore, and similar bulky products, having low freight rates, are largely transported in full cargoes by tramp steamers built especially for such

traffic, and it is against these that the cuts in railway rates are injurious. Railways sometimes carry freight at a loss for the purpose of competing with water traffic, depending on higher-class commodities for their profit. This is probably true in railway competition with the Erie Canal. (188, 189.)

Mr. DOUSMAN, a grain shipper of Chicago, does not believe that freight rates on the trunk lines have been made low through the competition of lake carriers so much as through competition between the railroads themselves. Each of the great railway lines east of Buffalo has its own line of lake steamers, and the witness knows of no regular independent lake lines, although there is usually little trouble in chartering tramp steamers. The lake freight rates have been very low for several years. The rate in 1899 was only 2 cents per bushel on grain, and it has been as low as 1 cent. There is considerable danger that independent lake boats would be driven out of business by the lines controlled by railways if it were not for the competition of the Erie Canal with the railways from Buffalo to New York. (357.)

Mr. KEEP, secretary of the Lake Carriers' Association, states that the railroads do not make as much difference in their rates as formerly between the season of navigation and the winter season. (718.)

F. Grain shipments—methods, routes, etc. (see also as to *Export rates*, p. 69 ff.).—Mr. WEBSTER, president of the Armour Elevator Company, says that the cheapest route for grain shipment from Chicago is usually by way of the Great Lakes, although frequently the railroads are forced to cut their rail rates to meet the water rates. The favorite routes are from Chicago to Buffalo and thence by the Erie Canal or by rail to New York, Boston, and Philadelphia; from Chicago to Erie and thence to Philadelphia or Baltimore; from Chicago to Fairport, Ohio, and thence to Baltimore; from Chicago to Port Huron, Sarnia, Owen Sound, and other Lake Huron ports, and thence by rail through Canada to Montreal, St. Johns, Portland, or Boston; from Chicago by the Great Lakes and the Welland Canal to points on Lake Ontario and thence by barge down the St. Lawrence to Montreal or by rail to Portland or Boston. A new and very advantageous route has recently been established, by water to some port on Lake Huron, thence by rail to Coteau Point, from which the grain is carried by barges to the ocean vessels at Montreal. The Erie Canal at present to some extent regulates rail rates east of Buffalo, but the limited capacity of the boats, not equal to more than 15 per cent of the grain passing through Buffalo, makes this influence less important than is often supposed. If the canal is enlarged more and larger boats will be built and the canal will mainly control transportation rates. The Canadian routes are at present the cheapest, and only lack of ocean tonnage has prevented Montreal from doing still larger business. The witness thinks that the United States Government should use its best efforts to improve the water routes from the West to the seaboard. (412.)

Mr. CARTER, of Chicago, commission merchant, states that the slowness of the increase of the through shipments of grain to New York by lake and canal is due to the fact that the Erie Canal is not in condition to handle the trade. Much grain that is shipped to Buffalo by water is forwarded from there by rail. In 1898 the greater part of the grain left Chicago by water. This was not true in 1899, because of the low rates for export by rail. (578, 579.)

Mr. Carter states that water transportation offers great advantages over the best facilities that the railroads can furnish. For the year 1897 the average all-rail rate from Chicago to New York on corn was 11.43 cents per bushel. During the season of navigation of that year the average rate by lake and canal, including the charge at Buffalo, was 4.53 cents per bushel. For 1898 the average all-rail charge on corn was 9.8 cents, and on wheat 12 cents. The average charge by lake and canal, exclusive of charges at Buffalo, was 3.81 cents on corn, and 4.45 cents on wheat. The charges at Buffalo for this year are excluded because they were very irregular, and a fair average can not be obtained. They ran from three-fourths of a cent to nothing. On the amount of grain exported during the year 1898, the difference between the all-rail charges and the lake-and-canal charges would be about \$25,000,000. A great deal of grain is shipped to Buffalo by lake and thence by rail. This is cheaper than shipping all rail, but not so cheap as shipping all water. During some years the rail rate is cut very close to the water rate during the season of navigation; and in other years it is not. During the 20 years past the average rail rate has been at least 25 per cent higher during the winter than during the season of navigation. (578, 579.)

Mr. Carter says that he buys the most of his grain in Chicago and sells much of it there. His trade has always been largely confined to Illinois. Since his shipments are rather small they go mostly by rail. For a single carload, which is regarded as a retail shipment, railroad transportation is the most desirable

because, among other reasons, by this means the identity of the shipment is preserved. (582.)

Mr. TUCKER states that the rate from Chicago to Buffalo has been as high as 3 and 4 cents a bushel during 1899; in 1898 it was three-fourths of a cent. (558.)

Buffalo transfer charges and elevator combination.—Mr. KEEP, secretary of the Lake Carriers' Association and of the Buffalo Merchants' Exchange, states that the elevator charges on grain at Buffalo had never been less than seven-eighths of a cent per bushel before 1898. In 1898 there was no combination of elevators and no fixed rate. In 1899 an elevator combination was again formed and the rate was made one-half cent per bushel. The present elevator association includes only working elevators which have rail connections. Houses that are not working or that are on islands and can only unload into canal boats have not been taken in. The association is a pooling arrangement. Some of the elevators in it are owned by individuals, some by companies, and some by railroads. The association elevators did almost all the business in 1899, though a few canal houses which were not taken in did a little business in loading grain into canal boats. (721.)

G. Lake Carriers' Association.—Mr. KEEP states that the Lake Carriers' Association began some 14 or 15 years ago in the joining of a few vessel owners, chiefly of Buffalo, to forward their common interests in such matters as the building of needed lighthouses and legislation with reference to channels. About the same time the Cleveland Vessel Owners' Association was formed at Cleveland. Its purpose was slightly different: it was largely to look after business matters connected with the running of boats, and particularly the supplying of labor. The Cleveland association opened shipping offices and put shipping masters or employment agents in charge. In 1890 a question arose in which the Cleveland and the Buffalo associations took diametrically opposite sides. Out of this arose the consolidation of the two organizations into the Lake Carriers' Association in 1891. Since that time the Lake Carriers' Association has been the only association of vessel owners on the lakes. It embraces about 600 vessels out of 3,163 lake vessels of all kinds; but its tonnage is a little over 1,000,000 tons out of 1,400,000 tons all told, and the association vessels have probably from four-fifths to nine-tenths of the freight-carrying tonnage.

The work of the association is to interest itself in legislative matters relating to the lakes, trying to get needed channel improvements and improvements in the aids to navigation, so far as they are of general concern, the supplying of many private lights, and the maintenance of shipping offices. Since Canada has a relatively small interest in lake navigation, the Canadian government does not establish sufficient lights on its side; and there are certain places on the American side where lights have been deficient. The Lake Carriers' Association has built and sustained many lights at its own expense, particularly at vital points in the St. Mary's, Detroit, and St. Clair rivers, where vessels pass through crowded, narrow channels. Some which the association used to maintain have been taken over by the United States Government; but there are at least six lights in the lower Detroit River which the association has maintained for 10 years.

The Association maintains shipping offices at Chicago, South Chicago, Milwaukee, Cleveland, Toledo, Ashtabula, and Buffalo, for the furnishing of men to vessels.

The association, as such, owns no vessels and is not engaged in the transportation business. It has never made any attempt to control or regulate freight rates. (709, 710, 713, 723.)

The fleets of the iron and steel manufacturers and also the boats owned by companies affiliated with the railroads are in the association. (713.)

Mr. CARTER, a commission merchant of Chicago, states that the Lake Carriers' Association tries to regulate wages, and looks after the interests of the lake carriers generally. It would try to fix freight rates if it could, but it has never succeeded in fixing a rate that has stood for any length of time. It does not control the tonnage of the lakes, and it has members who have no tonnage on the lakes. One of the leading men of Chicago, who has been one of its officers, has owned nothing but tugs for towing ships into Chicago. (582.)

H. Improvement of lake navigation.—Improvement of "Soo" Canal.—Mr. KEEP states that there were two blockades in the Soo River during 1899, which cost the vessels \$1,000,000 in delay. The channels are only 300 feet wide in several places. If an accident happens to a 400 or 500 foot boat which wrecks it across the channel, no boat can pass until the wreck is removed. Two plans of improvement are proposed—one to widen the channel to a minimum of 600 feet, the other to make a second 300-foot channel. The second plan is the better, because two 300-foot channels could not be blocked by a single accident, while one 600-foot channel could.

The last figures for the Suez Canal traffic are those for 1897. They amount, in ship tonnage, to 7,899,373 tons. During the same year the traffic through the St. Mary's Falls Canal was 18,982,755 tons, and in 1899 it was 21,958,347 tons, though this canal is open less than 8 months in the year. (720.)

Mr. Keep states that there was originally only about 9 feet of water in the shallow parts of the St. Mary's and Detroit rivers. The available draft is now 18 feet on an average. With this draft the largest vessels now building will carry about 9,000 tons of freight. The Government is engaged in dredging a channel to be 20 feet deep in still water and 21 feet where subject to wave action. (722.)

A power canal is building to draw water from Lake Superior or from St. Mary's River above the rapids and return it to the river below the rapids. It is proposed that this canal shall carry a volume of water equal to 50 per cent of the flow of St. Mary's River at low water. The engineer of the power company has estimated that if no compensatory works to obstruct the fall in the rapids were built, the canal would lower the level of Lake Superior 2 feet. The company proposes to build compensatory works. The Lake Carriers' Association showed, in a hearing before the River and Harbor Committee, that a diminution of 1 inch in the available draft of water in the Soo Canal and the harbors of Lake Superior would cause a loss of \$150,000 a year to the vessels. (717.)

Canal tolls.—Mr. KEEP says that the Canadian government formerly charged a toll of 20 cents per ton on all freight carried through the Welland Canal, but gave a rebate of 18 cents if the freight went to Montreal, and no rebate if the freight stopped at an American port. The United States retaliated by levying discriminating tolls on Canadian vessels at the St. Mary's Falls Canal. As a result, the rate for the Welland Canal was made uniform at 10 cents, whatever the destination of the freight. The Canadians have since completed a canal of their own at St. Mary's Falls, but the policy of discriminating tolls has not been renewed. There are no tolls at either of the St. Mary's Falls canals, to either Americans or Canadians. (723.)

Labor on lake vessels.—Lake Carriers' Association—wages card.—Mr. KEEP says the Lake Carriers' Association issues a card, called its wages card, from time to time, stating the maximum wages which the members will pay different classes of employees. Only members of the association are bound by it, and the members are at liberty to get their men cheaper if they can. The policy of the association is to pay liberal wages in good times and to reduce the wages in hard times, when the vessels can not make any money. The men seem generally to have been satisfied with the card of late years; there has been almost no controversy with labor. Wages were much higher in 1899—a prosperous year—than in 1898; and the wages card for the spring of 1900 will doubtless be higher than that of the spring of 1899. The card is changed from time to time during the season in accordance with the supply of men and the demand for them, as well as in accordance with the rates of freight. (710, 711, 719.)

Labor unions.—The Lake Carriers' Association recognizes committees from organized seamen. The men sometimes send in communications when they know that the association's wages card is about to be altered, and these communications are taken into consideration.

The labor organizations on the lakes have not been very active of late years. There are a seamen's union, a firemen's union, and an engineers' organization. (710, 711.)

Labor troubles and strikes.—Mr. KEEP states that there has been very little trouble between employers and employees since his connection with transportation on the lakes. On one occasion a few years ago the schooner *Mabel Wilson* lay at the breakwater at Buffalo with a crew of nonunion men, and a boat load of union men went out from the city and pulled off the crew and assaulted the captain. Two of the ringleaders were sent to State prison by the United States court. The witness does not know the cause of the controversy. (710.)

The grain shovelers who struck at Buffalo in the spring of 1899 were not employees of the Lake Carriers' Association. They were employees of a contractor, with whom the association had made a contract to do the necessary shoveling for the grain elevators at Buffalo for the entire season. There were two unions of the men at Buffalo, whose demands seem to have been identical. Mr. Keep does not make clear the origin of the difficulty. He states that in the end the question became one of personal animosity, and that the men declined to work for the contractor on any terms.

The grain fleet which had been loading all winter at Western ports came to Buffalo as soon as the Strait of Mackinac opened, arriving mostly on the 3d or 4th of May. The shovelers had determined that they would not work under the contract system, but would return to the system of shoveling under boss

scoopers at the different elevators, which had prevailed before the contract system was adopted. The Lake Carriers' Association adopted a resolution on May 3, declaring that the contract system had corrected many abuses, furnished good wages, saved vessels from delays and extortions, and been a marked advantage to the grain trade of Buffalo, and that the association would stand by its contractor and insist on the performance of the work under his contract. Finally Bishop Quigley, of Buffalo, undertook, primarily at the suggestion of the representative of the Lake Carriers' Association, to reconcile the contending parties. After his efforts had continued nearly a week, the following basis of settlement was signed by the representatives of the association and the attorney for the shovelers. From its terms some of the grievances and demands of the men may be inferred.

"First. That the price of \$1.85 per thousand bushels should be paid to the men actually doing the work of shoveling, with not exceeding one foreman at each elevator leg; no other person to participate therein.

"Second. Each gang to select a timekeeper from its own number.

"Third. The timekeeper and the inspector provided for at the conference to have free access to bills of lading and other documents showing the quantity of grain elevated.

"Fourth. Wages to be paid at elevator offices.

"Fifth. No bar bill or other accounts to be deducted from wages.

"Sixth. No boss or paymaster to be directly or indirectly connected with any saloon.

"Seventh. An inspector to be appointed by the bishop to see that the provisions of the agreement were carried out, and to report any violation to the bishop and to the Lake Carriers' Association; the inspector to be removable by the bishop with power to appoint another, if necessary, to be paid by the Lake Carriers' Association.

"Eighth. Bishop Quigley to have power to appoint a disinterested arbitrator to hear and finally determine complaints."

The scoopers did not, however, return to work. They alleged acts on the part of the contractor inconsistent with the agreement. The Lake Carriers' Association withdrew from further negotiations. On May 23, through the continued efforts of Bishop Quigley, a settlement was finally reached on which the men returned to work. (711-713.)

J. Canals (see also *Grain transportation*, p. 163).—*Erie Canal*.—Mr. KEEP states that the business of the Erie Canal is decreasing, and, so far as the grain business is concerned, must disappear if present conditions continue. The business is not profitable enough to justify building new boats. The number of boats in condition to carry grain decreases year by year. Even if rates advance there are not boats enough to do any large business. The canal ought to be abandoned or practically built over. A small improvement would be of no value. A State commission in New York has just reported to the governor, urging that the canal be made capable of handling boats 25 feet wide and 150 feet long, with a draft of 10 feet, and that single locks be arranged to take in two of these boats at once. The idea is that boats would travel in tows of 4,000 tons made up of 1 canal steamerboat and 3 barges. The estimated cost is about \$58,500,000 for the Erie Canal proper, and \$3,500,000 additional for the Oswego Canal. (722.)

Mr. CARTER, a commission merchant of Chicago, thinks that the Erie Canal should be improved and given a depth of at least 10 feet. He does not think that navigation of canals by the ships of the Great Lakes is likely to be brought about. These vessels are built very expensively and provided with powerful engines. Much cheaper boats would answer just as well for the slow movement along the canal, and would involve less expense. Grain should be carried on barges fitted for competing with the railroads, on which the unit is the train load, amounting now to from 1,200 to 2,000 tons of actual burden. The barge need not necessarily be of similar capacity to a train of cars, as many questions besides that of the wages necessary to handle the barge must be considered. (579.)

Chicago drainage canal.—Mr. KEEP states that the lowering of Lakes Huron and Michigan, to be expected from the Chicago drainage canal, varies from 3 inches to 7 or 8 inches in the estimates of different engineers. The most serious effect, so far as yet appears, is the effect on the harbor of Chicago itself. It is making a dangerous current in the Chicago River, and it has lowered the water in the upper part of the Chicago River 2 feet. Over the Washington street tunnel, where the draft of vessels is limited, the water is lowered about 6 inches. Improvement of the Chicago River without increasing the draft of water through the canal would be simply a harbor improvement and would not affect lake navi-

gation. The proposal to make the drainage canal navigable for vessels of light draft is of interest to the lake carriers only as it might affect the amount of water abstracted from Lake Michigan. If that amount were largely increased it would have a very serious effect on lake navigation. (717, 718.)

Mr. CARTER, a commission merchant of Chicago, says that the Chicago drainage canal is constructed with a depth of 22 feet, and is 28 miles long. He thinks the United States Government ought to take up this work and complete it, making a navigable channel from the Great Lakes to the Mississippi. A careful estimate has been made of the cost of completing a 16-foot channel from the termination of the drainage canal, through the Desplaines River and the Illinois River, to the Mississippi. The estimate is less than \$125,000,000. There is not 16 feet of water in the Mississippi up to the mouth of the Illinois, but that would be a matter for the Mississippi River Commission to attend to. The United States Government has taken charge of the Chicago River and is deepening the water there. The volume of water which the canal will carry to the Mississippi will be of great aid in giving the required depth to the Illinois River and to the Mississippi itself. Several merchants of St. Louis, whom Mr. Carter has talked with, believe that the additional water will be of great advantage to them when the Mississippi is low. Mr. Carter does not clearly advocate the 16-foot channel, but many men think it desirable that deep-water navigation be provided throughout the whole distance from the Great Lakes to the mouth of the Mississippi. Mr. Carter does not think that such a waterway would be a dangerous rival of the Erie Canal. "In some respects it would add to the volume of business which is now going by the eastern route." Since the Illinois River is a navigable river the deepening of it would necessarily be under the control of the National Government. The United States Government has done nothing more with the Desplaines River than to make surveys. (580, 581.)

Mr. Carter states that the Illinois and Michigan Canal is still operated by the State of Illinois. (581.)

XIV. OCEAN TRANSPORTATION.

A. Different methods of shipment in different ports.—Mr. NEALL, a shipping merchant of Philadelphia, testifies that at different Atlantic ports the methods of shipment of ocean freights differ materially. New York, being the most important port, is reached by a large number of regular steamship lines running to many different ports, and it is not necessary to arrange for means of transportation in advance to any such degree as in the other cities. At Boston, also, there are few tramp steamers, but many regular sailings of freight vessels to Liverpool and some to other ports. The freight room on these vessels is largely engaged in advance through the agents of railways. The bulk of the grain transported from Philadelphia, Baltimore, Norfolk, and Newport News is taken by tramp steamers, and these are largely chartered in advance for full cargoes. These tramp steamers will carry freight to ports practically never reached by regular lines, although their rates to ports reached by regular lines would be higher. (161-163.)

B. Rates. (See also as to *Flour shipments*, p. 77).—Mr. NEALL testifies that in the case of flour shipments, through rates from the inland points to Liverpool or other foreign ports are usually made. The steamship lines offer ship room to the railways from time to time, for a particular vessel or period, at a certain rate, and the railways make through rates accordingly, apparently sometimes varying their own rates slightly to fill the room offered. It was formerly the practice to ship flour in large quantities to Eastern ports without such arrangements for through shipment, and the same is still true, mainly, regarding grain.

There is no agreement among the freight carriers of the North Atlantic as to rates, and the rates vary greatly, according to the supply and demand. There is, in fact, competition for vessels from the traffic of the entire world. Tramp steamers, owned in England, may be sought for transportation from American ports, and at the same time they may have offers to carry cargoes to or from ports throughout the world. The regular lines also vary their rates frequently, according to the supply of tramp steamers, the amount of freight seeking transportation, etc. Rates may be changed sometimes twice in one day.

Ocean freight rates, unlike rail rates, depend more upon the space occupied than upon the weight. Railway cars are seldom filled to their full bulk capacity, since the weight of most products is too great. The ocean carrier can scarcely be overloaded as to weight. Indeed, concentrated weight is desirable. The differences in ocean freight rates between different products depend to a considerable degree upon the cost of handling the product in loading and unloading, and

168 THE INDUSTRIAL COMMISSION:—TRANSPORTATION.

upon the amount of waste space caused by the shipment. Thus grain can be more cheaply handled than flour, and occupies about one-sixth less space per ton. (163-165.)

C. American merchant marine and its encouragement. 1. *Time charters.*—Mr. NEALL testifies that during the last year or two it has become increasingly common for Americans to secure charters of foreign vessels for considerable periods, running from 6 months to 2 years. The owner furnishes the officers, crew, and engine stores, but has no further control of the vessel. The lessee furnishes coal, and is able to use the vessel between whatever ports he sees fit. The great advantage of this practice is that it prevents delay in shipments and enables vessels to visit ports which are not commonly reached. (168, 189.)

2. *Small tonnage of American merchant marine.*—Mr. NEALL, a shipping merchant of Philadelphia, believes that the entire tonnage of American vessels fitted for transoceanic traffic does not exceed 300,000 tons gross register. He estimates that the total gross tonnage of the steam and sailing vessels of the world is about 28,000,000 tons.

| | Tons. |
|--|------------------|
| Total steam tonnage (gross), in vessels of 100 tons or over, of the world..... | 20,800,000 |
| Total sail tonnage (net), in vessels of 100 tons or over, of the world..... | 6,800,000 |
| | <hr/> 27,600,000 |
| Of above Great Britain owns, say, one-half..... | 13,900,000 |
| Of above United States owns, say, one-eleventh..... | 2,400,000 |
| Of above Germany owns..... | 2,400,000 |
| And Norway is next with..... | 1,700,000 |

The exports of the United States amount to about 30,000,000 tons of freight and the imports to about 7,500,000 tons. Although the United States is credited with the ownership of vessels having a register of 2,400,000 tons, Mr. Neall, by taking the character of each individual vessel into consideration, estimates that only 296,185 tons are represented by vessels suitable for transoceanic traffic, as shown in the following table:

| | Tons. |
|---|---------------|
| 140 steamships, with aggregate gross register of..... | 300,425 |
| 52 ships, with aggregate gross register of..... | 111,433 |
| 14 bark, with aggregate gross register of..... | 18,870 |
| 88 schooners, with aggregate gross register of..... | 115,101 |
| 294 Total gross register..... | <hr/> 644,829 |
| From this total should be deducted, as not intended, and in reality unsuitable, for the transoceanic trade, having been constructed especially for the requirements of coastwise or near-by commerce..... | |
| 169 vessels of gross register..... | 348,644 |

Leaving as suitable and available for transoceanic traffic 125 vessels of gross register 296,185

| | |
|--|---------|
| Of which are steam, 47 vessels, gross register..... | 149,040 |
| And of these latter 23 steamers with gross register..... | 73,420 |

were built abroad, and subsequently, under various conditions, granted United States register.

In making this estimate Mr. Neall has excluded all vessels of less than 1,000 tons burden, because they can not possibly compete in the transoceanic trade. Sailing vessels more than 20 years old have been excluded as unsafe. Although we have a considerable tonnage in coastwise steamships, these have not coal capacity sufficient for crossing the ocean, and their construction, especially the high superstructure, makes them also unfit for North Atlantic navigation. Mr. Neall submitted a list of all the American vessels of more than 1,000 tons gross register sailing from ocean ports, together with an enumeration of the reasons in each case for excluding such as are deemed unfit for ocean traffic.

Mr. Neall says further that there is no trans-Atlantic steamship line composed wholly of American-built vessels, part of those of the American Line being of foreign construction. Not over three trans-Pacific lines are composed of American vessels. (166-168, 175-184.)

3. *Reasons for small tonnage.*—Mr. Neall does not enter into detail as to the reasons for the comparatively small proportion of American shipping, further than to point out that the cost of constructing steam vessels, especially the lower grades, tramp steamers, etc., is much higher in this country than in England. Previous to 1860, when ocean transportation was confined practically to wooden vessels, the United States excelled all other countries in its proportion of shipping and in its success in the business. This superiority is attributed by Mr. Neall less to the discriminating duties than to the ability of Americans to construct better and faster ships and to man and navigate them more ably. While our shipyards have built some fast ocean-going liners and numerous war vessels,

they have practically never built an ordinary ocean tramp, which is the kind of vessel that handles the great bulk of commodities.

Although the difference in the cost of construction of such vessels between this country and Europe is less than formerly, Mr. Neall believes that a substantial tramp steamer of 7,000 tons dead-weight capacity can be built in Great Britain at a cost of \$42.50 or \$45 per ton, while it would be impossible, even aside from the present high price of iron, to buy them here at less than \$65 or \$70 per ton. On higher-class vessels, where there is more joiner work and other fine work, the difference between Europe and America is less. Mr. Neall does not explain fully the reasons for this higher cost in the United States. It can not be due to the higher cost of steel and iron or of wood, nor does he believe that American labor is, in view of its higher efficiency, necessarily dearer. But our shipyards are comparatively few, and those which we have are taxed to their fullest capacity to build high-grade vessels, and could not, if they would, build any considerable number of ordinary steam vessels within a reasonable length of time. For these reasons Mr. Neall thinks it would not be unjust to American shipbuilders to permit Americans to buy vessels abroad for navigation under the home flag, in view of the immediate and pressing need for an American merchant marine. (169-172.)

4. *Purchase of vessels abroad.*—Mr. NEALL accordingly recommends that, aside from any other measures in the shape of subsidies or postal payments designed to build up an American merchant marine, laws should be passed permitting American citizens to buy foreign vessels and put them under the United States flag. He would prohibit craft thus purchased from being used in American coastwise trade or in trade with any foreign port within 500 miles of the shores of the United States proper; and would provide that these vessels should have a dead weight capacity of not less than 5,000 tons for steamers or 2,500 tons for sailing vessels, and that they should not be over 5 years old at the time of purchase. If further restrictions seemed necessary it might be enacted that the number of ships thus bought should not exceed 500,000 tons net register, and that a duty of \$1 per ton for 5 years should be levied upon them.

Mr. Neall states that the Norwegians have made an extensive practice of buying foreign-built vessels and putting them under the home flag, and that they have made large profits by doing so. At present a large proportion of the vessels thus bought by the Norwegians have been leased by them to Americans on time charters, running for 6 months to 2 years, at high rates.

Were an American merchant marine thus established, Mr. Neall believes that the vessels could be run with sufficient economy to compete in the world traffic. It is true that the wages of American sailors are higher than those of foreign sailors, although the difference is less than formerly, the average pay of an English seaman having been raised to about £1 10s. The food furnished on American vessels is also of better quality, and in other ways the cost of navigation is somewhat higher. But the witness is confident that this difference is not sufficient to necessitate higher rates of freight on American vessels than on those owned abroad, nor to preclude the earning of a fair profit, especially as our vessel owners learn the economies which are employed in other countries. (169-171, 177.)

5. *Discriminating duties.*—Mr. NEALL does not believe that the system of discriminating duties would be an effective one in building up an American merchant marine; nor does he attribute the earlier development of American shipping to the duties which then existed. Unless the discriminating duty be excessively high the foreign vessel owner would bid for traffic with a view to the duty and would still underbid the American owner. (172, 173.)

6. *Coastwise trade.*—Mr. NEALL testifies that under the existing laws only American-built vessels can be employed in American coastwise trade. The men employed in that business, however, have been very enterprising, and have kept the demand for transportation fairly supplied. (172, 174.)

7. *Shipping bounties and labor.*—Mr. FURUSETH, secretary of the Sailors' Union of the Pacific, does not think that the payment of bounties to American vessels would have any effect upon the condition of the men. As a general thing he has never seen any master of a vessel paying more than he had to pay or giving better food than he had to give. He has some question whether the proposal to subsidize the fishermen, in the form in which it is made, does not make the seamen subject to impressment. That is the chief reason why the convention of seamen in Chicago condemned that bill. The following paragraphs make clear Mr. Furuseth's opinion on the subject of bounties. (690-700.)

"None of the schemes that I have seen so far, or heard discussed so far, has anything in it that would in any way increase the number of real American sailors, or cause any American boy to go to sea, or stay at sea, or in any way make it any easier for the merchant marine or Navy to obtain real American sailors.

"Q. You would think, however, that some of these measures might be taken to increase the business of the American merchant marine?—A. Yes; probably.

"Q. Well, then, if these measures were accompanied by such measures as you suggest for the improvement of the condition of the sailors, you think it would be of general benefit to the country?—A. Then the improvement, so far as the sailor is concerned, would come from the measures accompanying the measure, and not from the original measure."

"Q. Do you think the bounties proposed in these subsidies, in these bills, to the fishing fleet are going to be of any advantage in bringing more into that, and then ultimately augmenting the marine?—A. No; not a bit of it.

"Q. You think it will be simply absorbed where it is?—A. The seamen, instead of getting \$20 a month, will get \$19 a month from the man who hires him and \$1 from the Government. It is simply another way of subsidizing the vessel, that is all—adding so much to the subsidy paid to the owner of the vessel—and will not do the sailor one iota of good."

D. Condition of American ocean seamen.—1. *United States law relating to seamen.*—Mr. FURUSETH, secretary of the Sailors' Union of the Pacific, states that the law relating to seamen passed by the Fifty-fifth Congress has been of great benefit on the whole, though there were certain mistakes in it, particularly the repeal of some of the old law which had worked well. On the whole, foreign laws regarding seamen are not better than those of the United States, though they are better in some particulars.

The Seamen's Union, however, has drafted a bill to amend the laws relating to American seamen. Its proposals are to abolish crimping, so far as it can be abolished by law; to increase the space in the forecabin; to give the seamen a right to one-half of what is actually due him in every port; to give the majority of the crew, exclusive of officers, the right to call for a survey of the vessel; to establish a standard of skill and experience for those who sign as able seamen, and to provide a standard number of men to be carried by vessels according to their tonnage and rigging. (691-693.)

Mr. Furuseth supposes that the reforms which the Seamen's Union desires will probably make the running of vessels a little more expensive. The cost of running a vessel includes so many things that the wages of the men are only a small part of it. The cost of running does not by itself determine the possibility of competition. It is said that when the American merchant marine was practically supreme, 50 years ago, American vessels could get a higher rate than those of other nations, because of the better stowing and better care of cargoes, and the faster time they made. No doubt increased wages and improved condition and treatment of the men would result in getting a better class of men and better service, which would tend to make up for the higher wages. (699.)

The witness takes up the conditions of seamen and the proposed reforms in detail.

2. *Hiring of sailors—Crimps.*—Mr. FURUSETH says that when a master needs a crew he commonly goes to a shipping master or "crimp" and makes a contract with him to furnish a crew. The crimp and the master agree upon the wages to be paid. The crimp secures a crew from men who come to his office or by dealing with the keepers of sailors' boarding houses, and is usually paid for his services by the sailor with an "allotment" or order on the ship.

The law formerly allowed a sailor to make an "allotment" for not more than \$10 a month, but the last Congress changed it to not more than one month's wages. The allotment usually goes, not to a bona fide creditor, but to a crimp, to be divided between him and the ship captain and perhaps the keeper of a sailor's boarding house. The Seamen's Union does not desire that the possibility of making an allotment to a man's family or relatives be removed—to remove it would be a great hardship; but the allotment to creditors is a means of robbing the sailor. Indeed, the law forbidding more than one month's allotment to creditors is constantly violated, and it is very hard to get evidence of violation because the sailor is immediately carried away out of the jurisdiction. (690-692, 696.)

If this allotment to original creditors were abolished, and a law were made entitling the seaman to one-half what he has actually earned in every port where the vessel loads or delivers cargo, and if the seaman were given the full right to quit wherever he is, the crimp would have to go out of business. Plymouth, Portsmouth, and Sheerness, the three man-of-war ports of England, used to have the worst crimp dens in the United Kingdom; but when the Admiralty decided to pay their men monthly wherever they happened to be, these dens were wiped out. (691.)

3. *Payment of sailors' wages and compulsory service.*—Mr. FURUSETH states that sailors' articles now usually provide for service for 12 months, and no money dur-

ing the interval except at the master's option. Often the master will absolutely refuse to make any payments. That generally means that he intends to misuse the sailor so that he will run away and forfeit his pay. The sailor, poor and under the necessity of getting employment, has no option but to sign the contract. The Seamen's Union is trying to induce Congress to provide that a sailor may quit his employment in any port and receive all the money that he has earned. (695, 696.)

Up to 1898 a seaman was subject to imprisonment for refusing to continue to labor, in the United States as well as out of the United States. If he left his employment he might be imprisoned, kept in jail for an indefinite period at his own expense, then taken on board the vessel against his will, and compelled to proceed to sea and do the work for which he had engaged. If he refused to work he was subject to penal or to corporal punishment and to being placed in irons on short rations. If he deserted, the master might offer a reward for his detection and return to the vessel. Eighty men were thus reclaimed in Callao last year, one in Singapore, and one in Yokohama; one, in Singapore, was punished besides. The present law of the United States in respect to forcing seamen to specific performance of their contracts of service, however, is better than that of most other nations, except England. Since 1898 there has been no penalty for desertion in a home port. The sailor can take his clothes and go, but he forfeits all the money he has earned. The Seamen's Union desires Congress to so change the law that the sailor will be free to quit in any port, and to get his money, too. (686, 691, 695.) The sailor still commonly says after shipping, "I have sold myself." An effort was made to establish the freedom of sailors from compulsory service under the thirteenth amendment to the Constitution, but the Supreme Court held that that did not apply to seamen. Efforts have been made to get Congress to abolish the law under which a sailor can be seized and returned by force to his vessel, but so far without success. The witness states that if sailors were free to quit at will vessels would be under no difficulty in getting new crews. The usual thing is to pay the sailors or drive them out when a vessel comes into port for some time, and let the vessel lie without sailors until she is ready for sea again, and then hire new ones. (707.)

4. *Dependent seamen.*—Mr. FURUSETH says that Congress appropriates annually a certain amount of money for the return of sick and disabled seamen to the United States. It would be much better if the return to the United States were abolished and the sailor were left free to quit. As to the statement that many sailors who have left their vessels become dependent, and have to be sustained and sent home at the expense of the Government, the witness says that the most of such men were probably driven out of the vessels they were in, without receiving any pay for the work they had done. A vessel lying in a port waiting for cargo does not wish to keep the men on board. By the law of 1884 the master may discharge the men, if they consent to be discharged, by paying them what is due them. If a man is offered his discharge and his pay and refuses to take it, he will invariably be treated so that he will leave in a week or two without his pay. Sometimes masters will refuse to give a discharge when it is asked for, and then will so abuse the man that he will run away and leave his pay behind him.

5. *Wages and economic condition of seamen.*—Mr. FURUSETH states further that the absence of any standard of qualification for seamen results in the fixing of wages at such a point as the idle men in a seaport, without regard to knowledge of the sea, can be induced to accept. Wages of seamen are determined entirely by the port, and not by the flag. Seamen's wages in New York City are the same to the American, Dutch, German, English, or Norwegian ship. There is no such thing as American wages; it is international wages. Seamen's wages vary much. They will run from \$15 in the port of New York up to \$30 in different American ports. In Sunderland, England, they are fully as high as in New York. In Liverpool they are usually lower. They are lower still in Antwerp and in Mediterranean ports. In San Francisco and on Puget Sound deep-water wages are about \$20; in New York, at the present time, about \$18. English sailors get between £1 and £6 a month.

These are all white men's wages. Asiatics ship in Hongkong and Yokohama, and their wages are \$16 Mexican. About one-quarter of our merchant marine is manned by Asiatic seamen. All these statements refer to the foreign trade or deep-water wages. The wages in our coastwise trade are higher than in the foreign trade, and higher than in any other coastwise trade except that of Australia. Coastwise wages at New York are at present from \$18 to \$25. In San Francisco they run from \$30 to \$40, and in a few cases to \$45. In fact, the general condition of sailors in the coastwise trade is better than in the deep-sea trade. The witness ascribes this partly to the fact that from 1874 up to 1890 the men in the coastwise

trade were free to quit. Being free to quit, they were free to organize. Besides, the work is harder, and a better class of men is needed. (687-689, 697, 698.)

While the wages of men working ashore have increased, the wages of seamen have been stationary. The cost of living has increased in about the same ratio as shore wages; and the result is that the seaman's wages are not sufficient to keep himself, far less a family. The condition is the same in other countries as in the United States. Norway used to furnish a great number of seamen. The Norwegian sailors were better off than the ordinary mechanics on shore. But now the condition of shore employment has so improved that the standard of living of the shore mechanic has risen vastly above that of the seaman. Norwegian vessels are now very largely filled with Swedes and Finns. The case is the same in England. A man can earn more on shore than at sea, and can be at home with his family. Though a boy may go to sea from notions of romance, he will leave it when he has made one or two trips, and finds out what the life is, what the work is, and what wages he is likely to get. The first thing a sailor does when he comes into New York is not, as the shore people think, to go and get drunk; he looks around and tries to find other employment. He becomes a bridge builder, or an architectural ironworker, or a gripman on the street cars, positions where his training in climbing and in quick thinking and quick work are of value. Seventy-five per cent of the men who work at architectural ironwork in Philadelphia, Boston, and Chicago are sailors. Aside from the actual economic debasement of the sailor's condition, there is a loss of social caste which results from this economic debasement. The ordinary man ashore speaks of the sailor as a poor fellow, who would not go to sea if he could do anything else. The remedy for this state of things is to improve the general condition of the men so that it shall be equal with that of other ordinary mechanics. (697, 698.)

6. *Permanency of employment.*—Mr. FURUSETH states that in the Continental and English marine men usually ship for a year, and stay in the same vessel about a year or two. He does not speak of the regular liners, as he never sailed in them. It appears from a British consular report, quoted by the witness, that on the well-known and wealthy English lines the same picked men continue to be employed from voyage to voyage and year to year. (694, 695, 703.)

7. *Nationality of seamen.*—Mr. FURUSETH states that about one-fourth of the American merchant marine is manned by Asiatic seamen, Japanese, Chinese, Lascars or East India sailors, and Tagals or "Manila men," together with Turks and Arabs. Even in the coastwise trade, although the vessels must be American, there is no such requirement as to seamen, and on the Pacific coast not more than 10 per cent are American born. On that coast, the Scandinavians, including with them the Finns, probably predominate; next would be the Germans, and Americans last of all. The conditions are not very different in the Atlantic coastwise trade.

It is a very rare thing to have an Asiatic on a German, Scandinavian, or French vessel. On English vessels they are to-day as common as on American. No other nation uses them to any extent.

Some of the foreigners referred to above are naturalized citizens, and some others have declared their intention to become citizens. Prior to 1893 about one-half of the coasting seamen on the Pacific coast belonged to these classes. The witness does not know what the proportion is now. (689, 690.)

The vessels that trade between Hongkong and San Francisco and Puget Sound, whether under the American or English or Japanese flag, sign all their men in China or Japan. They carry white quartermasters and white officers, but no white men as sailors, as firemen, or in the steward's department. Although the wages of the Asiatics are only about \$16 Mexican, they can not be much cheaper than white men, because about twice as many Chinamen as white men are needed to do the same work. They are said to be more docile, and not so apt to get drunk or leave the vessel. Where real seamen are needed in a storm or disaster they are practically useless, for they have not the coolness, courage, or strength of the average white man. (708.)

Seamen are exempt both in the immigration laws and in the Chinese exclusion laws; so that neither of these laws gives any protection to the American sailor. (709.)

Mr. NEALL says that the law provides that only Americans may hold official positions upon vessels engaged in the coastwise trade. There is no such limitation as regards common sailors, however, and the witness estimates that 50 per cent of the sailors on these ships are of foreign birth, especially Germans, Danes, and Scandinavians. It is not true that on the Pacific Ocean the vessels engaged

in the coasting trade are largely manned by Chinese and Japanese, the existing laws relating to the Chinese practically preventing their employment in this way. (172, 174, 175.)

8. *Undermanning of vessels.*—Mr. FURUSETH quotes with approval a British Parliamentary report dealing with the impossibility of a contract on equal terms between employer and employee in respect to sea service. Many considerations, such as rigging, sail area, steering gear, winches, number of fires, coal consumption, position of bunkers, etc., must be taken into account in determining the proper crew for a ship. The seaman can have no adequate knowledge of such considerations nor of the extent of the work to which he binds himself. If the crew of an undermanned ship refuse to serve, they are liable to imprisonment. If they do serve and by working for their lives succeed in reaching their destination, they will have established their number as a proper crew for the vessel until a further reduction is made. (702.) The only country that has a definite law about the manning of vessels, says Mr. Furuseth, is New Zealand. Labor-saving machinery has somewhat reduced the number of men needed to work a vessel, but the number of men carried has been decreased disproportionately to the need. There are vessels on the Pacific coast which while sailing in the foreign trade carried 18 and 20 men, but now carry 10. The witness mentions 1 ship which used to carry 36 men and now carries 14. He estimates that she should have 24. In 9 vessels out of 10, if the ship is taken aback, the only thing to do is to depend on the strength of the gear. The yards can not be swung quickly enough to prevent damage, for lack of men. American vessels carry less men than those of Europe. Holland carries most, Denmark next, Sweden next, then Norway and Germany, then England, and last the United States. The number of men carried varies somewhat with the wages. If wages go up a vessel usually takes 1 or 2 men less. (687, 688.)

Mr. Furuseth states that most sailing vessels now have a steam donkey winch, which is used in going in and out of port for lifting anchor and hoisting sails; but at sea steam is not kept up in it. The principal labor-saving devices aside from this are double topsail yards, double gallant yards, patent blocks with small inside rollers, and the use of softer, better rope—manila rope. (687-688.)

9. *Food and drink of seamen.*—The food of seamen, Mr. FURUSETH states, is regulated by law. Up to 1898 the requirement was fully 50 per cent poorer than the food provided for the prisoners in Sing Sing. It was exactly equal to the English contract scale, about 50 per cent below the German scale, and about 100 per cent below the Danish scale. The existing American scale is better. Mr. Furuseth gives in detail these comparative scales. He says that the only complaint which he would make of the American scale is that the water should be increased from 4 quarts a day to 6 quarts, and the butter from 1 ounce to 2. In fact, however, the scale is not in general operation. It is not given in the deep-water vessels, and even not in some of the coastwise vessels. (686, 693, 694.)

Mr. Furuseth quotes at length, although without special reference to this point, an English consular report in which the enforcement of total abstinence from liquor on British sailing vessels is declared to result in increased excesses on arrival in port. It is stated that a daily ration of spirits works well in the English navy, and that, since the proportion of total abstainers in the navy is incomparably higher than in the merchant service, it can not be considered fatal to the cause of temperance. (704.)

10. *Air space for seamen.*—The air space in the forecabin, where the seamen live, is regulated by law. The requirement for steamers is that each man have 72 cubic feet of air space, and not less than 12 feet of floor space; that is, a space 6 feet long, 6 feet high, and 2 feet wide. By a change made 3 years ago, the requirement for sailing vessels thereafter built or rebuilt was changed to 100 cubic feet. Seventy-two cubic feet is the requirement in England and Germany; but inasmuch as German and English ships do not carry loads on the decks, where the houses usually are, they have no special temptation to narrow the space for the men. In England the space actually given is usually about 100 to 120 feet. (686.)

11. *Watches on shipboard.*—Mr. FURUSETH explains in detail the division of the 24 hours into 7 watches. He states that in some vessels it is the custom to keep all the men on deck during the daytime; that is, to have both watches on deck during the period from 12 to 4 in the afternoon. This gives too little sleep and rest, and makes the men too much subject to sleepiness to be effective at the wheel or on the outlook during the night.

Another custom has recently grown up which is called the Kalashi watch; that is, all hands on deck all day and called out whenever they are wanted during the

might; but on deck steadily through the night only a watchman, a lookout man, the wheelman, and the officers on the bridge. If a disaster happens at night to vessels so managed, the men come from the fore-castle half asleep, the light half blinds them, and for the first 15 minutes they are practically useless. Besides, it is, of course, much harder for the men to work all day and be called out at night also.

This practice enables vessels to run with 2 or 3 men less than they would otherwise have to have. It is used on practically all of the passenger steamers on the eastern coast of the United States. It is not so much used on the Pacific coast and has not been applied in Europe.

No man is capable of proper lookout or proper work at the wheel for more than 2 hours at a time. In a storm or on very serious occasions 1 hour is long enough, and sometimes too long. In the Great Lakes, on freight steamers, at least, men stand at the wheel for 4 hours, sometimes as much as 6 hours. (700-701.)

12. *Examination of ships by sailors.*—Mr. Furuseth says that it is impossible for sailors to control their own actions with regard to the kind of ship, seaworthy or not, which they shall sail in. They do not always ship in the port in which they join the vessel. Men may ship in Boston and Philadelphia for a vessel in New York, with no opportunity to inspect her. (701.)

13. *Loss of life on passenger vessels.*—The witness attributes the great loss of life in certain disasters to passenger vessels to the insufficiency of life-saving apparatus and the insufficient number of the crew. He implies that the fact that the Cunard Line has never lost any passengers is due to the carrying of a larger number of skilled men than other lines carry. According to the witness, accidents between 3 and 6 in the morning, particularly about 4, are most likely to result disastrously. Sailors call this period "the graveyard watch." About 4 in the morning one watch leaves the deck, and another, which has had but 4 hours' sleep that night, comes up. (700.)

14. *Denial of shore leave.*—Mr. Furuseth quotes, as expressing the condition and feeling of seamen generally, an English consular report on the condition of seamen in the British merchant marine, in which very serious complaint is made of the denial of shore leave while in port. In the British navy shore leave is granted freely when opportunity offers, and the same custom prevails in the steam merchant marine. In sailing vessels, however, men are kept for weeks together in harbor without being permitted to step off the ship. The report regards this grievance as by far the chief incentive to desertion and to the minor offense of absence without leave. (701, 705.)

15. *Corporal punishment of seamen.*—Mr. Furuseth states that the United States law forbidding corporal punishment of seamen is constantly violated. The most common form of punishment is a blow over the head with a belaying pin—a stick like a policeman's club. Such blows are given by officers in sudden passion and without any control from superior officers. In continental and English vessels such occurrences are very rare. (692.)

16. *Qualifications of seamen.*—Mr. Furuseth says that an "able seaman" is a healthy man in his active years, accustomed to the sea, who has received the peculiar training that makes it possible for him to apply his wits to conditions as they come. The Seamen's Union desires a law providing that an able seaman must be more than 18 years of age, and must have had 3 years' experience at sea. (708, 709). The law at present does not set any standard of qualification. Anybody whom the captain considers a seaman is a seaman, whether he has ever been at sea or not. Custom used to determine the qualification. Four years' apprenticeship is still customary in England. In most countries apprenticeship has been abolished. In German and Scandinavian countries the standards are stricter; a boy goes to sea as a boy; about the second year he will be called a young man; the third year and the fourth year an ordinary seaman; after about 4 years he will rank as an able seaman. The American Navy has a very exacting standard of skill—the old standard of years ago. Not more than 15 per cent of the men engaged as seamen on the Great Lakes would pass the naval standard as able seamen. The vast majority would not pass as ordinary seamen. About one-half of the men on the Atlantic and the Pacific coasts might pass as able seamen, one-quarter as ordinary seamen, and one-quarter would be called handsmen. Even as to officers, including the master, our law has not until recently prescribed any qualification, except that they should be citizens. (687.)

17. *Labor unions of seamen.*—Mr. Furuseth, secretary of the Sailors' Union of the Pacific, says that there have been organizations of the seamen on the Lakes, with short intermissions, since 1863, on the Pacific coast since 1885, and on the Atlantic coast since 1890. In 1892 the local unions were organized into an international union, and were affiliated with the American Federation of Labor. The membership is nearly 5,000. The general objects are to improve the condition of the seamen,

industrially and socially, and to improve the maritime law. There is a funeral benefit for the burial of dead members, and in case of shipwreck and loss of clothing the organization pays a sum not exceeding \$50 to buy a new outfit. The three local organizations, on the Lakes, on the Atlantic, and on the Pacific, deal with matters of wages each for itself. There is a national card transferable from one local union to another, and men engaged in the lake trade can pass to either of the ocean organizations, and vice versa. There is no traveling benefit. There are no rules as to apprenticeship. The national body has had four conventions. The convention formulates a legislative programme, and gives instructions to the legislative committees; but there is full cooperation between the legislative committees and the executive committees. (685-686.)

Mr. FURNETH says that the wage question would settle itself with sailors if they were given the opportunity to help themselves—the opportunity to organize. The sailor can not effectively organize because he can not quit his employment; he can not strike. (698.)

18. *Homes for aged and disabled sailors.*—Mr. FURNETH says that the Sailors' Union looks on homes for sailors as eleemosynary institutions, which are in one way a good thing, but tend in the wrong direction, in that they perpetuate the treatment of sailors as children. He doubts whether it would be a proper thing for the United States to establish such homes. In case of disability, there are marine hospitals, supported by the United States Government, and including a farm in Arizona or New Mexico, where consumptives are sent. The witness entirely approves of these hospitals. Sailors used to contribute 40 cents a month to them before the passage of the law of 1881, but now they are supported out of the tonnage dues on vessels. The Sailors' Snug Harbor in New York is the outcome of private benevolence. The institution has become very rich. (696, 697.)

XV. MISCELLANEOUS EVIDENCE NOT RELATING TO TRANSPORTATION.

A. *Trusts and combinations.*—Mr. MOSELEY, secretary of the Interstate Commerce Commission, thinks that discrimination in railway rates has been one of the main advantages accruing to large combinations. Trusts tend to lessen the number of employers and of employees. The workman is in danger of losing his individuality and becoming a mere dependent part of the machinery of the establishment. He will be unable to find other employers if he refuses to work for the combination which controls the entire business. (43.)

Mr. SAGER, secretary of the Northern Milling Company of Chicago, thinks that industrial combinations are not necessarily bad; that they can effect great economies, and are the natural economic result of existing conditions; but he does not believe in monopolies and regrets to see the small individual proprietors driven out of business. (454.)

Mr. COUNSELMAN, an elevator owner of Chicago, declares himself in favor of large aggregations of capital, but not of combinations possessing power to control prices absolutely. He had some experience in dealing with the American Tin Plate Company, and thinks its prices are probably reasonable in view of the high cost of raw materials. (390, 391.)

Mr. CARTER, a grain dealer of Chicago, does not think that the trust, in and of itself, if founded on actual values, need frighten anybody. He believes that the two greatest questions before the people are, first, the prevention of preferences in freight rates; second, the prevention of overcapitalization. He considers that absolute equality of opportunity is all that any man is entitled to. He does not believe that large concerns, dependent altogether on hired assistants, can overcome, in legitimate competition, the smaller man who maintains a direct supervision of his business. (583-585.)

Mr. DICKINSON has heard it charged very strongly that the railroads have obtained a monopoly of coal mining in the East, but he does not think that such a monopoly exists generally throughout the country. There is a large mining district in Illinois, and he has not heard it charged that the industry is there monopolized by the railroads. (553.)

United States Flour Mill Company.—Mr. BARRY testifies that this company has been recently organized with a capital, he believes, of \$15,000,000. It includes 24 large mills in several Northwestern cities. The capacity of these mills is not over 50,000 barrels per day, no attempt being made to control the output or prices. The object of the combination was, by having a large capacity in different advantageous localities, to make the business more independent of local conditions and to reduce the cost of management and of selling. The good will of the

plants entering the combination was a very considerable element in the price paid for them. (242.)

B. Agriculture.—Mr. NEWCOMB, of the Department of Agriculture, says that the difficulties under which farmers labor are due partly to the fact that our public-land systems and railroad grants induce producers to settle beyond the range of profitable production, and partly to the lack of organization and of knowledge as to methods and conditions of the industry. This lack of knowledge the Department of Agriculture is seeking to remedy by its reports and statistical information. Its monthly estimates of crop conditions and probable production are secured through about 60,000 correspondents, who exercise great care and intelligence. The witness considers them far more accurate than any estimates of dealers. These reports are useful to dealers and speculators, but do not therefore injure farmers. By greater knowledge of conditions, speculators tend to fix prices more evenly and accurately, so that there is less difference between prices at harvest and through the year. (106, 107.)

Mr. Newcomb declares that speculators perform a useful function in distributing agricultural products. By their familiarity with conditions of production and consumption they are able to estimate the probable future prices, and thus to make prices throughout the year more uniform than they would otherwise be. The price at harvest is thus kept up more nearly to the level of the price later on. Speculation in farm products may, in abnormal cases, be detrimental, but not usually. The price of farm products is ultimately fixed by the cost of production to the man whose production is the most expensive, but whose product is necessary to supply the demand. This ultimate price is largely fixed in the Liverpool market. The practice of selling options can not long mislead dealers as to the true grain supply. (107, 109.)

Duties on grain and grain products.—Mr. EVANS, a miller, of Indianapolis, points out that most European countries and some other countries, such as Brazil, have established discriminating duties against American flour as compared with wheat, thus seeking to develop their own milling industry. The witness thinks that by treaties or otherwise the United States should seek to prevent such discriminations. A department of commerce might be beneficial in accomplishing such results. (439.)

Adulteration of flour.—Mr. BARRY, secretary of the Millers' National Association, says that flour has in recent years been very largely adulterated with a by-product of glucose or starch, or even with white earth, to the great detriment of the flour product. The mixed-flour law, passed by the Fifty-fifth Congress, has entirely stopped this practice. (240.)

C. The cattle business.—Mr. BAKER, secretary of the Chicago Live Stock Exchange, says that there seem to have been about 52,000,000 cattle in the country 6 years ago, and there seem to be about 10,000,000 less to-day. It would take perhaps 3 or 4 years, with a continuance of high prices, to make up this deficiency. An animal can be bred and put on the market in 18 months or 2 years, but since it is necessary to supply the current demand as well as to make up the shortage, it will take a longer time than that to catch up. At the same time the consumption is heavier than it has been. (592.)

Mr. MALLORY states that men in the live stock trade do not figure, as the Agricultural Department does, on the whole number of cattle supposed to be in the United States. So far as trade and values are concerned, it is the supply and demand in the market that governs, and not what exists in the country. Mr. Mallory does not consider the live stock statistics of the Agricultural Department to be of any value whatever. There are no statistics of live stock in this country which he considers reliable. (589-591.)

Mr. Mallory says that the price of cattle has been considerably higher since 1890, perhaps \$1 to \$1.50 per hundred, than during the preceding 3 or 4 years. Hogs have not risen so much; perhaps 25 cents to 50 cents per hundred. Fat cattle had gone down just before Mr. Mallory's testimony, November 24, 1899. Stock cattle had declined a little. The decline in hogs came in October, as it generally does in the fall. Mr. Mallory attributes the rise of live stock in 1899 not so much to the shortage of supply as to the increase of demand. The laboring man uses a larger percentage of his earnings for meat in prosperous times, and during this year he has been well employed at fair wages. Mr. Mallory thinks the consumption of meat is from 35 to 40 per cent greater than it was 3 years ago. He admits that there has been a relative shortage, and that this has of course helped to raise the price.

The witness thinks that the so-called shortage of live stock in 1890 was the result of the depression of 2 or 3 years before. At that time the prices were very

low and a great many people became discouraged and threw their cattle on the market. This process was also increased by the eating out and fencing up of the Western ranges; but if the owners had not been discouraged by low prices, they would have found places to feed and mature many of the cattle which they did throw prematurely on the market. (589-592.)

Mr. Mallory says that when beef reaches a certain price consumption will decrease, and if pork is relatively lower many consumers will take up with pork; if mutton is lower the demand for mutton will increase; the people are not dependent upon any one class of meat. (591.)

Mr. Mallory states that one part of the Spanish war advanced the prices of meat and another part decreased them. The amount of meat spoiled and thrown away was not large enough to affect the market at all. The feeling which arose from the condemnation of the meat, and the newspaper discussion of it, had an unfavorable effect upon the market, which lasted several months. (590.)

Mr. Mallory states that changes of the price of live stock affect all the markets at about the same time. "The telegraph works very promptly. If Chicago declines other markets decline, and if they decline it has a sympathetic effect upon Chicago." (589, 590.)

D. Immigration.—Mr. CLARK, chief of the Railway Conductors, declares that there is practical unanimity among the railroad brotherhoods in favor of very close restriction of immigration. They do not feel its effects directly, but since the lower classes of American labor are displaced by foreigners, who are willing to live in a manner which Americans will not endure, these classes seek employment in the higher grades of labor, which are thus indirectly affected. The witness would favor increasing the period of residence before naturalization, perhaps to as much as 21 years. (113, 114.)

Mr. ARTHUR says that the Brotherhood of Locomotive Engineers is in favor of restricting immigration, which indirectly affects their prosperity by creating a large surplus of labor. The witness would advocate an educational test and also the requirement of property of at least \$500 for admission into this country. He would also limit the ballot in all cases to those who are able to read and write English. (124, 125.)

E. Department of commerce.—Mr. KENNARD, of the Chicago Butter and Egg Board, thinks that the interests of agriculture and of business have been greatly promoted by the work of the United States Department of Agriculture, and believes that a similar department of commerce would prove of great advantage. (366.)

F. The Mississippi River lumber industry.—Mr. DICKINSON states that the logs avail able for mills along the Mississippi River are disappearing, and a good many of the mills are gone, and others will have to go. This is true all the way up and down the Mississippi River. The witness thinks the lumbermen have felt pretty well satisfied with the way they have been treated by the railroads. (550.)

TESTIMONY.

INDUSTRIAL COMMISSION

TRANSPORTATION.

TOPICAL PLAN OF INQUIRY OF SUBCOMMISSION ON TRANSPORTATION.

PART I.—TRANSPORTATION BY LAND IN ITS RELATION TO LABOR EMPLOYED THEREIN.

CHARACTER OF DUTIES AND CLASSIFICATION OF EMPLOYEES OF RAILROADS AND OTHER CARRIERS BY LAND; THEIR QUALIFICATIONS.

WAGES OF EMPLOYEES.

1. Terms and conditions of employment; rates of wages of different classes of employees; basis and stability thereof; reductions and deductions, and their causes; discharge and suspension and the reasons therefor; blacklisting discharged employees; compulsory performance of service under mandatory injunction; proceedings for contempt, to that end, when railroad is in the hands of a receiver; power of courts in such cases under recent decisions.

HOURS OF LABOR OF EMPLOYEES OF RAILROADS AND OTHER CARRIERS BY LAND.

2. Usual hours of labor exacted of different classes of employees.
3. Sunday labor and overtime; conditions under which required and compensation therefor; limitation thereon by State laws, and effect thereof on employees, carriers, and the public.

LIABILITY OF RAILROADS TO EMPLOYEES FOR INJURIES SUSTAINED BY THE LATTER IN PERFORMANCE OF DUTY.

4. Extent of modification by statute of common-law rule as to negligence of fellow servants; legislation of the States thereon, and effect thereof; statutes authorizing persons dependent on employee to sue for damages when employee has been killed through negligence of railroad.
5. To what extent has doctrine of risks contemplated by voluntarily engaging in a dangerous occupation been modified by statute and judicial decisions? In what States has this been done?
6. Limited liability legislation as applicable to railway employees, its nature and effect.
7. Inadequate or defective appliances.

PROVISION FOR SICK AND DISABLED EMPLOYEES.

8. Aid and benefit features of employees' associations; conditions and extent of relief.
9. Relief and aid to sick and disabled employees, by railroads and other carriers by land; conditions and extent thereof; its effect on relations of employer and employee.

SAFETY APPLIANCES ON RAILROADS.

10. Automatic couplers, air-brakes, and hand-holds, on passenger and freight cars; percentage of freight cars so equipped; cost of such safety appliances on old and new cars; cause of delay by railroads in complying with requirement of act of Congress relating to safety appliances on freight cars.
11. Effect of increased use of automatic couplers, air-brakes, and hand-holds on freight cars on number of casualties to railway employees.
12. Other methods and devices for insuring safety of employees and passengers on railroads.

ASSOCIATIONS AND ORGANIZATIONS OF EMPLOYEES OF RAILWAYS AND OTHER CARRIERS BY LAND.

13. Their nature, purposes, and effect; proportion of employees belonging to them; extent of their control of their members; their effect on employees who are not members of such organizations.

DISPUTES AND DIFFERENCES BETWEEN EMPLOYERS AND EMPLOYEES.

14. Usual subjects thereof.
 15. Strikes, their causes; methods used in conducting them; their effects; their efficacy as a means of settling differences between railway employers and employees.
 16. "Boycotts;" in what do they differ from strikes.
 17. Conciliation, mediation, and arbitration, and other methods of composing differences between railway employers and employees; consideration of State and Federal laws providing for conciliation, mediation, and arbitration.
 18. State and Federal laws designed to repress strikes; judicial construction thereof and decisions thereon; anti-trust law as affecting railway strikes; transportation United States mail; its effects on strikes.
 19. Compulsory arbitration; arguments for and against.
 20. Use of intoxicants by railway employees; to what extent prohibited by employers; effect of such prohibition; observance thereof.
- RAILWAY METHODS IN RESPECT OF RATES, NEW BOND ISSUES, INCREASES OF CAPITAL STOCK AND CONSOLIDATION OF LINES, AS AFFECTING RAILWAY EMPLOYMENT AND RAILWAY WAGES.**
21. Effects of rate wars and unrestrained rate competition upon railway employment and railway wages.
 22. Effect of ticket brokerage upon railway employment and railway wages.
 23. Effect of watering stock and unnecessary additions to bonded indebtedness upon railway employment and railway wages.
 24. Effect of railway consolidations upon railway employment and railway wages.

PART II.—DIVISION A.—TRANSPORTATION BY LAND IN ITS RELATION TO THE PUBLIC.**IN RELATION TO PASSENGER TRAVEL.**

25. Passenger rates; differences in different parts of the United States; causes and effects; local and through rates.
26. The practice of giving passes and reduced rates of fare to individuals; to whom, under what circumstances, and for what consideration are passes and reduced rates so granted by railway companies; effect of the practice on railway receipts; its effect on the traveling public; other effects thereof.
27. State laws prohibiting State officials from accepting or using passes; reasons for such laws; what States have enacted such laws; to what extent are they observed.
28. Advisability of effectually prohibiting the giving of such passes and reduced passenger rates to anyone; of limiting the giving of such special privileges to railway officials and employees.

TICKET BROKERAGE.

29. In what the practice consists; mileage books and excursion tickets; number of people engaged in the business; by whom carried on; effect on passenger travel, interstate and intrastate; to what extent is it supported or encouraged by railroads, and for what purpose.
30. State laws prohibiting it; what States have enacted such laws.
31. Arguments for and against the abolition of ticket brokerage as now conducted.

DIVISION B.—TRANSPORTATION BY LAND IN ITS RELATION TO THE CARRIAGE OF GOODS AND COMMODITIES.**UNJUST DISCRIMINATIONS AND UNDUE PREFERENCES BY RAILROADS.**

32. Against persons; against places; against other railways; manner of making the same; rebates, concessions, commissions; lower relative rates as between places; lower relative rates as between connecting railways; long and short haul; its meaning; when higher rates for short haul justified; when not justified; "Chicago Belt Lines;" their operation, and effect on rates of transportation through Chicago to the Atlantic seaboard and to the West; the "Free Cartage" case; effect of decision of the Supreme Court of the United States in that case.
33. Effect of unjust discriminations and undue preferences on persons, places, and the public; how they affect the producer, the middleman, and the consumer.

UNJUST DISCRIMINATIONS AND UNDUE PREFERENCES BY RAILROADS—Continued.

34. Rates on imports and exports from and to the seaboard; in what do they differ from the rates on domestic products and commodities from and to the seaboard; if they are less, for what reason, and what is the effect of such difference.

UNREASONABLE AND EXCESSIVE RATES.

35. How determined; occasions therefor; what is their effect on places; on the producer, middleman, consumer, and the public; what means is there by which they can be prevented.

REPARATION TO INDIVIDUALS FOR DAMAGE FROM UNJUST DISCRIMINATIONS, UNDUE PREFERENCES AND UNREASONABLE RATES.

36. Is any such remedy available?

THROUGH FREIGHT ROUTES AND THROUGH FREIGHT RATES.

37. Their advantage to the public; how now established; consideration of desirability of having them established by governmental authority, in cases in which railways fail or are unwilling to do so.

38. Equalization of freight rates; necessity therefor; consideration of advisability of governmental establishment of maximum and minimum freight rates.

PUBLICATION OF FREIGHT RATES.

39. Reason therefor; manner in which they are usually published; to what extent is such publication neglected?

40. To what extent are lower rates than those published granted to individuals?

CLASSIFICATION OF FREIGHT.

41. Differences in classification by different railroads; causes thereof.

42. English system of classification.

43. To what extent is the want of uniformity in freight classification a source of unreasonable rates and unjust discrimination?

JOINT TRAFFIC ASSOCIATIONS AND POOLING CONTRACTS.

44. Their object, operation, and effect as now conducted.

45. Consideration of policy of legalizing such contracts, subject to governmental approval, and subject to governmental power to abrogate them on reasonable notice.

CONSIDERATION OF ADVISABILITY OF REQUIRING ALL BOOKS AND ACCOUNTS OF INTERSTATE RAILROADS TO BE OPEN AT ALL TIMES TO INSPECTION BY UNITED STATES EXAMINERS.

CONSIDERATION OF ADVISABILITY OF PROHIBITING BY LAW THE INCREASE OF STOCK BY INTERSTATE RAILWAYS WITHOUT A GOVERNMENTAL PERMIT THEREFOR, AFTER APPLICATION AND HEARING.

46. Average cost per mile of railroads built and equipped in the United States; amount of stock per mile issued by railroads in the United States; amount of bonds; value received for same; total of capital; actual cost of construction; gross earnings; cost of operation; net earnings; interest on bonds; dividends on stock; amount of earnings devoted to construction, equipment, repairs, and betterments; surplus and how disposed of.

47. Railway charters in various States.

48. Taxation of railways by States and the United States.

49. Express companies, sleeping-car companies, fast-freight lines, private cars owned by shippers, bridge companies, depot companies, transfer companies, cartage allowances, and terminal charges.

ISSUANCE BY FEDERAL COURTS OF INJUNCTIONS PENDENTE LITE WHICH SUSPEND THE OPERATION OF STATE OR FEDERAL LAWS REGULATING RAILWAY CHARGES OR RESTRAIN ENFORCEMENT OF RAILWAY RATES PRESCRIBED BY STATE OR FEDERAL AUTHORITY.

50. The Nebraska Maximum Freight Rates Case.

51. The Texas Railroad Commission Case.

52. Whether the issuance of injunctions *pendente lite* in this class of cases may not operate to prevent enforcement of any rate schedule prescribed by statute or by administrative authority.

53. The alleged contrary practice in regard to injunctions in Great Britain.

INTERSTATE COMMERCE COMMISSION.

54. Its present power to establish and secure reasonable rates for transportation of passengers and freight over interstate railways; to prevent excessive rates, unjust discriminations, and undue preferences; to establish through routes and through rates; to establish uniform classification of rates.

INTERSTATE COMMERCE COMMISSION—Continued.

- 55. Its procedure in determining questions submitted to it; delay incident thereto; procedure in courts to review its decisions; defects therein and proposed remedies therefor.
- 56. English Railroad Commission; English laws against unreasonable rates, unjust discrimination and undue preferences; leading English court decisions on these questions.

GOVERNMENT OWNERSHIP OF LAND TRANSPORTATION.

- 57. Ownership and operation of street-car and suburban railways by municipalities; its advantages and objections thereto.
- 58. Ownership and operation by the United States of railroads engaged in interstate commerce; arguments for and against it.
- 59. Consideration of other methods of ownership and operation of railroads proposed as beneficial to the public.

TELEGRAPH AND TELEPHONE LINES.

- 60. Cost per mile of constructing and operating such lines in this country; number of interstate lines in the United States, exclusive of those owned and operated for their own use by railways; their mileage; amount of stock per mile issued; amount of bonded debt per mile thereof; consideration for such stock and bonds; total capital; gross earnings; net earnings; interest on bonds; dividends on stock; annual amount devoted to construction, equipment, repair, and betterments; surplus, how disposed of; charters of various States; State taxation and supervision.
- 61. Schedule of rates; basis thereof; rates for similar service in Great Britain and on the Continent; cause of excessive rates in this country as compared with those in Great Britain and on the Continent.
- 62. Consideration of advisability of the United States controlling telegraph and telephone lines for the use of the public as part of the postal system of the country.

PART III.—DIVISION A.—TRANSPORTATION BY WATER.

IN ITS RELATION TO EMPLOYEES ON VESSELS ENGAGED IN COMMERCE.

- 63. Our navigation laws as affecting employees on vessels engaged in commerce on the high seas; classes, manner, and terms of employment; treatment and provision for comfort and health on shipboard; discipline and penalties for its breach; redress of grievances at home and abroad; hospitals; sailor boarding houses; "crimps" and boarding masters; wages, reductions, deductions, and forfeitures; when performing duty of stevedores; desertion, penalties therefor; discharge, at home and abroad; when vessel sold or wrecked in foreign country; inspection of American vessels at home and abroad; what restraint on the overloading of vessels; consideration of general condition of our merchant sailors engaged in commerce on the high seas; abuses of and defects in system governing them; consideration of measures to correct them; proposed amendments to our navigation laws; foreign navigation laws; comparison with ours.
- 64. In its relation to employees in lake, river, and canal transportation.

DIVISION B.—TRANSPORTATION BY WATER IN RELATION TO THE PUBLIC.

VESSELS ENGAGED IN COMMERCE.

- 65. Proportion of American vessels engaged in our foreign commerce as compared with vessels under foreign flags so engaged; "lines" under our flag engaged in foreign commerce; "lines" under foreign flags so engaged; annual earnings of American vessels engaged in our foreign commerce; of foreign vessels engaged therein; "tramp" steamships; respects in which they differ from "liners;" relative cost of building, equipping, and running them; comparison of number of tramp steamships under American flag engaged in our foreign commerce with those of Great Britain, France, Germany, Russia, Italy, Holland, Sweden and Norway, and Spain.
- 66. Comparison of cost of building and equipping vessels for ocean commerce in this country with that of similar vessels in foreign countries; cost of operating them as compared with foreign vessels of similar character; comparison of wages of officers and crew of American vessels with those of foreign vessels; respects in which American shipowners are at a disadvantage as compared with foreign shipowners.

VESSELS ENGAGED IN COMMERCE—Continued.

67. Forms and characters of aid and subsidy to foreign vessels; to American vessels; résumé of laws of foreign countries intended to develop their merchant marine; registry laws of the United States; their effect on shipbuilding and on shipowning in this country.
68. Laws and regulations of the United States relating to transportation of passengers and freight on the high seas; accommodations for and treatment of passengers, cabin and steerage; immigrants, and laws relating to them; defects in such laws and proposed amendments; inspection; observance of our laws by foreign vessels engaged in transportation of passengers and freight; effect of quarantine and health laws on our ocean commerce; vessels engaged in transportation of live stock on high seas; laws and regulations relating thereto.
69. Our coastwise commerce; rates per mile for passengers and freight as compared with rates for similar service under like conditions in coast trade of other countries; competition between railway and water transportation on the Atlantic, Pacific, and Gulf seaboard; comparison of rates coastwise, where there is railway competition, and rates foreign from our seaboard.
70. Through bills of lading and through passenger tickets to and from the interior of the United States, from and to foreign countries and domestic ports; immigrant tickets.
71. Our commerce on the Great Lakes; its tonnage and number of vessels as compared with tonnage and number of American vessels engaged in our ocean commerce; as compared with number and tonnage of such foreign vessels; closed season on the Great Lakes; effect of the closing of lake navigation on rates of transportation between the Mississippi Valley and the seaboard; importance as a factor in maintaining reasonable rates; efforts to control freight rates on the Great Lakes; methods employed to that end.
72. Our river commerce; its tonnage; causes of decline thereof; railway competition by steamboat and barge lines controlled by competing railways; methods employed in such competition; cutting rates and "freezing out" competing steamboat lines; ultimate effect thereof on river commerce and transportation rates; consideration of the question of public policy involved in such methods and of restraining legislation.
73. Our canal commerce; its tonnage; its decline and causes thereof; where competing with railway transportation its influence on rates.

WASHINGTON, D. C., December 6, 1898.

TESTIMONY OF MR. EDWARD A. MOSELEY,

Secretary of the Interstate Commerce Commission.

The commission met at 11 a. m., December 6, 1898, Vice-Chairman Phillips presiding. Mr. Edward A. Moseley, secretary of the Interstate Commerce Commission, testified. Mr. Phillips suggested that the witness be guided by the syllabus on transportation in giving his testimony.

MR. MOSELEY. I desire to say that I am here in the capacity of an American citizen, who for many years has paid a good deal of attention to the relations between employer and employee, particularly in connection with railroad labor. I was at one time an officer in one of the largest labor organizations in this country, and have always taken a great interest in this subject. Then, as the secretary of the Interstate Commerce Commission, I have been brought into more or less intimate connection with the railroads and the relations which they bear to the public and to their employees, as well as to each other. It must be understood, however, that I do not in any manner represent the Interstate Commerce Commission, but I am here solely as a citizen whose whole heart is wrapped up in the subject of the relations between capital and labor and the proper position which they should occupy to each other. I therefore gladly make such suggestions as appear to me and which, I trust, will prove of interest to this commission. In doing so I am happy to follow the suggestion of Mr. Phillips, your chairman, whom I have long known as the friend of those interests which I desire to conserve so far as I can.

The first part of your "Topical plan of inquiry" relates to the "Character of duties and classification of employees of railroads and other carriers by land; their qualifications." First, regarding the wages of employees, I desire to pass that and come to the question of blacklisting discharged employees and compulsory performance of service under mandatory injunction.

Q. (By Mr. FARQUHAR.) Which section?—A. That is Part I, Section I, "Wages of employees." I do not now know of any demand by the employed that further legislation be had in regard to blacklisting in amendment of the law as it now stands. It forbids blacklisting. I allude to section 10 of the arbitration act of June 1, 1898.

After the "Chicago strike" there was a large number of employees thrown out of employment who have never been able to obtain employment again. It is alleged that these men would go to the railway managers and ask for certificates of good character to enable them to get employment elsewhere, but that the certificate obtained worked them harm rather than good, for by a method of writing the certificate or by use of certain watermarks, or other means, the paper of apparent recommendation proved to be notice to the person receiving it that the applicant was blacklisted; that there was a very large amount of this blacklisting done even where to all outward appearances strong letters of recommendation had been given. So much of a wrong had this become that when the arbitration act was enacted by the last Congress, approved June 1, 1898, in the tenth section, which is next to the last section, it is positively forbidden in any way to blacklist a man, and is made a misdemeanor to do so. I call the attention of the commission to this law. It is the act concerning carriers engaged in interstate commerce and their employees. I will read section 10:

"That any employer subject to the provisions of this act and any officer, agent, or receiver of such employer who shall require any employee, or any person seeking employment, as a condition of such employment, to enter into an agreement, either written or verbal, not to become or remain a member of any labor organization, corporation, association, or shall threaten any employee with loss of employment, or shall unjustly discriminate against any employee because of his membership in such labor corporation, association, or organization; or who shall require any employee, or any person seeking employment, as a condition of such employment, to enter into a contract whereby such employee or applicant for employment, shall agree to contribute to any fund for charitable, social, or beneficial purposes to release such employer from legal liabilities for any personal injury, by reason of any benefit received from such fund beyond the proportion of the benefit arising from the employer's contribution to such fund; or who shall, after having discharged an employee, attempt or conspire to prevent such employee from obtaining employment, or who shall, after the quitting of an employee, attempt or conspire to prevent such employee from obtaining employment, is hereby declared to be guilty of a misdemeanor, and, upon conviction thereof in any court of the United States of competent jurisdiction in the district in which such offense was committed, shall be punished for each offense by a fine of not less than one hundred and not more than one thousand dollars."

Blacklisting, of course, is one of those evils which is extremely difficult to meet—to make any law which is effective against the practice. If a person does not wish to employ a man, or wants to see that someone else does not employ him, the methods of doing so and preventing the applicant from gaining employment on other railroads are easily found, and it is very hard indeed to reach it by effective legislation. Congress has, however, put its stamp of disapproval on it and made it a misdemeanor, and I do not now know how to strengthen the law in this particular; still, I believe there is a necessity for at least making the attempt to stamp out blacklisting effectively, and I urge this commission to fully consider this subject with that end in view.

"COMPULSORY PERFORMANCE OF SERVICE UNDER MANDATORY INJUNCTION."

Some time ago an engineer in the service of the Lake Shore and Michigan Southern Railway was charged with contempt and punished. Lennon was a locomotive engineer in the service of the Lake Shore, and a member of the Brotherhood of Locomotive Engineers. The engineers of the Toledo and Ann Arbor line had gone out on a strike and the Brotherhood had requested its members on the Lake Shore not to haul the Ann Arbor cars. The Ann Arbor got an injunction against the Lake Shore and its employees, prohibiting them from refusing to haul its cars. Lennon refused to take a car from the Ann Arbor road, though ordered to do so. Judge Ricks ordered his arrest and found Lennon guilty of violating the injunction in refusing to haul such car, adjudged him to be in contempt, and fined him \$50 and costs, or else remain in jail until the fine should be paid. Len-

non took out a writ of habeas corpus, which was denied. He then appealed to the Supreme Court of the United States, which dismissed the appeal, holding that it had no appellate jurisdiction in the case. Then he went to the circuit court of appeals, which affirmed the decree of the circuit court, wherefrom he obtained a writ of certiorari from the Supreme Court, which affirmed the decision of the circuit court of appeals. Lennon staid in jail for some time, but finally paid his fine. Such "proceedings for contempt" ought to be fairly looked into, whether the road is in the hands of a receiver or not, as the question is one in which the railroad brotherhoods of the country are to-day very much interested. Such employees should not be punished for contempt for acts done outside of the purview of the court. This matter has proceeded to such an extreme that in a case on the Northern Pacific Railroad the judge of the court enjoined Mr. Arthur, chief executive officer of the locomotive engineers; Mr. Sargent, chief executive officer of the firemen; Mr. Clark, chief executive officer of the conductors; Mr. Wilkinson, chief executive officer of the trainmen; Mr. Ramsey, chief executive officer of the telegraphers, and Mr. Wilson, chief executive officer of the Switchmen's Mutual Aid Association—all heads of their various brotherhoods and hundreds of miles away—from in any way consulting with the members of their brotherhoods in regard to the question of wages, or the hours of labor, or in regard to any question which was then in dispute.

In this connection I will read a memorandum which I have upon injunctions to restrain strikes, boycotts, and conspiracies against interstate commerce.

"INJUNCTIONS TO RESTRAIN STRIKES, BOYCOTTS, AND CONSPIRACIES AGAINST INTERSTATE COMMERCE.

"Strikers refusing to work, and intimidating employees by threats or menaces to prevent them from continuing in the performance of their duties or employment, will be enjoined. (*Lake Erie and W. R. Co. v. Bailey*, 61 F. R., 494; *Wick China Co. v. Brown*, 164 Pa., 449; *McCandless v. O'Brien*, 21 Pitts. L. J. N. S., 435; *Perkins v. Rogg*, 28 Ohio L. J., 32; *Murdock v. Walker*, 152 Pa., 595; *Cour d'Alene Consol. Min. Co. v. Miners' Union*, etc., 51 F. R., 260.)

"Where the request to quit was accompanied by the intimation that there will be bloodshed and riot, an injunction was allowed. (*N. Y., L. S. and W. R. Co. v. Wenger*, 17 Week. L. Bull., 306.)

"Interference with business by preventing the employment of sailors for a steamship owned by subjects of Great Britain will be enjoined on the ground of preventing multiplicity of suits and inadequacy of remedy at law; but it can not be granted under the antitrust law in a suit brought by any party except the United States Government. (*Blindell v. Hagan*, 54 F. R., 40; 56 F. R., 606.)

"An injunction was granted against displaying banners in front of plaintiff's premises calculated to injure his business and to deter workmen from entering his employ. (*Sherry v. Perkins*, 147 Mass., 212.)

"An injunction was granted against members of a labor union who boycotted plaintiffs because they refused to reinstate discharged employees. (*Brace Bros. v. Evans*, 5 Pa. Co. Ct. Rep., 163.)

"A boycott against a newspaper for publishing 'patent insiders,' which reduced wages, was enjoined. (*Barr v. Essex Trades Council* (N. J.), 30 Atl. Rep., 881.)

"A boycott against a printing office for refusal to unionize the same and pay laborers union prices, was enjoined. (*Casey v. Cinn. Typ. Union*, 45 F. R., 135.)

"A court of chancery can enjoin false publications tending to injure trade. (*Collard v. Marshall* (1892), 1 Ch., 571.)

"Printing and publishing placards for the purpose of intimidating workmen, as a part of a scheme to prevent work and destroy the value of plaintiff's property, was enjoined. (*Springhead Spinning Co. v. Riley*, L. R. 6 Eq., 551.)

"An association devoting funds to support striking workmen was enjoined from misappropriating such funds. (*Warburton v. Huddersfield Ind. Soc.* (1892), 1 Q. B., 213.)

"An injunction against libelous circulars denouncing plaintiff's workmen as "scabs" will not be granted where it is not shown by the evidence whether employees were compelled to leave through moral suasion or by intimidation, or whether alienated customers derived their information from the circulars or from other sources. (*Richter v. Journeyman Tailors' Union*, 24 Ohio L. J., 189.)

"A court of equity will prevent a combination to interfere with or injure plaintiff's business by force, threats, intimidation, or menace of harm or violence. (*Sweeny v. Torrence*, 11 Pa. Co. Ct. Rep., 497.)

"Peaceable persuasion of employees to quit, and paying their expenses, and posting in the union labor halls the names of contributors to the funds, was not enjoined. (*Rogers v. Evarts*, 17 N. Y. Supp., 264.)

"If there is no irreparable injury and the strike is over, the dissension of the trial court in refusing to grant perpetual injunction will not be reviewed. (*Reynolds v. Everett*, 67 Hun., 294; 144 N. Y., 189.)

"Where plaintiff's hands were enticed away, but no coercion is shown to be committed or intended, an injunction was refused. (*Johnston Harvester Co. v. Meinhardt*, 9 Abb. N. C. 393; 24 Hun., 489.)

"Equity will not enjoin a blacklisting of employees. (*Worthington v. War- ing*, 157 Mass., 421.)

"Indictment under United States Revised Statutes, sections 5399, 5440, making it criminal to obstruct justice in the Federal courts or to conspire to do so, not alleging that the defendants conspired to violate the injunction of the court which had been issued or to interfere with its proceedings and not alleging notice to the defendants of the pendency of proceedings or issue of injunction, was invalid, although it alleged a conspiracy to intimidate employers to discharge the employees. (*Pettibone v. U. S.*, 118 U. S., 197.)

"An injunction was refused to prevent persecution of plaintiff's company by strikes, boycotts, or violence, or intimidation, as no threat to do any unlawful act was shown. (*Mayer v. Journeyman S. C. Ass'n.*, 47 N. J. Eq., 519.)

"A conspiracy to destroy or injure the business of another, or doing violence to his property or property rights, where the injury is threatened and imminent and will become irreparable to the suitor, or intimidation of workmen, will be enjoined; but in this case an injunction was refused because the petition did not show that the damages would be irreparable, and failed to connect the defendants directly with the damages shown. (*Longshore Fr. and Pub. Co. v. Howell*, 26 Oreg., 527; 28 L. R. A., 464, the notes to which make up most of this brief.)

"Under the interstate commerce act, a combination or conspiracy of persons to hinder, obstruct, or interfere with the business or management of any interstate railroad company by threats, intimidation, force, or violence against such railroad companies or their employees in the discharge of their duties, will be enjoined. (*Sou. Cal. R. Co. v. Rutherford*, 62 F. R., 796; *U. S. v. Workingmen's Amal. Council*, 54 F. R., 994; 57 F. R., 85; *U. S. v. Elliott*, 63 F. R., 801; *U. S. v. Agler*, 62 F. R., 824; *C. C. and Q. R. Co. v. C. C. R. and N. R. Co.*, 34 F. R., 481; *Toledo A. A. and N. M. R. Co. v. Penn. Co.*, 54 F. R., 730, 746; *Farmers' Loan and T. Co. v. N. P. R. Co.*, 60 F. R., 803; *U. S. v. Debs*, 64 F. R., 724; 158 U. S., 564.)

"Under the antitrust act, a conspiracy and combination to hinder the operation of railroads engaged in interstate commerce will be enjoined. (*U. S. v. Elliott*, supra; *U. S. v. Agler*, supra.)

"Prior to the United States antitrust act, the circuit courts of the United States had not equitable jurisdiction to prevent such acts. (*U. S. v. Agler*, supra, but see *U. S. v. Debs*, supra.)

"Arthur's disclaimer of knowledge of a prior injunction against the railroads and their employees was held immaterial to the question of the injunction against him. (*Toledo, A. A. and N. M. R. Co. v. Penn. Co.*, 54 F. R., 730.)

"Employees will be restrained from enforcing rules of their labor union which injure the company or the public, and they need not be made parties defendant. (*Toledo, A. A. and N. M. R. Co. v. Penn. Co.*, 54 F. R., 746; ex parte Lennon, 64 F. R., 320; 150 U. S., 393.)

"In the Debs Case, supra, an injunction was granted against the officers of the A. R. U., and all persons combining with them, to desist and refrain from hindering, obstructing, or stopping any of the business of certain railroads as common carriers of passengers, freight, or mails, and from entering the premises of said roads for any of said purposes, and from compelling or inducing, or attempting to compel or induce by threats, intimidation, persuasive force, or violence, any of the employees to refuse or fail to perform any of their duties as employees on any of the roads engaged in interstate commerce or carrying mails; and from compelling or inducing, or attempting to compel or induce by threats, intimidation, force, or violence any of said employees to leave the service, and from preventing any person by such means from entering the service, and from doing any act in furtherance of any conspiracy or combination to restrain the railroad companies or receivers in the control of the same, and from ordering, directing, aiding, assisting, or abetting any person to commit any of said acts. Interference by intimidation or force with receivers in the management of a railroad preventing employees from working is a contempt of court, and the order appointing a receiver in effect prohibits any disturbance of possession. (*Secor v. Toledo, P. and W. R. Co.*, 7 Biss., 513; *King v. Ohio and M. R. Co.*, 7 Biss., 529; *Thomas v. C. N. O. and T. P. R. Co.*, 62 F. R., 803.)

"The order of the Brotherhood of Locomotive Engineers preventing the handling of freight of certain roads was contrary to the interstate commerce act. (*Waterhouse v. Comer*, 65 F. R., 149.)

"The United States anti-trust law does not apply to all attempts to restrain commerce between the States by strikes and boycotts, but applies to monopolies. (*U. S. v. Patterson*, 55 F. R., 605.)

"Any interference with the possession of receivers by attempts to control the management, or cripple the property, or hinder or obstruct its operation, or intimidate the employees or persons desirous of obtaining such employment; or any acts of violence directed against such receiver or the property or employees, in pursuance of a conspiracy to cripple the operation of the business intrusted to the receiver, is a contempt of the court appointing him and will render the parties liable. (*Re Higgins*, 27 F. R., 443; *Frank v. Denver and R. G. R. Co.*, 23 F. R., 757; *U. S. v. Kane*, 23 F. R., 748; *Arthur v. Oakes*, 63 F. R., 310; *Secor v. Tol., P. and W. R. Co.*, 7 Biss., 513; *King v. O. and M. R. Co.*, 7 Biss., 529; *Waterhouse v. Conner*, 55 F. R., 149.)

"A request to engineers of a railroad not to act without the consent of the strikers was a threat and intimidation. (*Re Doolittle*, 23 F. R., 544.)

"A receiver of a railroad is not bound by an agreement, made before his appointment, between the railroad company and its employees, whereby the latter are not to be discharged except for cause, to be determined by arbitrators. (*In re Seattle, L. S. and E. Ry. Co.*, 61 F. R., 541.)

"An injunction to prevent discharge because member of labor organization was denied. (*Platt v. Phila. and R. R. R. Co.*, 65 F. R., 660.)

"A boycott by the members of trades unions or assemblies (which term, in law, implies a combination to inaugurate and maintain a general proscription of articles manufactured by the party against whom it is directed) is unlawful, and may be enjoined by a court of equity. (*Oxley Stove Co. v. Coopers' Int. Union of N. A.*, 73 F. R., 695; *Hopkins v. Oxley Stove Co.* (same case on appeal), 83 F. R., 912.)

"A conspiracy to prevent the loading or unloading of a vessel, except by such labor as may be acceptable to defendants, may be enjoined, though no particular overt act against that particular vessel is alleged or proved. (*Elder v. Whitesides*, 73 F. R., 724.)

"An injunction will be granted where members of labor organizations conspire unlawfully to interfere with the management of the business of a corporation, and to compel the adoption of a particular scale of wages, by congregating riotously and in large numbers at and near the works of the corporations for the purpose of preventing persons, not members of said organizations, from entering the employ of the corporation or remaining therein, by intimidation, consisting in physical force or injury, actual or threatened, to person or property. The jurisdiction of equity is not ousted because the acts complained of may also be the subject of indictment. (*Consolidated Steel and W. Co. v. Murray*, 80 F. R., 811; *Mackall v. Ratchford*, 82 F. R., 41.)

"A notice to the foreman of the shops of a railroad, requesting him to stay away from work until the strike was settled, 'But in no case are you to consider this an intimidation,' signed by the chairman of the committee of striking employees, is a threat and renders him guilty of contempt of court. (*Re Wabash R. Co.*, 24 F. R., 217; *U. S. v. Berry*, 24 F. R., 780.)

"An injunction can not make men continue in the service, and an injunction against interference with the employees of a receiver can not make it any more of a contempt, as the law itself imposes an injunction, and injurious effects are caused by injunctions, creating the belief that it is not an offense to interfere if no injunction was issued. (*Ames v. Union Pac. R. Co.*, 62 F. R., 7.)

"The marshal, without warrant, properly arrested a person interfering with the management of a railroad in the hands of a receiver by attempting to induce men to quit work, but as the prisoner was held in custody for a month without examination, he was released on habeas corpus. In this case there was an order of court directing the marshal to attack all persons interfering with the possession of the receiver. (*Re Acker*, 66 F. R., 290.)

"Telegraphers were enjoined from interference with property, operations, or employees of the receiver, and rules were issued against persons interfering. (*Telegraphers v. Comer*, unreported, but referred to in *Waterhouse v. Comer*, 55 F. R., 149.)

"Where the receiver refused an interchange of freight on account of a boycott by Brotherhood of Engineers, but rescinded his order or disclaimed all connection with the chief of the brotherhood, the petition for injunction was allowed to remain on file for future action, if necessary. (*Beers v. Wabash, St. L. and P. R. Co.*, 34 F. R., 244.)

"On December 13, 1893, Judge Jenkins, of the United States circuit court, issued an injunction in the case of *F. L. and T. Co. v. N. P. R. Co.*, supra,

restraining the employees of the Northern Pacific Railroad, about 12,000 in number, from 'combining and conspiring to quit, with or without notice, the service of the receivers, with the object and intent of crippling the property in their custody or embarrassing the operation of the railroad, and from so quitting the service of said receivers, with or without notice, as to cripple the property or prevent or hinder the operation of said railroad.' A second writ of injunction was issued December 22, 1893, containing in addition a clause enjoining all persons from 'ordering, recommending, approving, or advising others to quit the service of the receivers of the Northern Pacific Railroad Company on January 1, 1894, or at any other time.' On mature consideration, however, this extraordinary clause was withdrawn on petition of the principal labor organizations among the employees. The court, however, refused to modify the original injunction forbidding the employees from quitting the service of the receivers. An appeal was consequently carried to the United States circuit court of appeals, which, October 1, 1894, overruled the court below on the ground that an equity court should not intervene to compel the effective performance of a contract. (See *Arthur v. Cakes*, 63 F. R., 310.) Said Mr. Justice Harlan in that decision: 'It would be an invasion of one's natural liberty to compel him to work for or to remain in the personal service of another. One who is placed under such constraint is in a condition of involuntary servitude, a condition which the supreme law of the land declares shall not exist within the United States or in any place subject to their jurisdiction. * * * In the absence of legislation to the contrary, the right of one in the service of a quasi public corporation to withdraw therefrom at such time as he sees fit, and the right of the managers of such a corporation to discharge an employee from service whenever they see fit, must be deemed so far absolute that no court of equity will compel him, against his will, to remain in such service or actually perform the personal acts required in such employments, or compel such managers, against their will, to keep a particular employee in their service.' 'Whether organized labor has just grounds to declare a strike or boycott is not a judicial question,' said Judge Caldwell in his able dissenting opinion in the *Oxley Stove Company Case*, *supra*. 'These are labor's only weapons, and they are lawful and legitimate weapons; and so long as in their use there is no force or threats or violence, or trespass upon persons or property, their use can not be restrained.' Laborers are not wards of chancery. A court of chancery has no more authority to interfere with labor organizations in the conduct of their business than it has to interfere with the business of corporations and trusts and other combinations of capital in the conduct of their business; and in the case of a strike or a boycott, as long as each side is orderly and peaceful, they must be permitted to terminate their struggle in their own way, without extending to one party the adventitious aid of an injunction.'

I know of nothing more exasperating to the wage worker than the apparent arbitrary action of the courts in the issuance of mandatory injunctions in this class of cases and subsequent proceedings for contempt.

This use of the injunction fills many of these who are deeply interested in the welfare of their country with great alarm. It is a matter of the greatest surprise to Englishmen to observe the way in which the power of the court is strained in this respect. An injunction is never issued there without the greatest deliberation. In this country it seems to be had for the asking, particularly whenever an employer desires to get the influence of the court thrown into the scale in his favor when a dispute between himself and his workmen arises. Whatever warrant there may be for the Federal courts to interfere in disputes between the carriers engaged in interstate commerce and their employees, it is straining power for the Federal judges to interfere in those disputes which are simply between those engaged in ordinary industrial pursuits and their employees. It is bringing the Federal judiciary into disrepute, and if something is not done to curb this unjustifiable act on the part of some of the Federal judges it will surely bring disaster to our institutions.

In the first place, a railroad employer or manager, anticipating a difficulty which is apparently about to take place, rushes to a friendly court. I want to state just for a moment in regard to this *Lemon* case. It is stated that the judge in this case was at his home in Cleveland and was summoned by telegraph; was rushed through in the special car of the corporation to Toledo; went to the offices of the railroad company, where the railroad officials presented their side of the case to him behind the closed doors of the railroad corporation, and where also he issued the injunction, and the first knowledge that the men had of the action was when the injunction was served on them. They had no opportunity—there was no chance for them to say a word, and there was no chance for them to explain to the court. The court took the one side at once and threw its whole influence to the railroad.

This commission will give the railroad employees, through their representatives, an opportunity to be heard, and they will convince you that this is a question which needs the most careful consideration on your part. This is a matter which concerns every wage worker in the country. Their representatives will fairly present this question to you. There ought to be a law prohibiting courts of the United States from enforcing the specific performance of contracts for personal service by writs of injunction. The following bill to to this effect has been suggested:

"A BILL to prohibit courts of the United States from enforcing the specific performance of contracts for personal service by writs of injunction or other legal proceedings.

"SECTION 1. *Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled*, That no judge of any court of the United States shall enforce or attempt to enforce the specific performance of any labor contract, or contract expressed or implied, for continuous personal service by the writ of injunction or any other legal process whatever: *Provided*, That the right of action at common law for damages for breach of such contracts is not hereby abridged."

Though since the passage of the arbitration bill of June, 1898, I seriously doubt if any Federal judge will ever undertake again to force men against their will by injunction.

I do not come here—neither will the railroad employees through their representatives come here—and say that there are not circumstances under which a railroad employee is just as much bound to continue his employment as is a pilot on board ship in a dangerous sea way. A railway engineer dissatisfied with the terms of his employment has no business to leave a train load of passengers out on a prairie. A freight engineer has no right to leave his train in a position where it endangers the lives of others. There is right and reason in all things. The railway employee recognizes that to a certain extent he is performing a public service, and to that extent he is a public servant; that the railroad is performing a public service and he, as a servant of the railroad, owes a duty to the public which those engaged in the ordinary industrial pursuits do not. The man engaged in the cotton factory, the man engaged in any ordinary vocation, can leave his employment at any time, at any hour, and in any way, and the public can not properly question his right to do that; but in the case of the railroad and the railroad employee the great overpowering third party, the public, has certain rights, and the railway employees recognize those rights. In that respect I think they differ from other organizations or employments. They stand on a different plane, occupy a different relation to the public; and as the general public has a right to demand from them certain service, they must have equal right to demand and expect from Congress such measures of protection as are warranted. If not provided for by the National Government they are practically without such protection. Questions concerning those engaged in the ordinary industrial pursuits are largely matters for the several States to deal with.

Before leaving this subject, I desire to call attention to the Royal Commission on Labor, whose investigations began May 1, 1891, and whose final report was submitted June, 1894, in two volumes, the majority report signed by nineteen and the minority by four commissioners. Their work is comprised in 65 blue books, 25 being taken up with the testimony of witnesses. In addition to these reports, the blue book contains separate statements of the individual views of certain members of the commission of much interest and value.

I will read the propositions stated by Sir Frederick Pollock in the minority report of the Royal Commission on Labor:

"Let us apply these principles (previously considered by Sir Frederick in his minority report) to some of the ordinary facts of trade disputes. I submit the following propositions as being fairly deducible:

"(1) Neither an arrangement for a strike, immediate or contingent, among workmen in any trade, nor an agreement for a lockout among masters, is an enforceable contract; but neither is in itself punishable or wrongful.

"(2) A strike (or lockout) begun without breach of any existing contract does not necessarily involve any wrongful act.

"(3) But if a strike is begun by stopping work in breach of an existing contract, the employer probably has a right of action against the promoters of a strike for procuring that breach of contract. A workman would have the same right against anyone who procured his employer to dismiss him in breach of existing terms, either individually or by way of general lockout. And generally whatever can be said of a workman's freedom to choose his employer may be said of an employer's freedom to choose his workmen.

"(4) Individual workmen are free to renew or not to renew their contracts, or to enter or not to enter into contracts with other employers, as they think fit. And all persons are free, if they think fit, to lay before workmen, individually or collectively, facts and reasons in favor of their doing or not doing any of these things. The like as to customers resorting or not resorting to any particular place of business or dealing with any individual trader.

"(5) But no one is free to deprive an employer of his workman's services, or of the custom of those who may deal with him, by violence or unlawful interference of any kind with person or property, nor by threats thereof. Any such act is a trespass against the employer as well as against the workman or customer intimidated. And the rule seems to extend to threats of doing harm by means of a breach of contract or other definite civil wrong.

"(6) An agreement not to work with or not to employ any particular class of persons (as a rule of a trades union not to work with nonunion men, or of an association of masters not to employ members of a particular union) is probably 'in restraint of trade' and not enforceable, but not wrongful.

"(7) Any of the acts above mentioned which is not wrongful in itself does not become wrongful.

"(a) Merely because done by a number of persons acting in concert; or

"(b) Merely because those persons give notice to an employer or other person concerned of their intention to do such acts.

"It seems, therefore, that an employer has not any civil right of action against, e. g., the officers of a trade union who threaten him with a strike of union hands (not involving violence or breach of contract), if he continues to employ nonunion men in general, or particular men objected to by the union.

"(8) It is not that interference with a man's business by persons having no definite interest of their own to serve thereby (for example, an agreement not to deal with a certain trader at all, or to prevent others from doing so) might not be held to be without just cause or excuse, and therefore an actionable wrong, even if it did not involve the committing, procuring, or threatening of any breach of the peace, or breach of contract, or other specific wrongful act.

"If any one thinks that the law laid down by the House of Lords does not sufficiently protect individual freedom of action, he may partly console himself reflecting on the obvious fact that, whatever the law may be, there will still be a thousand ways beyond the reach of legal process in which a majority in any trade or society can make it unpleasant for the minority to differ with them. Ultimately the rights of minorities can be secured only by securing general respect for every citizen's lawful freedom of action and discussion; and this must be the work of enlightened public opinion, and not of legal definitions; judgments and statutes, which embody, or ought to embody, the best wisdom and experience of the nation may do something to guide and form public opinion; they can not take its place.

"I am not aware of any existing legislation which, with regard to civil liability, could be held to affect the results of common-law principles.

"This statement concludes nothing as to the criminal law. Many civil wrongs (including some of those above mentioned) are certainly not criminal offenses. On the other hand, acts which are not a civil wrong to any definite person may be deemed so contrary to the public welfare that they are made a punishable offense. 'There are some forms of injury,' both civil and criminal, 'which can only be effected by the combination of many persons.'

"Things which are harmless or trifling when done by one or by a few may be a nuisance, or a danger to the public peace, and therefore criminal, when done and repeated by the multitude.

Sir Frederick, after making the foregoing summary of principles as related to the civil law, then proceeds to consider the bearing of the criminal law upon cases of strikes, lockouts, etc. (See *Id.*, pp. 160, 161.)

These reports, majority and minority, 1894, of above commission are most valuable, and should be in the library of this commission.

A very condensed epitome of some 240 pages, called the Labor Question, was printed shortly after the report in 1894 by T. G. Spyers, precis or special writer to the commission, covering their three years of investigation and summarizing the results. I also submit for your consideration some extracts from this epitome, with minutes of observation made in reading his very interesting summary of that important investigation.

TRADE UNIONISM AS RELATED TO AND CONNECTED WITH SOCIALISM.

Socialism may be defined as the blending of political and industrial functions. It contemplates the state becoming the sole landlord, the sole capitalist, and the sole employer of labor. It derives its strength from the political enfranchisement

of the industrial class, which has had the effect of directing the action of the state to the solution of industrial problems.

Another force and influence connected with trade unionism is cooperation, or the association of workmen to become their own employers. Its success may be said to have originated with the establishment of the Rochdale Pioneer Society, in 1844. It now embraces no fewer than 1,624 societies, which have an aggregate capital of over £16,000,000, and do a trade of about £50,000,000 a year, at a net profit of nearly £5,000,000.

"The labor movement," says the author in summing up the foregoing considerations, "is a complex, genuine, human force, at once too vigorous to perish and too strong to be crushed. The problem, therefore, is to bring it into harmony with existing industrial conditions and to turn it from the abuses of industrial warfare to the uses of industrial peace." (Pages 1-10.)

"Collective bargaining" is a phrase invented to express the attitude of trade unionism and is said to be its very essence. Viewed internally its policy is "collectivism;" viewed externally its policy is "bargaining." Trade unionism does not allow its members to fight their battles individually and separately, but aims to focus the efforts of all upon a common object, and then as a "collective" body, as a unit, demand and "bargain" for a higher rate of wages or other concession from employers.

At the beginning of the century the "combination acts" expressly forbade a number of men from agreeing together to send in on the same day their notices to quit work. But these acts have been repealed. Even in England they could not stand against the force of public sentiment. Compare the spirit of such acts with the late decision of Mr. Justice Harlan, of the United States circuit court of appeals. The repeal of the oppressive acts and the interpretation of the law as laid down by Justice Harlan mark decided progress and give encouragement to trade unionism.

The evidence before the royal commission relating to the development, organization, and conduct of strikes was very full and interesting. The methods pursued by the trade unions were what are termed "picketing," that is, stationing men in the neighborhood of a place where a strike is going on to inform the workmen of the fact, collection of subscriptions for maintaining the strike, efforts to extend the strike over a larger and larger area, and consolidation of the federation.

The employers resorted in their methods to blacklisting, employing and organizing nonunionists, extension of the lockout over larger areas, and eviction.

All these means and methods are of course exactly parallel with the means and methods used in the late strikes and lockouts in the United States.

The conspiracy and protection of property act, now in force in England, while expressly declaring the legality of "picketing" for the purpose of giving information, forbids any person from intimidating or persistently following another to induce him to quit work, under penalty of imprisonment or fine. No doubt our own courts would sustain the principle involved in this law.

"One of the most interesting features of industrial politics," says the author, "is the way in which trade unions generally contrive to make their hold over their members effective. The most common device is to create a fund for the purpose of providing friendly society benefits, and to give to each member a direct personal interest in keeping up his connection with the organization. The success of this policy is evidenced by the fact that the unions that give the most benefits of this kind are at once the strongest and the best able to command the confidence of the employers."

The last clause I have underscored to call attention to a fact that obtains in this country as well as in England. Our brotherhoods of locomotive engineers, of locomotive firemen, of trainmen, of conductors, it is not too much to say, command the respect and confidence of their employers largely by reason that the brotherhoods are drawn together by their benefit funds into a consolidated and well-organized body of moral, industrious, and self-respecting men. For, be it observed, temperance, sobriety, and moral character are, by brotherhood rules, made a condition precedent to membership and to enjoyment of benefit funds. (See these provisions set out in Sixth Annual Report of Interstate Commerce Commission, for 1892, p. 333.)

The author sums up as follows: "The essence of trade unionism is 'collective bargaining,' and 'collective bargaining' is made possible when the rival organizations of employers and employed, being imbued with a desire for industrial peace, survive the hostilities they originally came into existence to conduct and provide their representatives with definite and homogeneous constituencies." (Pages 11-31.)

Conciliation and arbitration.—The difficulty of obtaining suitable and competent arbitrators was shown by the evidence before the commission. Trade-unionists said that the clergy, judges, barristers, mayors, members of Parliament

were objectionable. They either would not be possessed of the technical skill requisite, or they would not be disinterested. Disinterestedness and sympathy, as well as acquaintance with the technicalities involved in the dispute, are indispensable qualities for a successful arbitrator.

The main obstacle to compulsory State arbitration is the absence of a body of law on which decisions could be based.

Arbitration in trade disputes must be suffered to develop. It can not be manufactured and its growth can not be forced; and the author comes to the conclusion that compulsory State arbitration, in the absence of a body of law on which to base decisions, is impossible. Voluntary State arbitration which did not base its awards upon a knowledge of the traditions and customs of the trade and the district, would not be accepted. There must be found competent and disinterested arbitrators, well acquainted with the traditions and customs of the particular industry involved in the dispute, acquainted, too, with the practical work and technicalities of true industry. (Pages 32-47.)

The question of industrial remuneration is next considered.

Mr. Giffin put in evidence some interesting figures, showing the average annual income of the adult male laborer to be £60, and of laborers of every age and sex £48; and stated that of a total national income of £1,500,000,000 about £633,000,000 was appropriated to the manual laborers in the form of wages, as against £867,000,000 appropriated otherwise.

But a very large portion of the £867,000,000 represents wages other than the wages of manual labor; yet, notwithstanding this and other exceptions mentioned, the main statement may be taken as a rough and approximate showing of the relative income derived by the labor of England.

Thereupon follows a discussion of the question whether the rate of wages should be fixed by law—either specifically or by fixing a minimum price—and the author says that “the large majority of the representatives of all classes in the industrial world concurred in expressing emphatic disapproval of State action in fixing the rates of wages.”

But although the workers desire the Government to do nothing toward fixing the rates of wages as a Government, they want it to do a great deal as an employer of labor. All the socialist and trade-union representatives agreed in thinking that the Government ought to lead rather than follow the market in determining the wages of its own employees; it should pay the full trade-union rates, and should take care that its contractors did the same. This point was brought very prominently forward by the socialists, who must have felt that the grievances of Government employees in regard to their low scale of wages constituted a standing argument against their favorite doctrine that industrial functions are better discharged by political than by purely industrial bodies.

Profit sharing is discussed in the light of the evidence adduced before the commission. This is a device for minimizing the fluctuations in the profits and wages themselves by throwing them upon a third fund created for that purpose, in which both parties, employer and employee, have an equal interest. Thus wages are paid at a fixed rate, and profits are also paid at a fixed rate, and what is left is divided between the wage and profit earners respectively.

It is plain that if the scheme is to work at all neither profits nor wages must be fixed so high as to leave nothing in the third fund to be divided. So much as to sharing the profits. But how about sharing the losses? Will the workmen share losses as well as profits? The fact is that the authors of such schemes have never provided any machinery by which losses are to be shared. Every system yet proposed presupposes an established and successful—profitable—business.

For these and other reasons, Mr. Giffin pointed out that profit sharing was unlikely to solve the whole problem of industrial remuneration.

There are at present a total number of 77 profit-sharing firms, the largest being the South Metropolitan Gas Company, which employs only nonunionist workers. The plan of this company in its details is merely a means of insuring against strikes and trade unionism. The workmen, however, support it, because the company pays the full rate of trade-union wages, and there is nothing to gain by refusing to accept the bonuses, if any.

It is clear that the natural attitude of trade unionism is hostile to profit sharing.

There is to be noted a certain kinship between profit sharing proper and the following methods of remuneration: Cooperative production, where the workers monopolize both profits and management; industrial partnership, where they share, but do not monopolize them; gain sharing, or associated piecework, where groups of men share in such portion only of the profits as is derived from economy of labor, and piecework proper, where individuals are paid according to the value of their work. All these are methods of payment by result, and therefore out of

a different fund from the wages which are advanced before the result is achieved. For this reason it is the natural instinct of the trade unions to oppose them; the evidence given by their representatives before the commission proves that, in the absence of any special reason to the contrary, they generally do so. (Pages 48-66.)

The subject of "Hours of labor" comes next. It is asked, Whence comes the demand for a regulation of the hours of labor? The demand does not represent the unanimous voice of the workers. It does not proceed from any of the 6,000,000 nonunion workers, who, whether from principle or force of circumstances, do not demand any system of industrial regulation whatever. It does not proceed from all even of the 1,000,000 trade unionists. Thus, the representatives of the organizations of hand nail makers, of nut and bolt makers, of coopers, and of the Boot and Shoe Operatives' Union, informed the commission that neither employers nor employed could exist under any system of regulations that prevented them from making up in good times for their losses incurred in periods of depression. In some cases, moreover, where the union officials are in favor of regulating and reducing the hours, the members themselves are opposed to it. Thus, Mr. Trow, representing the Associated Iron and Steel Workers' Union of Great Britain, said that an attempt on the part of an employer, acting in conjunction with the union executive, to introduce an eight-hour day in his works, had recently failed, owing to the determined opposition of the men, who positively refused to work under the new arrangements. In most unions, finally, where there is a majority of members in favor of regulation, there is a strong minority against it. But in spite of this, however, it seems that the principle of depriving the individual of his full freedom of contract in settling his hours of labor is accepted by the bulk of the trade-unionists of the country.

Second, as Mr. Mann pointed out, such freedom is irrevocably lost already inasmuch as modern business establishments can be conducted only on the basis of uniformity in the men's hours of labor. The individual has practically no voice in determining how long he is to work; he must work either the same hours as his fellows or not work at all.

That is true, but the author omits to remark that a proper law prescribing the hours of labor would take into account the whole "modern business establishment," and would fix, say, an eight or ten hour day, applying to every workman therein.

One can not fail to notice that this want of unanimity among British workmen of which the author speaks shows conclusively how clearly, among English workmen, subsistence presses upon wages; for if large masses of men demand freedom to contract, say, for a fifteen or eighteen hour day of labor, they do so, in fact, under compulsion of hunger or the fear of it. Does such a sentiment obtain in the United States? Certainly not.

The commission seem to approve of the general plan of empowering the local authorities of each district within their respective jurisdictions to make provision for regulating the hours of and portion of a trade within such jurisdiction on petition of a majority of the workers concerned. (Pages 67-84.)

"The employers' liability act" of 1893 anticipated, in some degree, the report of the commission upon this branch of its inquiry.

According to the common law, the liability of masters with respect to the personal safety of their servants was considered to arise solely from the terms of the contract of service. And, in the absence of express provisions to the contrary, every such contract was held to imply an undertaking on the part of the master to exercise due care to associate his servants with competent persons as mates and superiors. But here the master's responsibility was held to cease. Provided that he had exercised due care in the selection of the members of his staff, he was not held liable for the results of their subsequent actions toward one another. The absence of such liability was expressed in positive language in the well-settled doctrine of "Common employment" and of "Fellow-servants."

The extension of employers' liability to cases of pure accident is supported on the ground that, inasmuch as somebody must suffer, and the work that occasioned the accident was for the benefit of the employer, it is more just for the employer to suffer than the worker. The pleas of acquiescence and contributory negligence are of a quibbling nature and are provable on such flimsy grounds as to be a source of great injustice.

Various modifications of the law, objections to and arguments in favor of the law, are considered; also the practice of "contracting out," that is to say, entering into an agreement whereby the workman renounces the rights conferred on him by the act, and often his common-law rights also, to be indemnified for injury. (Pages 85-100.)

¹ "Factory acts" were investigated and considered. These acts relate to sanitation, safety and accidents, methods of paying employees, "sweating," employment of women, "young persons," and children, etc., and upward of sixty amendments were proposed by witnesses. (Pages 101-125.)

In Chapter V the socialistic questions are passed in review: Government employment as a substitute for private employment; nationalization of mines, railways, and canals; municipalization of land, water, and gas supplies, tramways dwelling houses, hospitals, docks, factories and workshops, etc.—in fact, the whole brood and spawn of notions and isms fathered by all the dreamers abroad, from Fourier to Karl Marx, and from Henry George and Bellamy to Pepper, at home.

The extension of the direct functions of the State to the various industrial functions is advocated on two distinct grounds: (1) That employment by purely industrial firms is inferior; and (2) that it is insufficient.

To make the State the sole employer of labor, the sole landlord, and the sole capitalist is the ultimate good of the socialist; and as a step toward the attainment of that good witnesses representing these ideas informed the commission that they desired to organize all local industries under municipal and county authorities. They even considered that the time had come when the State should enter into possession of all mines, with a view to intrusting their management to the county councils and confiscating the mining royalties; should buy out the railroad and canal companies, with a view to managing them directly through a public department. Further than that, they believed that the more wealthy municipalities, at least, should at once proceed to purchase the land in the towns and suburbs for the letting of small holdings to laborers; to buy out the water, gas, and street railroad or tramway companies; to build artisans' dwellings; to entirely support and control the hospitals; to purchase and administer all docks, and to start factories and workshops for doing the work which they would otherwise give to contractors.

In relation to Government ownership and control of railroads, Mr. Mann testified that the State, "instead of consulting the interests of a body of shareholders, should aid both at making traveling expenses as cheap as possible, and also at releasing railway employees from the long hours and other hardships which they are at present called upon to endure."

Mr. Webb's evidence was to the same effect.

Mr. Hyndman expressed himself as follows: "The first industry that the State should take over is the railways. They are the great highways of the country, but they have been converted by capitalist Houses of Commons in the past from being worked in the interest of the community to being worked in those of shareholders and directors. The cost of the acquisition by the State of this vast property would probably amount to about £1,100,000,000, but the money would be well spent. On becoming possessed of the means of transport the State should at once proceed to reduce its cost. The New York Central Railway, for example, compares very favorably in this respect with the London and Northwestern. During 1891 the average train loads on the former line were 250 tons, and the working expenses 285 pence per ton per mile; whereas on the latter the average train loads were only 65 tons, while the working expenses amounted to 658 pence per ton per mile. Yet the New York Central pays higher wages than the London and Northwestern, and at the same time charges less than one-third as much for its fares."

Yes, true; but the witness forgot to observe that the New York Central is not a Government-owned railway, and that the low rates are the natural result of competition.

"The worker's sole object," says the author, "is to get more wages for less work. The socialist may prove that State employment ought, logically, to enable him to get what he wants. But will it? Or, rather, since the State is already a very large employer of labor, does it? A review of the large portion of the evidence that related to the employees of the Government will enable the reader to supply the answer."

The evidence referred to, given by the socialists themselves, is a curious jumble and medley of facts unrelated to the conclusions drawn and openly contradicting their own theories, as the author, in his running criticism, abundantly shows.

The author proceeds to review the evidence touching the various kinds of "municipal ownership" as proposed by the socialists.

As to General Government ownership and control of industries the discussion is endless, both in England and in this country. In regard to Government ownership of railroads in the United States the discussion ought to be concluded, at least for the present, if facts are to govern the decision.

Note, for example, a statement recently prepared by the Interstate Commerce Commission, in compliance with a resolution of the Senate and submitted August 27, 1894.

"The freight rates," says this statement (page 7), "in the United States are, in general terms, only five-eighths of those charged on the Continent of Europe and a little less than one-half of those which prevail in Great Britain." As shown elsewhere in this statement, the railways on the Continent of Europe are largely owned and operated by Government. In Belgium, 71.81 per cent of the railway mileage is both owned and operated by the Government; in Denmark, 76.96 per cent so owned and operated; in France, 16.89 per cent; in Norway, 95.67 per cent; in Portugal, 37.86 per cent; in Prussia, including Finland, 50.75 per cent; in Sweden, 33.69 per cent; while in Austria-Hungary, 39.98 per cent of the mileage is owned and 73.35 per cent operated by the Government; and in Germany, 88.42 per cent is owned and 89.52 per cent is operated by the Government. (Page 6.)

See in this statement a mass of information compiled under "Views of various writers." (Page 9 et seq.)

The unemployed.—How can employment be provided was another question investigated by the commission. A wide diversity of views was expressed by the witnesses, some advocating the establishment of a national control labor bureau, others the encouragement of agriculture, others the formation of labor colonies, etc. (Pages 150-174.)

Mr. John Burns, the prominent labor leader, urged the Government to utilize the 18,000 offices as employment bureaus—a sample of the general socialistic tendency so prone to look to the Government in every stress and emergency. (See his article in *Nineteenth Century* for December, 1892.)

There is little in this part of the testimony that is relevant to conditions existing in the United States.

Some special subjects—mines and quarries, transport trades, agriculture, labor departments, and labor councils—are reviewed, and we come finally to the—

Recommendations of the commission.—As the result of its inquiries the commission have issued a blue book, containing two principal reports, one signed by 19 and the other by 4 of its members, and the recommendations contained in these reports may be briefly summarized as follows:

With reference to strikes and lockouts, the majority of the commission recommend an amendment to section 7 of the "Conspiracy and protection of property act" of 1875, relating to "picketing," so as to read, "uses or threatens to use violence to such other person," instead of "uses violence to or intimidates such other person."

As to arbitration, the majority desire to empower municipal and county councils to establish industrial courts to decide questions arising out of existing contracts or trade customs; to give one of the central government departments an adequate staff, with adequate means to procure, record, and circulate information relating to the work of voluntary conciliation boards, and, by advice and assistance, to promote their more rapid and universal establishment; and to give a public department, on receipt of a sufficient application from the parties interested or from local conciliation boards, power to appoint a suitable person to act as arbitrator, either alone or in conjunction with local boards or with assessors appointed by the employers and workmen concerned.

With reference to hours of labor, the majority propose to give a secretary of state power to regulate the hours of labor in any industry which he may certify to be, in his opinion, dangerous or injurious to health. Such orders they consider would be final if protected persons—i. e., women, young persons, and children are concerned—but as regards adult males, the orders should lie for a certain time upon the tables of both Houses of Parliament before becoming law.

A minority of the commission refer to employers' liability, and declare that the bill passed by the House of Commons, but rejected by the House of Lords, in 1893 embodied the reforms which they were disposed to recommend. They say that they are utterly opposed to any wage-earner being allowed to "contract out" in return for some individual advantage—"a privilege contrary, as they assert, to the whole principle of our industrial legislation."

It would seem that the majority of the commission were silent upon the above subject.

Upon the factory act, etc., the majority express the opinion that an act should be passed compelling every owner of workshops to obtain a certificate of the fitness of his premises and of the workshops of outworkers to be used for industrial purposes, especially in the case of manufacturers of clothing, books, and cheap furniture, and in case of bakehouses and laundries. They also recommended that young persons be prohibited from working overtime in certain trades.

With reference to state and municipal employment the minority recommended that all public bodies giving employment should, in explicit and widely advertised notice, adopt the eight-hour day; trade-union conditions and a minimum wage of 21s. per week; the express binding of public contractors, where such are employed, to adopt the same conditions; the establishment of a dock and harbor board composed of representatives of the London county council, the town council of Westminster, and other public bodies concerned, of the shipowners and of the dock laborers, with power to take over and administer the dock and wharves below London Bridge, etc.

The majority would seem to have made no recommendation upon this subject.

With reference to the unemployed, the majority consider that public authorities should hold overwork, needed but not urgent, with a view to furnishing employment in times of depression. The minority, on the other hand, recommend the undertaking of public works of a useful character, full wages being paid to the employed; the experimental establishment of labor colonies, and the grant of old-age pensions.

In the matter of mines the minority recommend the passage of an eight-hour law and the increase of the inspection force by the addition of practical working miners or miners' agents.

Upon this subject no recommendation of the majority appears.

As to transport trades, the majority recommend the amendment of the law, so that the wives of seamen may receive their husbands' pay fortnightly to the extent of one-half the pay due; the minority recommending, among other things, a weekly payment of two-thirds the pay due.

With reference to agriculture, the minority recommended Parliament to confer upon parish councils in Great Britain the same power of providing cottages as is possessed by boards of guardians in Ireland and by town councils throughout the Kingdom, and to make compulsory the laborers' (Ireland) act of 1881.

The majority are silent upon this topic.

Finally, touching the functions of the labor department, the majority recommended the engagement, under the department's direction, of a staff of skilled investigators to inquire into the conditions of labor and the formation of a census of occupations; the minority, on the other hand, favoring the foundation of a new department with many additional and enlarged functions.

"*The liability of railroads to employees for injuries sustained by the latter in the performance of duty*" and the "extent of the modification by statute of common-law rule as to the negligence of fellow-servants; legislation of States thereon and the effect thereof, etc." Upon this point I will preface my remarks by this statement: that so far as railroad employees are concerned there is hardly a case in which they are interested, suit for damages or any other matter, which does not ultimately reach the Federal courts, and if the Congress of the United States does not in some way undertake to legislate in regard to the matter or to control it, the existing state of affairs will continue, which is that in almost every court of the United States—Federal courts of the United States—there seems to be a different rule; there is no uniformity whatever upon the subject.

Hours of labor of employees of railroads and other carriers is not a subject upon which I care to dwell. That will be done by those representatives of labor who are thoroughly informed upon the subject. I desire, however, in this connection, to call your attention to section 9 of the arbitration act, as follows:

"SEC. 9. That whenever receivers appointed by Federal courts are in the possession and control of railroads, the employees upon such railroads shall have the right to be heard in such courts upon all questions affecting the terms and conditions of their employment, through the officers and representatives of their associations, whether incorporated or unincorporated, and no reduction of wages shall be made by such receivers without the authority of the court therefor upon notice to such employees, said notice to be not less than twenty days before the hearing upon the receivers' petition or application, and to be posted upon all customary bulletin boards along or upon the railway operated by such receiver or receivers."

I have undertaken to compile a statement as to the present condition of the law, or the interpretation which has been made of the law in regard to the liability of the employer, particularly for acts done by a fellow-servant, also by defective appliances. I spent a good deal of time in investigating this subject, and I am very glad to furnish the Commission with the following statement:

AUTHORITIES UPON THE LAW OF DAMAGES CAUSED FROM INJURIES RECEIVED (1) BY NEGLIGENCE OF A FELLOW-SERVANT AND (2) BY DEFECTIVE APPLIANCES.

1. *The negligence of a fellow-servant.*—To constitute fellow-laborers within the meaning of the doctrine which protects the master from responsibility for injuries sustained by one servant through the wrongful act or carelessness of another, it

is not necessary that the servant causing and the servant sustaining the injury shall both be engaged in precisely the same, or even similar acts, nor need their work be the same. The negligent servant may be superior to the injured servant, in his grade of employment. (*Bartonshill Coal Co. v. Reid*, 3 Macq., 295; *Blake v. Me. Cent. R. Co.*, 67 Me., 60; *Lawley v. A. R. R. Co.*, 62 Me., 463; *Albro v. Agawam Can. Co.*, 6 Cush., 75; *Thayer v. St. L. A., etc., R. Co.*, 22 Ind., 26; *Hoinagle v. N. Y. C. and H. R. Co.*, 55 N. Y., 608; *Malone v. Hathaway*, 64 N. Y., 5; *Peterson v. Whitebreast C. and M. Co.*, 5 Iowa, 673; *McLean v. Blue Point Gravel M. Co.*, 51 Cal., 255; *Collier v. Steinhart*, 51 Cal., 116; *O'Connor v. Roberts*, 120 Mass., 227; *Zeigler v. Day*, 123 Mass., 152; *Shanck v. N. C. R. Co.*, 25 Md., 462; *Brown v. Maxwell*, 6 Hill, 592.)

A common laborer conveyed to and from his labor by the railroad company employing him is a coemployee of those who have charge of the train conveying him. (*Kan. Pac. R. Co. v. Salmon*, 11 Kan., 83; *Gillshannon v. Stony Brook R. Co.*, 10 Cush., 298; *Seaver v. B. and M. R. Co.*, 14 Gray, 466; *Tunney v. Midland R. Co.*, 1 L. R. C. P., 291; *Russell v. Hudson R. Co.*, 17 N. Y., 134.)

A fellow-servant is anyone who serves and is controlled by the same master. Common employment is service of such kind that, in the exercise of ordinary sagacity, all who engage in it may be able to foresee when accepting it that, through the carelessness of fellow-servants, it may probably expose them to injury. (*McAndrews v. Burns*, 30 N. J. L., 117.)

A proper test is, whether the negligence of one servant was likely to inflict injury on another. (*Valtez v. O. and M. R. Co.*, 85 Ill., 500; *C. and A. R. Co. v. Murphy*, 53 Ill., 336.)

In Illinois it is held that when servants are not associated together in the discharge of their duties, where their employment does not require cooperation, and does not result in mutual contact or bring them together in such relation that they may exercise upon each other an influence promotive of safety or caution, the reason of the rule making those in different departments coemployees does not apply. (*C. and N. W. R. Co. v. Severt*, 45 Ill., 197; *Ryan v. C. and N. W. R. Co.*, 60 Ill., 171; *T. W. and W. R. Co. v. O'Connor*, 77 Ill., 391; *C. and N. W. R. Co. v. Moranda*, 93 Ill., 302.)

A carpenter working as such for a railway company, while being conveyed to or from his work, is not a fellow-servant of the employees running the train or repairing the track. (*O'Donnell v. Allegheny V. R. Co.*, 59 Pa. St., 239.)

A conductor being conveyed on his employers' railroad, under instructions to proceed to a certain point and there take charge of a train, is a fellow-servant of those who have the management of the cars in which he is riding. (*Manville v. C. and T. R. Co.*, 11 Ohio St., 417.)

If the parties are subject to the same general control and the employment is a common one, they are coemployees, although engaged in separate and distinct departments of the service. (*Ohio and M. R. Co. v. Hammersley*, 28 Ind., 371; *Col. and Ind. Cent. R. Co. v. Arnold*, 31 Ind., 174; *Slattery v. T. and W. R. Co.*, 23 Ind., 81; *Whaalan v. M. R. and L. E. R. Co.*, 8 Ohio St., 249; *Ry. Co. v. Lewis*, 33 Oh. St., 196; *Hodgkins v. Eastern R. Co.*, 119 Mass., 419; *Foster v. Minn. Cent. R. Co.*, 14 Minn., 360; *Coon v. Syracuse and U. R. Co.*, 5 N. Y., 492; *Banlee v. N. Y. and H. R. Co.*, 59 N. Y., 356; *Sammon v. N. Y. and H. R. Co.*, 63 N. Y., 251; *Kielley v. Belcher S. M. Co.*, 3 Samy., 500; *Cooper v. M. and P. D. C. R. Co.*, 23 Wis., 668; *C. and A. R. Co. v. Murphy*, 53 Ill., 336; *St. L. and S. E. R. Co. v. Britz*, 72 Ill., 256.)

Where one railway company runs trains on the track of another the servants of either company are not coemployees of the servants of the other. (*Smith v. N. Y. and H. R. Co.*, 19 N. Y., 127; *Carroll v. M. V. R. Co.*, 13 Minn., 30; *N. and C. R. Co. v. Carroll*, 6 Heisk., 347; *Sawyer v. R. and B. R. Co.*, 27 Vt., 370; *C. and R. Co. v. Armstrong*, 49 Pa. St., 186.)

Servants of subcontractor building bridges on line of railway are not coemployees of those operating the road and managing trains. (*Donaldson v. Miss. and Mo. R. Co.*, 18 Iowa, 280.)

Servants of a contractor and those of a subcontractor are not coemployees. (*Goodfellow v. B. H. and E. R. Co.*, 106 Mass., 461; *Corley v. Harris*, 11 Allen, 113; *Abrahams v. Reynolds*, 5 H. and N., 142; *Murphy v. Corolli*, 3 H. and C., 462; *Riley v. State L. S. S. Co.*, 29 La. Am., 791; *Svenson v. S. S. Co.*, 57 N. Y., 108; *Young v. N. Y. C. R. Co.*, 30 Barb., 229; *Murray v. Currie*, 6 L. R. C. P., 24; *Hunt v. Pa. R. Co.*, 51 Pa. St., 475; *Hass v. Phila. and S. M. S. Co.*, 88 Pa. St., 269.)

Engineers and brakemen are in the same class or line of employment and fellow-servants. (*L. and N. R. Co. v. Robinson*, 4 Bush, 507; *Sherman v. Roch. and S. R. Co.*, 17 N. Y., 153.)

So are a brakeman and a switch tender. (*Slattery v. T. and W. R. Co.*, 23 Ind., 81.)

So are a car repairer and an engine driver having charge of a switch engine. (C. and A. R. Co. v. Murphy, 53 Ill., 336.)

So are laborers on a construction train and the conductor of the same having charge of them. (C. and A. R. Co. v. Keefe, 47 Ill., 108.)

So is a person employed to couple cars and the engineer and conductor having charge of them. (Wilson v. Madison, etc., R. Co., 18 Ind., 226.)

So are the engineer of a general train and the hands employed in loading and unloading. (Ohio and Miss. R. Co. v. Tindall, 13 Ind., 366; *contra*, Dobbin v. R. and D. R. Co., 81 N. C., 446.)

So are the master machinist having charge of the machinery and control of the engineers and firemen on the railroad. (Fort v. M. Pac. R. Co., 2 Dill., 259.)

So are a trackman to follow passenger trains in a hand car and see that the track is in order and the managers of the train. (Coon v. S. and V. R. Co., 5 N. Y., 492.)

So are those running a passenger train and a laborer employed to gravel new and unfinished track. (Boldt v. N. Y. C. and H. R. R. Co., 18 N. Y., 432.)

Unless they are subject to the same general control, the fact that they are engaged in the same common pursuit does not make them coservants. (Svenson v. S. S. Co., 57 N. Y., 108; Abrahams v. Reynolds, 5 H. and N., 142.)

An express agent in the employ of an express company is not a coemployee of the train hands on the train on which he travels. (Yeomans v. C. C. S. Nav. Co., 44 Cal., 71.)

At common law, the employer is not liable for damages for injuries caused to an employee by his fellow-servant. Statutes of States seek to define what is a fellow-servant and to limit the class. Thus, at common law, the engineer and fireman of a locomotive engine are fellow-servants, and their common employer, the railroad company, is not liable to either for the negligence of the other.

So, at common law, a car inspector is a fellow-servant with a freight brakeman and therefore the common employer is not liable to the brakeman for the negligent act of the inspector. (See Reno on "Employer's liability acts," p. 113.)

Recovery from injuries from negligence of coservants is only precluded as against the common employer; the rule does not apply as to strangers. (Busch v. Buffalo C. R. Co., 29 Hun., 112.)

Where the owners of two steamboats agree to divide profits at the end of the season they are partners, but the crew of either boat are not fellow-servants of the crew of the other. (Connolly v. Davidson, 15 Minn., 519.)

Roadmaster having charge of repairs to a culvert is a coservant with the workmen repairing same. (Lawley v. Androscoggin R. Co., 62 Me., 463.)

A train hand is not a fellow-servant of a person who was engineer, conductor, superintendent, and master of a gravel and material train, and had entire charge of that branch of the business on a section, with power to employ and discharge men. (Dobbin v. R. and D. R. Co., 81 N. C., 446.)

When the servant, by whose negligence other servants of the common employer have received injury, is the alter ego of the master and to whom everything has been left, his negligence is the negligence of the employer, for which the latter is liable. (Malone v. Hathaway, 64 N. Y., 5; Corcoran v. Holbrook, 59 N. Y., 517; Murphy v. Smith, 19 C. B. N. S., 361; Laving v. N. Y. C. and H. R. R. Co., 49 N. Y., 521; Siegel v. Schantz, 2 T. and C. (U. Y.), 353; Wright v. N. Y. C. R. Co., 28 Barb., 80; Flike v. B. and A. R. Co., 53 N. Y., 551; Brothers v. Carter, 52 Mo., 373; Allen v. New Gas Co., 1 L. R. Ex. D., 251; Grizzle v. Frost, 3 F. and F., 622; Munson v. Oriental Pr. Wks., 11 B. L., 187; Brickner v. R. R. Co., 46 N. Y., 672; Brabbits v. R. R. Co., 38 Wis., 289; Tarlant v. Webb, 18 C. B., 797; Ford v. Fitchburg R. Co., 110 Mass., 240; Kelly v. Norcross, 121 Mass., 508; also see Hough v. Tex. and Pac. R. Co., 100 U. S., 213; especially note in Law Ed., 612.)

An engineer on one train is a fellow-servant of a conductor of another train on the same road. (Onakes v. Mase, 165 U. S., 363.)

A conductor and hands on a work train and a section foreman in charge of a hand car are fellow-servants of a laborer on the hand car under the orders of such foreman when, through their negligence, he is injured by a collision of the train with the hand car. (Martin v. A. T. and S. F. R. Co., 166 U. S., 339.)

A railroad company is not required to adopt extraordinary tests for discovering defects in a locomotive boiler or any of its machinery, and the burden of proof is on an employee to show that the injury received was caused by the master's negligence. (Tex. and Pac. Ry. Co. v. Barrett, 166 U. S., 617.)

A master is responsible to servant for carelessness and competency of coservants. (Neb. Ry. Co. v. McDaniels, 107 U. S., 454; 27 Law Ed., 605; note to Baugh case, 37 Law Ed., 773.)

A brakeman on a regular train of a railroad and the conductor of a wild train on the same road are fellow-servants, and the railroad company is not responsible

for injuries happening to the former by reason of a collision of the two trains. (Mo. Pac. R. R. Co. v. Poirier, 167 U. S., 48.)

The law of Kansas making a railroad company liable to an employee for the negligence or mismanagement of other employees of the same company is not in conflict with the fourteenth amendment to the Constitution. (Mo. Pac. Ry. Co. v. Mackey, 127 U. S., 205.)

The courts have declared the following fellow-servants:

A freight-train engineer and a yard clerk. (N. Y. and N. E. R. Co. v. Hyde, 56 Fed. Rep., 188.)

One who takes the number of each car and locomotive engineer. (Beuhring v. C. and O. R. Co., 37 W. Va., 502.)

A railroad fireman of one train and the engineer and fireman of another train. (Cole v. No. Cent. R. Co., 12 Pa. Co. Ct., 573; Enright v. T., A. A. and N. M. R. Co., 93 Mich., 409.)

A common day laborer and brakeman and engineer. (Mo. Pac. R. Co. v. Hawbly, 154 U. S., 349; 38 Law Ed., 1009, and many cases cited in footnote.)

A railroad engineer is not a fellow-servant of one who is in the exclusive employ of a coal company. (Cent. R. of N. J. v. Stoermer, 51 Fed. Rep., 518.)

A gripman on a cable car and the crew of a wrecking train are not fellow-servants. (West Chicago S. R. Co. v. Dwyer, 57 Ill. App., 440.)

Some more cases as to who are fellow-servants are collected in a footnote to Cent. R. R. Co. v. Keegan, 160 U. S., 259; 40 Law Ed., 418. Also footnote to B. and O. R. Co. v. Baugh, 37 Law Ed., p. 773.)

The engineer and fireman of a locomotive running alone and without any train attached are fellow-servants of the railroad company. (B. and O. R. Co. v. Baugh, 149 U. S., 368. See extensive notes on Iowa and Miss. employee's liability act in 9 Am. and Eng. R. Cas. (U. S.), 9 and 97.)

Damages received by a laborer in a roundhouse through the negligence of an engineer in blowing down the engine can not be recovered under the Massachusetts statute. (Perry v. Old Colony R. R. Co., 41 N. E. Rep., 289.)

A car cleaner engaged inside a passenger coach on a side track; another coach was kicked against it at an unusual rate of speed by a switching crew; damages awarded for injury done to such car cleaner. (Mitchell v. N. P. R. R. Co., 70 Fed. Rep., 15.)

The constitutional provision of Mississippi abrogating assumption of risk theory does not license recklessness or carelessness by the employees and give them a claim to compensation for injuries thus suffered. (Buckner v. R. and D. R. R. Co., 18 So. Rep., 449.)

A car repairer working in a separate yard from a "hostler" is not a fellow-servant of such hostler, nor of the switchman in such other yard, particularly while on a car under orders to proceed to another place and assist in repairing damages caused by a wreck. (San Antonio and A. P. Ry. Co. v. Keller, 32 S. W. Rep., 847.)

A wiper in a roundhouse who was injured while assisting in coaling an engine by its being negligently removed by a co-employee can recover damages, and the receiver of the railway company is within the provisions of the Minnesota "fellow-servant act." (Mikkelsen v. Truesdale, 65 N. W. Rep., 260.)

Both the conductor and engineer of a train are the superiors of a brakeman on the same train, and the railroad company is liable for injuries sustained by such brakeman in a collision caused by the negligence of the conductor in running his train in a depot yard at night without a sufficient headlight. (Crisswell v. Montana Central Ry. Co., 42 Pac. Rep., 767.)

A hostler, whose duty it is to bring the engines into the roundhouse and take them out when necessary, and a boiler washer, whose duty it is to clean the boilers of the engine so as to fit them for further service, are, as a matter of law, fellow-servants. (M. K. and T. Ry. Co. v. Whittaker, 33 S. W. Rep., 716.)

The employer's act of Alabama makes a carrier liable for negligence of co-employees, without reference to the care and diligence used by the carrier in the selection of its employees. (Culver v. Ala. Md. Ry. Co., 18 Sou. Rep., 837.)

A carrier is liable in damages for death of an engineer who was killed in a collision caused by his engine running into an unlighted switching engine moving around in the yards. (San Ant. and A. P. R. R. Co. v. Harding, 33 S. W. Rep., 373.)

A brakeman of a railway company was injured by the negligence of his foreman; held that the carrier was not responsible, as the brakeman and the foreman of the drill crew, of which the brakeman was a member, are fellow-servants. (Cent. R. R. Co. v. Keegan, 16 Sup. Ct. Rep., 269.)

An engineer directed a brakeman to put on the brake, and it was the duty of the deceased to obey such direction, upon which the train was wrecked and

brakeman killed. The engineer and brakeman are not fellow-servants and the carrier is liable. (Tex. Cent. Ry. Co. v. Frazier, 34 S. W. Rep., 664; 36 ib. 432.)

A switch engineer who had no authority or control over a switchman, but who belonged to the same crew, by negligence causes an injury to the switchman. The carrier is not liable as these employees were fellow-servants. (Gulf, C. and S. F. Ry. Co., v. Warner, 35 S. W. Rep., 364.) In this decision the court defined fellow servants to be: Employees who are engaged in a common service, in the same grade of employment, working together at the same time and place, and working to a common purpose.

The master's liability does not depend upon gradations in the employment. The test is, the servant must be employed in different departments, which in themselves are so distinct and separate as to preclude the probability of contact and of danger of injury by the negligent performance of the duties of the servant in the other department. (Sou. Pac. Co. v. McGill, 44 Pac. Rep., 302.)

The master owes a servant entering his employment the duty to provide a reasonably safe place to work in, to provide reasonably safe tools, appliances, and machinery, to employ safe and competent co-servants, and to adopt and promulgate safe and proper rules for the conduct of the business. (North. Pac. R. R. Co. v. Peterson, 16 Sup. Court Rep., 843.) In this case the Supreme Court of the United States held that a day laborer on an extra gang on a hand car and a foreman of the gang are fellow-servants.

For using in a negligent manner a defective appliance furnished by the master the latter might be liable if a coemployee were thereby and in consequence thereof injured. As the master furnished the defective appliance it would be no answer to say that it was negligently used. But, on the other hand, the master would not be responsible for the negligent use of a proper appliance. (North. Pac. R. R. Co., v. Charles, 16 Sup. Ct. Rep., 849.)

The fellow-servant act of Texas does not apply to street railroads, as they are not "railroad corporations." (Riley v. Galv. City Ry. Co., 35 S. W. Rep., 826.)

A superintendent of a convict camp and a convict are not fellow-servants, as the convict's servitude was involuntary. (Buckalew v. Tenn. C. and I. Co., 20 Sn. Rep., 606.)

If the superintendent of a log company and vice-principal negligently and improperly directed the plaintiff to work on the log deck with him without giving him necessary or proper warning or instruction as to the danger and hazard of working there, for the lack of which he got injured, this must be regarded as the negligent act of the defendant, for which it would be liable. (Klochinski v. Sholes Lumber Co., 67 N. W. Rep., 934.)

A conductor directing and controlling the movements of a train is a vice-principal of the master, and not a fellow-servant of his brakeman. (Spencer v. Brooks, 25 S. E. Rep., 480.)

A carrier is liable for a defective ladder on a freight train because of which a freight conductor was injured, where by the use of ordinary care it could have been known that the ladder was in such condition. (Ill. Cent. R. R. Co. v. Hilliard, 37 S. W. Rep., 75.)

A train dispatcher is not a fellow-servant of trainmen in charge of a train; but a local telegraph operator at the station, who receives and delivers the orders of the train dispatcher is a fellow-servant of such trainmen. (Oreg. S. L. and U. N. Ry. Co. v. Frost, 74 Fed. Rep., 965.)

A motorman on an electric car and the track repairer in employ of the same corporation are fellow-servants. (Landquist v. Duluth St. Ry. Co., 67 N. W. Rep., 1006.)

A conductor of a train used in connection with a bridge gang is not a fellow servant of members of the bridge gang under the "fellow-servant act of Texas." (M. K. and T. Ry. Co. v. Hines, 40 S. W. Rep., 152.)

A boss directing an act in the execution of his duty merely as foreman of a gang and coemployee of the injured employee, is not liable for damages. (Maher v. Thropp, 35 Atl. Rep., 1057.)

The head of a gang of workmen who has charge of a particular department in the erection of a building is a fellow-servant with the workmen in his gang—following the Baugh Case. (Coulson v. Leonard, 77 Fed. Rep., 538.)

A shift boss in a mine is not a fellow-servant with a man under his employ. (McMahon v. Ida Mining Co., 70 N. W. Rep., 478.)

A master violates his duty and is guilty of culpable negligence whenever, without warning, he exposes his servant knowingly to a risk of injury which is not obvious and was not known to the servant. (Gorven v. Bosh, 76 Fed. Rep., 549.)

A conductor is a fellow-servant with a brakeman and other servants on a train, not a vice-principal. (Jackson v. N. and W. R. R. Co., 27 S. E. Rep., 278.)

An overseer of Government fortifications in personal charge of the work is not a fellow-servant with a laborer in his hire. (*Atkins v. Field*, 36 Atl. Rep., 375.)

A conductor and an engineer on a train are not fellow-servants under the fellow-servant act of Texas. (*Culpepper v. Int. and G. N. R. Co.*, 40 S. W. Rep., 386.)

"Common service" means the particular thing or work being performed for the employer, at the time of the accident, and out of which it grew, jointly, by the employees sought to be held fellow-servants. So, members of two different train gangs, attached to two different trains, are not in a "common service," and therefore are not fellow-servants. (*Patterson v. Houst. and Tex. C. R. R. Co.*, 40 S. W. Rep., 442.)

The fellow-servant act of Texas is constitutional. (*Mo., K. and Tex. Ry. Co. v. Hannig*, 41 S. W. Rep., 196.)

An employee of an American railway company on a train running from Vermont to a point in Canada is killed within the territory of Canada. The circuit court of appeals of the United States declared that his legal representatives could sue in the United States, but that the law of Canada making the carrier liable whether the injury was caused by negligence of a fellow-servant or not should be the law of the case. (*Boston and Me. R. R. Co. v. McDuffey*, 79 Fed. Rep., 934.)

A member of a gang doing the same work and receiving the same pay as other members of the gang, but who exercises authority over the gang, is still a fellow-servant. (*Moore Live Co. v. Richardson Adnex*, 28 S. E. Rep., 334; *Railway Co. v. Becker*, 39 S. W. Rep., 358; *Hunter v. K. C. and M. Ry. Co.*, 85 Fed. Rep., 379.)

Statutes of a State as to fellow-servants do not encroach upon Federal authority, and constitute the laws of the State which Federal courts are bound to administer in suits arising within the State. (*Hunter v. K. C. and M. Ry. and Br. Co.*, 85 Fed. Rep., 379; *C. M. and St. Paul Ry. Co. v. Solan*, 169 U. S., 133.)

A foreman of a section gang is not a fellow-servant of the men belonging to the gang under him, for the reason that they are under his control and direction in the performance of their duties. (*St. L., I. M. and S. Ry. Co. v. Rickman*, 45 S. W. Rep., 56.)

When an injury is caused partly by the negligence of a fellow-servant, and partly by the failure of the master to provide the servant a reasonably safe place at which to work, the negligence of the fellow-servant will not exonerate the master. (*Stucke v. Orleans R. R. Co.*, 23 Sm. Rep., 342.)

In this State (Illinois), in order that one servant should be the fellow-servant of another, their duties must be such as to bring them into habitual association, so that they may exercise a mutual influence upon each other promotive of proper caution. (*Edward Hines Lumber Co. v. Ligas*, 50 N. E. Rep., 225.)

It must be conceded that the courts have indulged in much refinement of reasoning on the question of who are fellow-servants, and that the grounds on which many decisions have been based on either side of the question are not altogether satisfactory. (*Walker v. Gillett*, 52 Pac. Rep., 442.)

A vice-principal for whose negligence an employee will be liable to other employees must be either—First, one in whom the employer has placed the entire charge of the business, or of a distinct branch of it, giving him not mere authority to superintend certain work or certain workmen, but control of the business, and exercising no discretion or oversight of his own; or, secondly, one to whom he delegates a duty of his own which is a direct, personal, and absolute obligation, from which nothing but performance can relieve him. (*Prevost v. Citizens' Ice and Refrigerating Co.*, 40 Atl. Rep., 88.)

In all the cases decided in Pennsylvania under the statute requiring operators of mines to employ mine bosses, it is held that these mine bosses are fellow-servants with the miners and employees in the mines. (*Williams v. Thacker C. and C. Co.*, 30 S. E. Rep. (W. Va.), 107.)

A winchman operating the engine and a member of a stevedore gang are not fellow-servants. (*The Lisnacrieve*, 87 Fed. Rep., 570.) But where the regular winchman is absent and a common laborer, like the libellant, was at the winch, then the temporary winchman is a fellow-servant with the stevedores. (*The Anaces*, 87 Fed. Rep., 565.)

2. *Defective appliances.*—A master is liable to his servant for injuries resulting from defects in machinery or appliances of which he might have known by the exercise of ordinary care. (*Bier v. Standard Mfg. Co.*, 130 Pa., 446; *East St. Louis Pach and P. Co. v. McElroy*, 29 Ill. App., 504; *Union Pac. R. Co. v. Fray*, 43 Kans., 750; *Dutzi v. Geisel*, 23 Mo. App., 676; *Donaline v. Enterprise R. Co.*, 32 S. C., 209; *Washington and G. R. Co. v. McDade*, 135 U. S., 554 (34, 235), 18 Wash. L. Rep., 526; *Southwest Virginia Imp. Co. v. Andrew*, 13 Va. L. J., 634, 17 Wash. L. Rep., 599; *Humphreys v. Newport News and M. V. Co.*, 33 W. Va., 135, 39 Am. and Eng. R. Cas., 363; *Hoffman v. Dickinson*, 31 W. Va., 142; *Kaspari v. Marsh*, 74 Wis., 562.)

An employer does his duty when he provides in such manner as is fairly and reasonably prudent and safe, and when he furnishes appliances which, although not the best that can be obtained, may be used without danger. (*McCombs v. Pittsburgh and W. R. Co.*, 130 Pa., 183; *Ballard v. Hitchcock Mfg. Co.*, 51 Hun, 188; *Kaye v. Rob Roy Hosiery Co.*, 51 Hun, 519; *Lehigh and W. Coal Co. v. Hages*, 5 L. R. A., 441, 128 Pa., 294; *Carlson v. Phenix Bridge Co.*, 55 Hun, 485; *Galveston, H. and S. A. R. Co. v. Garrett*, 73 Tex., 262.)

An employee is warranted in acting upon the assumption that machinery which he is required to use is safe and adapted to the service in which he and it are employed. (*Galveston, H. and S. A. R. Co. v. Garrett*, 73 Tex., 262; *Covey v. Hannibal and St. J. R. Co.*, 27 Mo. App., 170; *Bowers v. Union Pac. R. Co.*, 4 Utah, 215.)

It is the duty of the master to use reasonable diligence to guard against the risk of accident to his employees, and to make such reasonable repairs or changes as may be necessary to remove such risk. (*McDonald v. Chicago, St. P., M. and O. R. Co.*, 41 Minn., 439.)

A servant can not recover for an injury resulting from defective machinery or appliances unless the master knew, or ought to have known, of the defect and the servant was ignorant thereof and had not equal means of knowledge. (*Humphreys v. Newport News and M. V. Co.*, 33 W. Va., 135; *Bailey v. Rome, W. and O. R. Co.*, 49 Hun, 377; *Chicago and A. R. Co. v. Stites*, 20 Ill. App., 648; *Washington and G. R. Co. v. McDade*, 135 U. S., 531 (34-235), 18 Wash. L. Rep., 526; *Goltz v. Milwaukee, L. S. and W. R. Co.*, 76 Wis., 136, 41 Am. and Eng. R. Cas., 282.)

It is the duty of a railroad company to inspect the cars of another company used upon its road and see that they are in proper condition so as to be safe for the use of employees. (*Goodrich v. New York Cent. and H. R. R.*, 5 L. R. A., 750; 116 N. Y., 398; 41 Am. and Eng. R. Cas., 259.)

It is the duty of a railroad company in employing a brakeman to provide its cars with safe and suitable brakes and appliances to be used by him. (*Carpenter v. Mexican Nat. R. Co.*, 17 Wash. L. Rep., 630; 39 Fed. Rep., 315.)

A railroad company owes an employee the duty of keeping in a reasonable safe and secure condition a stage or platform constructed for the use of men engaged in unloading coal cars standing on a trestle. (*Sellbrok v. Langdon*, 55 Hun, 19.)

Injury to a brakeman from collision of the train with an animal which has come upon the railroad track through a defective fence makes the company liable for the damages under the New York general railroad act of 1850, section 44, which imposes upon railroad companies the absolute duty to fence their tracks. (*Donnegan v. Erhardt*, 7 L. R. A., 527; 119 N. Y., 468; 42 Am. and Eng. R. Cas., 580.)

It is the duty of the master to provide his servants with a safe working place and with safe machinery and appliances and to keep them in repair. (*Indianapolis and St. L. R. Co. v. Watson*, 114 Ind., 20; *Cullen v. National Metal Roof Co.*, 46 Hun, 562; *Rice v. King Phillip Mills*, 141 Mass., 229; *Atchison, T. and S. F. R. Co. v. McKee*, 37 Kan., 592; *Thorn v. New York City Ice Co.*, 46 Hun, 497; *Nelson v. Allen Paper Car Wheel Co.*, 29 Fed. Rep., 840.)

A railroad company is under a legal duty not to expose its employees to dangers arising from such defects in foreign cars as may be discovered by reasonable inspection before such cars are admitted into its trains. (*Balt. and P. R. Co. v. Mackey*, 157 U. S., 72.)

A railroad company which fails to have modern coupling devices on its freight cars is guilty of continuing negligence and is liable for injuries incurred in coupling such cars by hand. (*Greenlee v. Southern Ry. Co.* (N. C.), 30 S. E., 115.)

Railroads, though not bound to their servants to supply them with the best of everything in the way of machinery and appliances, are bound to furnish such as are being used by well-regulated and conducted railroads, well constructed, and kept in repair. (*Toledo, W. and W. R. Co. v. Fredericks*, 71 Ill., 294; *Mansfield Coal and C. R. Co. v. McEnery*, 91 Pa., 185; 36 Am. Rep., 662; *Cooper v. Central R. Co., of Iowa*, 44 Iowa, 134; *Brown v. Accrington Cotton Spinning and Mfg. Co.*, 3 Hurlst. and C., 511; *McGinnis v. Canada Southern Bridge Co.*, 49 Mich., 406; *Little Rock and Ft. S. R. Co. v. Duffey*, 35 Ark., 602; *Toledo, W. and W. R. Co. v. Asbury*, 84 Ill., 429; *King v. Boston and W. R. Corp.*, 9 Cnsh., 112; *Cagny v. Hannibal and St. J. R. Co.*, 69 Mo., 416; *Disher v. New York Cent. and H. R. R. Co.*, 94 N. Y., 622.)

A railroad company is liable for an injury to an employee from a defective side stake on a lumber car. (*Bushby v. New York, L. E. and W. R. Co.*, 107 N. Y., 374.)

A railroad company is liable for negligence in not providing and keeping a ladder on a freight car next to a caboose in good repair, so as to make it safe for the conductor to pass up and down it in the discharge of his duties, where he is not chargeable with negligence in using it. (*Goodman v. Richmond and D. R. Co.*, 81 Va., 576.)

An employer is not liable for injuries caused by defects in machinery, if they could not be known or be supposed to exist, after the exercise of ordinary care, skill, and diligence. (*Gulf C. and S. P. R. Co. v. Wells*, 81 Tex., 685.)

An employer is not required to furnish his employee with such appliances as combine the greatest safety with practical use, but only to exercise such care in their selection as a prudent man would exercise for his own protection. (*Sappenfield v. Main Street and A. P. R. Co.*, 91 Cal., 48; *Brymer v. Southern Pac. Co.*, 90 Cal., 496.)

A railway company is bound to use a high degree of care in furnishing and keeping in repair machinery which its servants are required to use; but is not bound to furnish machinery that is absolutely safe. (*International and G. N. R. Co. v. Williams*, 82 Tex., 342.)

The use of an appliance or machine which has been in daily use for a long time, and has uniformly proved safe and efficient may be continued without imputation of negligence. (*Sappenfield v. Main Street and A. P. R. Co.*, 91 Cal., 48; *Brymer v. So. Pac. Co.*, 90 Cal., 496.)

For the above and many other similar authorities on this point, see note to *Richmond and Danville Railroad Company v. Elliott* (149 U. S., 266) in 37 Law Edition (U. S. Rep.), page 728.

As to liability of railroad companies to switchmen or brakemen for injuries while coupling cars, see note to *Kohn v. McNulta* (37 Law Ed., p. 150).

While it is true that a servant who enters the employment of another assumes the ordinary risks of business, this would not include the risks of working with unsafe appliances; for the master is bound to supply his servants with sound and safe appliances, and to keep the same in sound and safe condition. (*Bussey v. Char. and W. C. Ry. Co.*, 30 S. E., 477.)

The duty of a railway company toward an employee, to inspect cars coming from other roads, is not limited to cars which are to be hauled over its own road, but extends to cars which it switches from another road, to which they are to be returned after loading.

An employee of a railway company has the right to rest on the assumption that appliances furnished are free from defects discoverable by proper inspection, and is not submitted to the danger of using appliances containing such defects because of his knowledge of the general methods adopted by the employer in carrying on his business, or because, by ordinary care, he might have known of the methods, and inferred therefrom that danger of insufficient appliances might arise. (*Tex. and Pac. R. Co. v. Archibald*, 170 U. S., 665.)

The failure to provide the necessary appliances is the *causa caucaus*. The defendant, however, frankly asks us to reconsider and overrule the *Greenlee* case. That case was the expression of no new doctrine, but the affirmation of one as old as the law, and founded on the soundest principles of justice and reason, to wit: That when safer appliances have been invented, tested, and have come into general use, it is negligence per se for the master to expose his servant to the hazard of life or limb from antiquated appliances which have been generally discarded by the intelligence and humanity of other employers. (*Witsell v. R. R. Co.*, 120 N. C., 557.) This must be so if masters owe any duties to their employees and unless economy of expenditures on the part of the railroad management is to be deemed superior to the conservation of the lives and limbs of those employed in their operation. The court refused to overrule the *Greenlee* decision.

The defendant was bound to exercise reasonable care in providing suitable machinery, instruments, means, and appliances for its work. The providing of suitable links for coupling the cars of the train fell within this duty. This was a duty which belonged to the defendant as master, and could not be delegated. It should use proper care to furnish secure and proper masters over any duties to their employees; and unless economy of expenditures on the part of the railroad management is to be deemed superior to the conservation of the lives and limbs of those employed in their operation. The court refused to overrule the *Greenlee* decision. (*Troxler v. Southern R. R. Co.*, N. C., March, 1899, not yet reported.)

The defendant was bound to exercise reasonable care in providing suitable machinery, instruments, means, and appliances for its work. The providing of suitable links for coupling the cars of that train fell within this duty. This was a duty which belonged to the defendant as master, and could not be delegated. It should use proper care to furnish secure and proper links and to keep them in such a condition that they should be proper and sufficient for work to be done by them. The defendant should use reasonable care to prevent the use of unsuitable and dangerous links. (Judge Blodgett's charge to the jury in *Miller v. N. Y., N. H. and H. R. R.*, superior court of Mass., October, 1898.)

NEGLECTANCE OF FELLOW-SERVANTS.

The great conflict of authority respecting the rule as to when two employees are fellow-servants has caused various States of the Union to pass acts upon the subject. The proposed object of such acts is, generally, to correct either a previous bad statement or a previous bad judicial decision. Alabama, Massachusetts, Colorado, Indiana, and other States have passed employer's liability acts based upon the English act of 1880. In the case of railroad employees, these acts give the employees a right of action against their employers for injuries caused by reason of the negligence of any person having charge or control of certain railroad instrumentalities.

In some States the defense of fellow-servant's negligence has even been abolished in certain cases by statute; other States have no legislation upon the subject; and the United States Supreme Court has decided in the *Baugh* case, "against the trend of some former cases," as Judge Acheson says, that in the absence of State legislation the question is not one of local law upon which the Federal courts are bound to follow the State decisions, but is one of general law upon which the Federal courts may exercise their independent judgment, uncontrolled by local decisions. Thus appears the anomalous condition of suits for damages in a State, based upon the same facts, which are governed by different principles of law, dependent upon whether the suits are brought in the courts of the State or in the courts of the United States. There is great need of legislation by Congress upon this point. A uniformity is very much to be desired in the legal principles governing such cases.

Again: A Federal court which sits in one State may enforce the statute of another State, where the injury occurred, although the local State courts of the State wherein the Federal court sits have refused to enforce such statute. Even a decision by a State court that no action can be maintained under a statute of another State is not binding upon a Federal court sitting in the first State in another like case: *Cox Case* (145 U. S., 593). There the "general law" doctrine also intervened and overrode the local statute. New legislation is necessary along this line, too, in order to clear up such conflict and confusion and to establish a uniform mode of procedure in all the Federal courts.

"The stubborn resistance of business corporations," said Mr. Thomas G. Shearman, an attorney of the New York bar who has repeatedly represented railway companies and other corporations, "common carriers and mill owners to the enforcement of the most moderate laws for the protection of human beings from injury, and their utter failure to provide such protection of their own accord, ought to satisfy any impartial judge that true justice demands a constant expansion of the law in the direction of increased responsibility for negligence, instead of attempts, unfortunately too common, to restrict such responsibility by introducing new exceptions."

DEFECTIVE APPLIANCES.

The weight of authorities establishes that a carrier is bound to the exercise of reasonable care with reference to all the appliances of its business, and is bound to protect its employees from injury therefrom by reason of latent or unseen defects so far as such care can do so; but the carrier is not an insurer to its employees against injury, and is only chargeable for damages happening to its employees from defective appliances when negligence can properly be imputed to the carrier.

I believe that an investigation by this commission will show that the time has come when the Congress of the United States should declare itself in regard to these unsettled questions which are being so differently determined by different courts, and for which there exists no fixed rule of decision.

In England considerable progress has been made in that direction. The state of the law there, as I understand it, is as follows:

Under the old common law the employer was only liable in damages for injuries caused to anyone by the negligence of his servants, and then an exception was made when the person knowingly incurred the risk. The courts held, on the ground that a workman when he engaged himself in any service he was aware that in all employments the risk of injuries by the negligence of fellow-employees will be incurred, that an employer was not, therefore, liable to the workman for the injuries thus incurred. The first step to relieve the employee of this hardship was the employers' liability act of 1880. At the time of its passage business men all over the country predicted ruin to the employers, but during nearly two decades of operation the predictions have not been fulfilled, and

on the contrary it has been seen that the principle enunciated could be further invoked. A bill entitled the employers' liability act of 1893 was introduced in Parliament by Mr. Asquith, but it did not become a law. It was constructed along the lines of the act above mentioned, but in addition prohibited "contracting out." The workmen's compensation act of 1897, operative July 1, 1898, and introduced by Mr. Chamberlain, is a further evolution of the principle. It, too, practically prohibits "contracting out" and at the same time makes the employer virtually the insurer of the employee. Instead of the negative exposition, this new act declares the employer liable for all injuries and excepts those occasioned by the serious and willful misconduct of the employee. A schedule of compensations or damages for which the employer is variously liable is included in the act. These liabilities are so large that employers are compelled to resort to insurance companies, or for cheaper indemnity, to mutual combinations. Contrary to expectations the insurance companies have raised their charges very much, but it is conservatively hoped that the experience of a short period of time will prove the lack of necessity for such advances in rates.

This act, by fastening the liability upon the employers, makes a great stride toward the principle that the trades and industries in which an employee is engaged at the time of the injury should bear the burden of the relief and maintenance of the injured man and those dependent upon him.

Q. (By Mr. C. J. HARRIS.) Is there something about limit of liability in the English law?—A. The bill provides: "That where personal injury is caused to a workman by reason of the negligence of any person in the service of the workman's employer, the workman, or, in case of the injury resulting in death, his representatives, shall have the same right to compensation and remedies against the employer as if the workman had not been in the employer's service. An exception to this is made where the workman, knowing of the negligence, failed, without reasonable excuse, to notify employer, etc. A contract made before the accrual of the right is not a defense. The employer, however, in case he has contributed to a fund providing any benefit for the workman, when sued shall be entitled, in the place of the workman, to any money payable out of the fund. And if the employer is sued and payment of a fine, under any act of Parliament in respect to the same cause of action, has not been paid, the workman shall not be entitled thereafter to receive any such fine."

Q. Do you know, as a matter of fact, whether they have limited liability by legislation there?—A. To the extent I have stated.

The act of 1880 makes the employer liable for injuries to the workman caused by defect of machinery, negligence of a person in the employer's service intrusted with superintendence or with authority over the injured man, or any act or omission done or made in obedience to the orders or by-laws of the employer, or by the negligence of any person in charge of railway signals, etc., while the bill of 1893 would make the employer liable to the injured workman where the injury was caused by the negligence of any person in the service of the employer. Both place the workman in the same position as if he were not in the service of the employer. By the act of 1880 the employer was protected by exceptions in which he was morally innocent, while bill 118 excepts him only when the employee, knowing of the negligence, failed without reasonable excuse to notify the employer, etc. The bill adds, further, that a contract made before the accrual of the right is not a defense. On the other hand, by it the employer, when he has contributed to a fund providing any benefit to the workman and the employer is sued, he is entitled, in the place of the workman, to any money payable out of the fund. And if sued and payment of a fine under any act of Parliament in respect to the same cause of action has not been paid by the employer, the workman shall not be entitled thereafter to any such fine. Unlike the act, the bill does not limit the amount of damages recoverable, nor does it limit the time within which the action must be brought. Both provide that the action must lie in the county court, but can be carried into a higher court.

In some of our own States we have limited liability; that is, that a death claim can not exceed \$5,000. It is so in Massachusetts. Damages recoverable for death through negligence: \$5,000 in Colorado, Connecticut, Illinois, Massachusetts, Maine, Minnesota, Missouri, New Hampshire, New York, Oregon, Pennsylvania, Wisconsin, West Virginia—13; \$10,000 in District of Columbia, Ohio, and Virginia—3. Now, at least, the Congress should either do that or it should endeavor to secure harmony of decisions of State and Federal courts.

The case of Baltimore and Ohio Railroad against Baugh (United States Supreme Court Reports, vol. 149, p. 368) is a very peculiar case. I want to state something about it in an offhand way. Baugh was an employee on the Baltimore and Ohio Railroad; he was injured, and brought a suit in the State court. The Baltimore

and Ohio Railroad, on the ground that it was a foreign corporation, had this case removed to the United States circuit court. It was tried in the United States circuit court. The court followed the decisions of the State court and damages were awarded Baugh. The case then went to the Supreme Court of the United States on appeal from this decision—made by court of the carrier's own choosing—and the Supreme Court held that the railroad was not liable. Now, you see this curious state of affairs: Here are two parallel roads. If the Baltimore and Ohio had been a corporation of the State of Ohio his case would have been maintained in a State court, where undoubtedly he would have obtained redress; but here was a foreign corporation paralleling a State road, and Baugh was injured with impunity. The fact of being a foreign corporation deprived him of the protection of the laws of his State and he could not recover for his injury. The court said that "there is no common law in the United States, but there is a general law;" and that seems to mean that any particular case is judged by such construction as any particular judge may see fit to find, without precedent to guide him. Here you will find what some of the United States court judges have said in regard to the Baugh decision:

"Against the trend of some former cases." (Judge Acheson, in *Pull. P. Co. v. Harkins*, 55 Fed. Rep., 932.)

"As a United States circuit judge, it becomes my duty to conform to the view so strongly announced as is the utterance of the Supreme Court in the Baugh Case." (Judge Lurton, in *Harley v. L. and N. R. Co.*, 57 Fed. Rep., 144.)

"The Baugh and various other decisions may be characterized, at least, as conflicting." (Judge Ross, in *Bank of N. A. v. Rindge*, 57 Fed. Rep., 279.)

"The rule declared by the Supreme Court in the Baugh Case is claimed to be broader, more comprehensive, and far-reaching than any heretofore announced by that court." (Judge Woods, in *N. and N. R. Co. v. Ward*, 61 Fed. Rep., 927.)

"It is insisted that these and other cases," including the Baugh Case, "show the existence of some general law separate from and independent of the law of the land prescribed by the States. This does not, in my opinion, follow." (Judge Grosscup, in *Swift v. Phil. and R. R. Co.*, 64 Fed. Rep., 59.)

"The Ross Case, while left to stand upon ground apparently inconsistent with the general principles announced in the Baugh Case, is nevertheless, in terms, expressly approved in the opinion of the court in the latter case, and the principles upon which it rested are there carefully distinguished." (Judge Gilbert, in *No. Pac. R. Co. v. Beaton*, 64 Fed. Rep., 563.)

"Our decisions above referred to were each predicated on the rulings made in the Baugh Case, which set at rest some of the doubts that had been raised, and corrected certain deductions that seemed to be warranted by some expressions found in the earlier case of *Railway Co. v. Ross*." (Judge Thayer, in *Balch v. Haas*, 73 Fed. Rep., 974.)

"In *Finley v. Railroad Company* I attempted to distinguish the facts and principles involved in the case on trial from those presented in *Railroad Co. v. Baugh*, and follow the decision of the supreme court of this State in *Mason v. Railroad Company*. The circuit court of appeals overruled my views of the law of the case. I now feel constrained to strictly observe the positive decisions of the United States appellate courts, clearly expressed in learned and elaborate opinions." (Judge Dick, in *Wright v. So. Ry. Co.*, 80 Fed. Rep., 260.)

Here are a number of conflicting opinions—one judge says it is right and one judge says it is wrong; and if this commission can not come to the point where it feels that after a fair examination of this whole subject there ought to be a national law defining the liability of employers, at least it should recommend action such as is contemplated by the following proposed act:

"AN ACT to secure harmony in decisions of State and Federal courts.

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the decisions of the courts of last resort in the several States shall, except where the Constitution, treaties, or statutes of the United States otherwise require or provide, be regarded as rules of decision in trials at common law in the courts of the United States, in cases where such decisions apply, and no distinction in this regard shall be made between cases involving questions of general and those involving questions of special or local law."

It seems to me that, as the time has come when almost every case involving railway employees reaches the courts of the United States, Congress can well enact legislation in regard to that class which the courts must follow.

Q. (By Mr. PHILLIPS.) Who suggested that law?—A. I wrote it.

Q. (By Mr. KENNEDY.) Do the State courts accept the decisions of Federal courts as higher than their own?—A. No, I think not; but the Federal court is presumed, where the statute of any particular State is in question, to follow the

statute of that State and the decisions of the courts, as far as applicable to the case at issue. I have also here a bill which was introduced at my request by Mr. McEtrick, of Boston, in the Fifty-third Congress. I hardly expected that any legislation could there be accomplished, but I believed that time would bring the question to the front. The bill was prepared with the greatest care, and is in line with the English bill of 1893 regarding the same subject. The bill is as follows:

"A BILL relating to the liability of employers engaged in interstate and foreign commerce for injuries to their employees.

"*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the provisions of this act shall be held to apply only to common carriers engaged in interstate and foreign commerce and to their employees engaged in the service of such common carriers as such.

"SEC. 2. That where, after the enactment of this act, personal injury is caused to an employee by reason of the negligence of any person in the service of the employee's employer, the employee, or, in case of his death, his representatives, shall have the same rights to compensation and remedies against the employer as if the employee had not been an employee of, nor in the service of, the employer, nor engaged in his work: *Provided,* That an employee or his representatives shall not be entitled under this act to any right of compensation or remedy against the employee's employer in any case where the employee knew of the negligence which caused his injury and failed, without reasonable excuse, to give or cause to be given within a reasonable time information thereof to his employer, or to some person superior to himself in the service of his employer; but nothing contained in this proviso shall apply to any case where such employee is injured contrary to the provisions of the act to promote the safety of employees, and so forth, approved March second, eighteen hundred and ninety-three.

"SEC. 3. That a contract whereby an employee relinquishes any right under this act shall not, if made before the accrual of the right, constitute a defense to any action brought for the recovery of compensation under this act.

"SEC. 4. That where an employer has contributed to a fund providing any benefit for an employee, or his representatives in case of injury or death, then, in the event of the employee or his representatives neglecting to sue the employer for compensation, instead of claiming against the fund, the employer may be released from legal liability to the amount of the proportion of the benefit arising from the employer's contribution to such fund."

The act referred to in section 2 of the bill just read is properly known as the "Coupler bill" or "Safety appliance act," which in section 8 provides that it can not be urged in defense by the railroad company that an injured employee knew of the failure to provide the appliances which this law requires and continued in service, and did not call the attention of his employer to the matter.

Q. Have some States adopted laws similar to that proposed by you?—A. Yes, indeed. The States to a greater or less extent are doing so. Every session, I might say, increases the number, and this is well, for it supplements what Congress has done.

(Mr. Moseley here read section 3 of the bill mentioned.)

This is to prevent an employer from forcing an employee to sign an agreement releasing him from claim for damages by reason of the negligence of the employer.

(Mr. Moseley here read section 4 of the bill mentioned.)

And I would state in explanation of it that the Baltimore and Ohio Railroad and other railroads—the Chicago, Burlington and Quincy Railroad, etc.—have what is called a relief fund, and every employee was required to contribute a certain amount of his earnings to the fund.

Q. Required by whom?—A. By the employer, who also contributes to the fund.

Q. (By Mr. FARQUHAR.) Is that contribution on the part of the employees perfectly voluntary?—A. Hardly, sir; it was virtually a condition of employment. It is voluntary in name; but if a man does not see fit to contribute, the road will probably find somebody better fitted to hold his position than himself.

Q. Has there not been a decision of the Illinois courts in regard to that within a year?—A. Yes, sir; so I understand. I have forgotten for the moment. This requirement is a condition of employment by some roads, and it had reached a point which it was believed called for action. Congress recognized this, as you will see by referring to section 10 of the "Act concerning carriers engaged in interstate commerce and their employees."

The employers' liability bill was introduced prior to the passage of the bill I have just mentioned, and very properly provided that only to the extent to which a man has contributed to a fund shall it be used as an offset against any claim which he rightly has for damages.

Q. (By Mr. KENNEDY.) Are railroad relief societies considered by employees as in some instances used to take away their allegiance from their unions and to put it where their money is?—A. That is a matter I will try to explain. Before the statute was enacted it became so onerous to the men that a desire was expressed to provide for it in what is called their bill—arbitration bill. Congress responded to this and made it law that it should not be made a condition of employment or a condition of remaining in employment to contribute to any fund, etc., and since the passage of that law, June 1, 1898, I do not think that any railroad has endeavored to force their men in the slightest way in this respect.

Q. (By Mr. C. J. HARRIS.) In view of the decisions of the courts, will it be advisable to attempt liability legislation in this country to cover this whole ground?—A. Limited as to the amount recoverable? You do not mean that if a man is killed, whether it is his own fault or not, then he gets so much? That is the case now, I believe, in Germany.

Q. Is that class of legislation being passed by foreign countries?—A. Yes, sir; particularly in Germany.

Q. What would be the effect here of such legislation?—A. This is a question of such importance that I can not properly answer it offhand. As a matter of present impression, I believe it would not be fair to go to that extent. Let men understand they owe some care and caution when engaged in their work not only to themselves, but to their employers. If a man is killed by his own negligence, purely as a matter of risk of his employment, he has been receiving increased compensation, or is presumed to be, for the hazardous employment he is engaged in. But where an employer has failed to put on an appliance which the law requires, or uses an unsafe one, or where the employer employs a man to manage or direct who is not a proper person and shows by his conduct he is not, I believe the employer should pay.

Again, to carry the fellow-servant idea to the extent of claiming that an Italian laborer, digging along the railroad track with a boss who says, standing over him, "Go ahead, what are you looking at," when he lifts his head—to maintain that he is a fellow-servant of an engineer who comes down a track at a tremendous rate of speed and cuts him in two, is not just from my point of view. He is kept at work by the representative of the corporation, who does not allow him to look up for safety, who says, "I am your eyes." To say the engineer is a fellow-servant and the railroad is not responsible is not right.

Q. Are not the State courts, as a rule, becoming more liberal toward the employee?—A. Yes; there is a recent case in North Carolina where the judge took very advanced grounds. A person was injured. It was held, by reason of the fact that the railroad did not use the appliance which experience had shown to be the best—safety appliances—that the railroad was liable. This was the Greenlee Case, decided by Judge Clark in May, 1898. In 1893 the safety-appliance law went into effect. The first provision was that the engineer, on and after five years from the date of passage of the law, should be enabled to control his train from the cab; and just as the passenger train was at that time being controlled, so it was required that railroads should not run freight trains which were not capable of being controlled by the locomotive engineer—that is, by the use of the air brake and train brake; and that a necessary proportion of the cars should be equipped to enable them to do it. Of course that would vary. On roads running across the prairie it would not be necessary to have so many cars equipped as it would be in a mountainous country to enable an engineer to control his train. This was the first provision. The second provision was that, after five years, no railroad engaged in interstate commerce should use cars which required men to go between them to couple them, and it stopped there; otherwise it would have been as gigantic a job as was ever forced upon anybody, as you can well imagine. If the law had said that any particular device was to have been used it would have cost the railroads additional millions in paying royalties, etc., over the proper cost for the adoption of an automatic coupler to have applied them; and you can imagine what it would have meant to have turned the railroads over to the tender mercies of the patentee, but it was left to the economies of railroad transportation and those who made a study of them to work out the method of coupling which would relieve the men from the danger of going in between the cars to couple and uncouple. What should be used to accomplish this end resulted in a great struggle. A great many roads were in favor of what is known as the Janney type of coupler, which is a vertical plane coupler, and which had been adopted by the Master Car Builders, while others advocated the continuance of the old type, the link and pin, which was claimed (and I believe it is true) could be made, and was made, automatic, so that this also could be used without men going in between the cars. Now the contest came between the two types

of couplers, and it resulted in the general adoption of the M. C. B. coupler. The exigencies of railway operation require that the slack, which all of us have heard about, must be done away with, for to properly work the air brake you must have a solid train. Otherwise, when you undertake to use an air brake each car becomes a battering-ram, so to speak. It is therefore necessary to make the train as solid as possible.

It is now claimed that a solid train can be moved with less power than can one with slack between the couplers. So the contest went on, and finally out of it the Master Car Builders' type of coupler won. Now, this type of coupler at the time the law went into effect was free from patents, anybody could use it—anybody could build upon that type of coupler. Of course there were certain claimed improvements on it upon which there were patents, but the general type of the coupler was free from patent rights and a road could go into the market and get couplers as good as anyone else had without paying a royalty.

Q. (By Mr. FARQUHAR.) Was this coupler the property of the Master Car Builders' Association and given to all the roads as a benefit?—A. Hardly that. The first type was what was known as the Jamney type, but Jamney, prior to the passage of this law, released all claims he had to the patent to what was known as the contour line, so that anybody could make the M. C. B. coupler prior to the passage of the law. If they saw fit to use that style of coupler, they could do it without paying royalty to anyone.

Q. Was this coupler adopted by the Master Car Builders' Association?—A. Yes; and it has worked out so that about 75 per cent of the cars are now equipped with the M. C. B. type of coupler.

The next thing in the bill were the hand-holds. Many roads used no hand-holds or grab irons on their freight cars, though recommended to do so by the American Railway Association and the Master Car Builders' Association; some had them in one place on the car and some had them in another. The law required that all railroads should have hand-holds at the ends and sides of the cars. That was particularly important during the transition period, where the coupling had to be made between the old-fashioned coupler and the Master Car Builders' coupler, and therefore the switchmen had to get between the cars more than ever to couple up. Then another provision of the law was that the drawbars of the cars should be of a maximum or standard height. Now Congress, instead of undertaking to determine itself or leaving it to public officials to do, left the railways themselves, through the American Railway Association, to establish and determine the height, which they did. And 31½ inches was fixed to be the minimum height and 34½ the maximum height for drawbars—3 inches variation being allowed. This resulted in the saving of many lives. Penalties were fixed for failure to comply with the law, and then, as I have stated before, though an employee knew there was failure to comply with the law, that could not be raised as reason why the railroads should not be compelled to pay for injuries. A duty was also imposed upon the Interstate Commerce Commission to grant additional time to the railroads, if they, after full hearing, believed that it should be done. When the act was about to apply to drawbars and hand-holds the railroads asked a short additional time in which to comply, and after notice to all the railroad organizations in the country, and as far as could be the railroad employees interested, and after full hearing, a short extension was granted, both as regards the hand-holds and drawbars. So effectively had the law been observed that when it went into effect it is said the Pennsylvania Railroad held in its yards over 2,500 cars one night until hand-holds were put on them, and the Reading held some 3,000, and this was the fact all over the country. The commission has an employee who is a practical railroad man who goes all over the country, examines the freight cars, and it is surprising to find how few cars there are that are not equipped with hand-holds or cars which vary in height, and then it is some fractional part of an inch, and generally they are too high rather than too low—the car repairers being fearful that the cars may settle down too far. Then when it came to the question of an extension of time in which to equip with couplers and of having the cars equipped with a sufficient number of air brakes and train brakes, the railroads also asked for further time and demanded that they be given five years. They had already had five years, and it was found that certain railroads had not equipped 2 per cent of their cars in that whole period. Other roads—many of them—were fully equipped. Now the inhibition of the law was that you should not haul or permit to be hauled on your line; anybody could have a car equipped in any manner desired; it was only when they undertook to haul it that the law applied; for that reason, if the Louisville and Nashville Railroad's cars were not equipped, the Pennsylvania Railroad could not haul them, and to that extent was punished for the failure to comply with the law of the other road.

Q. Was there any penalty attached to that law?—A. Yes; \$100 for every violation. Therefore, after a full hearing, the commission failed to grant five years, but taking into account the great financial depression through which the roads went and the railway employees having agreed, as far as their view could be ascertained through their representatives, an extension of two years from January 1, 1898, was granted. The result has been, I believe, that one-half of the cars at least, which were not equipped at that time, have been equipped, and I have little idea that any railroad will ask for a further extension.

Q. (By Mr. C. J. HARRIS.) Have you statistics showing the results of this change of appliances?—A. I believe it can be fairly claimed the adoption of this humane law by Congress has resulted in the saving of very many lives. In 1893 there were over 280 more men killed in coupling and uncoupling cars alone than there were in 1897, and over 4,000 more men were injured than in 1897, so that there are only one-half the number of men killed in coupling cars alone, and nearly one-half of those injured as formerly—a saving to the Republic of American citizens, because these are all men in the full vigor of life—than were the casualties resulting from the Spanish-American war, that changed the whole map of the world. In 1897 there was a regiment of men, 1,067, less employees killed on the railroads of the United States than there were in 1893. Of course you must take into account the amount of freight handled, the number of men employed; but in looking at it in that view, there is about one-half as many killed and half as many injured as there were when this law was enacted. How much of this is due to the enactment of the law I leave others to determine. A short time ago Mr. Francis P. Hopwood, who is the railway secretary of the British Board of Trade, came to this country to look into the workings of this law; and while there has sprung up in Great Britain the same opposition encountered here (the expense of the change in Great Britain it is claimed would be about £7,000,000, or \$35,000,000), I believe Great Britain will ultimately follow our example and enact a safety-appliance law.

I hope no one will understand that, from any remarks of mine, I believe the individual railroad manager is a hard-hearted man—that he has not a due regard for the welfare of men employed by him. The railway managers have as big hearts and, in the main, are as kind as anybody else. The Pennsylvania Railroad raised no opposition to the passage of this law, in fact was friendly to it. The Chicago and Northwestern and other railroads took the same position, while still others I could name fought the bill with all the power they could.

Q. Has there been a decrease of expense to the railroads from the time of making this change?—A. The loss in coupling pins and the loss in links and the breakages which occur in drawbars—connected with the old style of coupler—is great; I have figures which show that it costs over \$2 a year to maintain each car; whereas it is found that the new type of coupler does not cost 50 cents to maintain, and if that ratio is carried out the result of this law is ultimately going to be a saving to the railroads of over a couple of millions a year in that respect. Now, another thing it should be borne in mind the absolute necessity that the freight locomotive engineer should control his train, particularly when running on a single track with passenger cars ahead of his freight train. The rear-end collisions at times in the history of railroads have been appalling, largely occasioned by freight trains running into the rear of passenger trains that have become stalled; but with the use of the air brake the control of the freight train is almost as complete as the passenger train. Freight trains can make a much faster time because the engineer does not have to shut off steam miles away and whistle for brakes. Now they can run right up to a station before shutting off steam. It is increasing the facilities with which freight trains can be handled, and has enabled the railroad management to meet another great exigency of economy in present railway management. You will recall the time when the carload was 20,000 or 21,000 pounds. Trains are now being run where the capacity of cars is from 80,000 to 100,000 pounds. Of course the railroad employee is performing a very much larger service than he ever did. His wages are not being reduced, but you have got to bear in mind that where an employee hauled or handled 200 tons in a train he can now handle 600 or 800.

Now, coming to the "associations and organizations of employees of railways and other carriers by land." Here is an act to legalize incorporation of national trades unions with the right to appear by their representatives, and that is a thing which the workmen of the United States, the people of the United States, scarcely realize. It is hardly known that there is such a law on the statute books. They have all the rights of an incorporation. If there is any advantage to be gained in the incorporation of capital, they have the same right to have a corporation where labor is the fundamental object.

The act referred to is as follows:

“[PUBLIC—No. 90.]

“AN ACT to legalize the incorporation of national trades unions.

“*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the term “national trade union,” in the meaning of this act, shall signify any association of working people having two or more branches in the States or Territories of the United States for the purpose of aiding its members to become more skillful and efficient workers, the promotion of their general intelligence, the elevation of their character, the regulation of their wages and their hours and conditions of labor, the protection of their individual rights in the prosecution of their trade or trades, the raising of funds for the benefit of sick, disabled, or unemployed members, or the families of deceased members, or for such other object or objects for which working people may lawfully combine, having in view their mutual protection or benefit.

“Sec. 2. That national trade unions shall, upon filing their articles of incorporation in the office of the recorder of the District of Columbia, become a corporation under the technical name by which said national trade union desires to be known to the trade; and shall have the right to sue and be sued, to implead and be impleaded, to grant and receive, in its corporate or technical name, property, real, personal, and mixed, and to use said property, and the proceeds and income thereof, for the objects of said corporation as in its charter defined: *Provided*, That each union may hold only so much real estate as may be required for the immediate purposes of its incorporation.

“Sec. 3. That an incorporated national trade union shall have power to make and establish such constitution, rules, and by-laws as it may deem proper to carry out its lawful objects, and the same to alter, amend, add to, or repeal at pleasure.

“Sec. 4. That an incorporated national trade union shall have power to define the duties and powers of all its officers, and prescribe their mode of election and term of office, to establish branches and subdivisions in any Territory of the United States.

“Sec. 5. That the headquarters of an incorporated national trade union shall be located in the District of Columbia.

“Approved, June 29, 1886.”

It was amended by the act of June 1, 1898, as follows:

“Sec. 8. That in every incorporation under the provisions of chapter five hundred and sixty-seven of the United States Statutes of eighteen hundred and eighty-five and eighteen hundred and eighty-six it must be provided in the articles of incorporation and in the constitution, rules, and by-laws that a member shall cease to be such by participating in or by instigating force or violence against persons or property during strikes, lockouts, or boycotts, or by seeking to prevent others from working through violence, threats, or intimidations. Members of such incorporations shall not be personally liable for the acts, debts, or obligations of the corporations, nor shall such corporations be liable for the acts of members or others in violation of law: and such corporations may appear by designated representatives before the board created by this act, or in any suits or proceedings for or against such corporations or their members in any of the Federal courts.”

Now, sections 9 and 10 of the act of June 1, 1898, are as follows:

“Sec. 9. That whenever receivers appointed by Federal courts are in the possession and control of railroads, the employees upon such railroads shall have the right to be heard in such courts upon all questions affecting the terms and conditions of their employment, through the officers and representatives of their associations, whether incorporated or unincorporated, and no reduction of wages shall be made by such receivers without the authority of the court therefor upon notice to such employees, said notice to be not less than twenty days before the hearing upon the receivers' petition or application, and to be posted upon all customary bulletin boards along or upon the railway operated by such receiver or receivers.

“Sec. 10. That any employer subject to the provisions of this act and any officer, agent, or receiver of such employer who shall require any employee or any person seeking employment as a condition of such employment to enter into an agreement, either written or verbal, not to become or remain a member of any labor corporation, association, or organization; or shall threaten any employee with loss of employment, or shall unjustly discriminate against any employee because of his membership in such a labor corporation, association, or organization; or who shall require any employee or any person seeking employment as a

condition of such employment to enter into a contract whereby such employee or applicant for employment shall agree to contribute to any fund for charitable, social, or beneficial purposes; to release such employer from legal liability for any personal injury by reason of any benefit received from such fund beyond the proportion of the benefit arising from the employer's contribution to such fund; or who shall, after having discharged an employee, attempt or conspire to prevent such employee from obtaining employment, or who shall, after the quitting of an employee, attempt or conspire to prevent such employee from obtaining employment, is hereby declared to be guilty of a misdemeanor, and upon conviction thereof in any court of the United States of competent jurisdiction in the district in which such offense was committed, shall be punished for each offense by a fine of not less than one hundred dollars and not more than one thousand dollars."

These enactments were largely brought about by an act of injustice by the receivers of the Reading Railroad, which was approved by a Federal court. Some time ago the Reading Railroad revived a regulation which had become an absolute dead letter to the effect that no employee should become a member of a labor organization, and if he did he should be discharged. The general manager of the railroad company called upon some of the railroad employees to come to his office and told them to cease their membership, and demanded that they hand to him the charters and documents belonging to the lodge in the place, and said he must carry out the directions of the receivers. "If you do not do it, I shall turn you off," said he. These men appealed to their brotherhoods, and particularly to the Brotherhood of Railroad Trainmen. They were all interested in it. At my suggestion they came to Washington to see Mr. Olney, who was at that time Attorney-General of the United States, and consulted with him about their rights. The Attorney-General believed that they were wrongfully treated, and said he would see what could be done. He sent for the counsel of the Reading Railroad and urged him to rescind the order. The counsel said he would take it before the receivers and would endeavor to get them to do it. In a few days Mr. Olney got word from them that they proposed to carry out their rule, that any man belonging to a labor organization should be discharged.

Q. (By Mr. FARQUHAR.) Was that the order of the receivers that was to be carried out?—A. The order of the receivers. Mr. Olney then suggested that before anything should be done in the courts they return and remonstrate individually with every receiver. They did so, but to no purpose, as they were virtually shown the door. Then Mr. Olney said, "Bring your bill in the court, asking the courts to enjoin the receivers," and the bill was brought. It was decided to have counsel, and the best that could be had in Philadelphia and Washington was obtained and went into the United States court there. The first thing the counsel for the railroad said was that this man Wilkinson, a representative of the brotherhood which brought the suit, was not an employee of this railroad, and was not a proper party complainant. Mr. Wilkinson's counsel replied that if he divulged the names of the men in whose behalf he was appearing they would be put on the blacklist and discharged, and he did not want to offer them up for that purpose. Mr. Olney believed it was fair; that the bill should be brought by Mr. Wilkinson. The court held that if they wanted relief they must appear themselves, and dismissed the bill. The case was then brought in the name of three employees, who were offered up as a vicarious sacrifice. As was known, the men were discharged, and, to the credit of the Pennsylvania Railroad, they took care of them. Mr. Olney filed a statement as "amicus curiae." I commend it to your attention as a fair presentation of the right of men to organize. And I want to say to the credit of the railroad employees, they went down to Harrisburg and got a law passed that would now put a receiver in jail who followed this precedent. The judge, however, rendered an opinion, though there were eight States in this Union that made it a criminal offense to deny a man employment or refuse to continue his employment because he belongs to a labor organization, that these receivers could use their employees as they saw fit.

I have no particular statistics, but a large number of the railroads in the United States to-day are being run upon rules and regulations, and rates of pay, which have been agreed to between the representatives of the various organizations and the railroad managers. At this time there is a feeling of perfect accord between the employer and employees, as far as I can learn, and, while there are a great many men engaged in railway employment who do not belong to an organization, still there is no antagonism on the part of the members of these organizations and those who do not belong to them, and who do not receive all the benefits of the combination which these organizations confer. Of course, these organizations not only have the question of wages, hours of service, and everything of that sort to deal with, but they all also have the beneficial insurance features. The railway employment is so hazardous that they can not obtain insurance elsewhere, except

in rare instances; they therefore insure themselves through their organizations. A man joins the organization largely by reason of the fact that he desires to protect his family against the contingency of death or injury.

Q. Have the five brotherhoods insurance companies of their own?—A. All of them have, and the amounts of benefits they have paid runs into the millions.

DISPUTES AND DIFFERENCES BETWEEN EMPLOYERS AND EMPLOYEES.

One object of the arbitration bill passed June 1, 1898, which applies only to railroads and their employees, was that without any surrender apparently of any ground which either side held—without any appearance of giving in—arbitration could be brought about. The Government, through its officers, after endeavoring to settle the matter by conciliation, steps in and says to the disputants, "This difficulty has gone far enough and you had better agree to arbitration." Now, under these circumstances the side that will not arbitrate will receive the public condemnation, for the public knows who is in the wrong; so now the wronged have a means of reaching public sentiment, of enlisting the public with them, avoiding strikes which interrupt the public in the enjoyment of transportation facilities, and which turn the people against the strikers, no matter if their cause is just. What has been the result? I have asked every one of the representatives of the organization, and they say that the relations have never been so pleasant as since the passage of the law. It has been said to me, "We do not want to invoke the operation of that law, and our employers do not, and therefore they meet us on common ground with good feeling, and while we have to give in at times they also give in; but we meet and we know if we do not settle it between ourselves, the Government will step in." Since the passage of that law there has not been the slightest murmur, and it meets the approval of every railroad man I have met. There are some who predict that there will not be any more strikes. We really believe it is the era of good feeling.

Now, another matter. If not a sparrow falls to the ground without Divine knowledge, why should American citizens, our people, be maimed and killed and no record of the circumstance attending the casualty kept? I believe there should be a requirement in case of a collision or where persons or employees are killed or injured upon the railroads that the Interstate Commerce Commission should be notified of it at the time it occurs. It would do very much to decrease the number of accidents upon our railroads. When you open the light of day upon such things, and give the public an opportunity of ascertaining the cause of injury to a man, either a passenger or an employee, you will find that eventually the number of killed and injured will be decreased.

Q. Have the railway commissioners of some of the States the right to do that?—A. Quite a number of them have. Under their State laws they have the opportunity to investigate these facts. Many of our states have railway commissions, while others of them pay no attention to the matter. The National Government statistics furnished by the roads also require revised classification. For instance, a man is hurt; he is reported as injured in coupling cars when the real fact is he is running down a track and tumbles over a tie and falls down and gets hurt. He is reported as injured in coupling cars simply because he is engaged in that occupation. The means are not at hand to ascertain the actual facts. The commission has no means of learning the real cause of the injury.

Q. Could the interstate commerce law be amended to reach such a case as that?—A. I do not think there is the slightest doubt of it. I have a bill amending the act to promote the safety of employees, etc., which covers this point, I think. It is as follows:

"Be it enacted by the Senate and House of Representatives of the United States in Congress assembled, That there be added to the act entitled 'An act to promote the safety of employees and travelers upon railroads by compelling common carriers engaged in interstate commerce to equip their cars with automatic couplers and continuous brakes and their locomotives with driving-wheel brakes, and for other purposes,' approved March 2, 1893, the following:

"SEC. 9. That where any collision of trains where one of the trains is a passenger train shall occur on a railroad of any common carrier engaged in interstate commerce by railroad, or where any passenger train, or any part of a passenger train accidentally leaves the rails, it shall be the duty of the general superintendent or general manager, or other officer in general charge of the movement of trains on said road, immediately thereafter to transmit a full and detailed report under oath of such accident, and the causes thereof so far as known, to the Interstate Commerce Commission at their office at Washington, D. C. It shall also be the duty of any such common carrier to make to the Interstate Commerce Commission a monthly report under oath of all accidents which may occur to its

passengers or employees, whether attended with loss of life or personal injury, and such report shall state the causes and circumstances connected therewith. That any common carrier failing to make such report within ten days after the end of any month, or failing to make report of any collision or cars leaving the rails accidentally, as herein required, within ten days after the occurrence of such accident, shall be deemed guilty of a misdemeanor, and, upon conviction thereof by a court of competent jurisdiction, shall be punished by a fine of not less than one hundred dollars, and not more than five hundred dollars for each and every offense, and for every day during which it shall fail to make such report after the time herein specified for making the same. The failure of the superintendent, general manager, or other officer in charge of the movement of trains, to make report to the Interstate Commerce Commission as herein required, shall be deemed the offense of the carrier as well as of such officer himself.

"SEC. 10. The Interstate Commerce Commission is authorized to prescribe for such common carriers a method and form for making the reports in the foregoing section provided."

This bill was introduced by Senator Pettigrew in the Fifty-fifth Congress, and is Senate bill No. 3244.

Q. Would such reports to the commission open the doors a good deal to suits for damages?—A. I should not want to have the facts used in that way; none of these reports should be used in any damage suits, and it might be provided in the act that they should not be.

The intent is to call the attention of the public to accidents upon the roads. Of course to-day every accident is supposed to be annually reported to the Interstate Commerce Commission, and they have authority to ask for it. They may not have authority to ask for a monthly report. They can ask for annual reports, but that hardly gets at it. Reports at the time of the accident are what are desired.

Another thing, right here, almost under the shadow of the dome of the Capitol, men have been killed within the last few years by having their feet caught in frogs, and there they have been held as in a vise, and the train backs down on them and kills them. I now recall a case. It was a particularly distressing case. This poor fellow had a wife and a number of children. When he was killed, for a few hours everybody would tell you all about it. I followed the thing up. A dozen hours had not gone by before nobody knew anything about it at all; even his wife did not. She said: "I do not dare say anything about it, because my brother-in-law is employed on the railroad, and if I say anything about it he will get his discharge."

I will read a bill which will cover this matter. I think it fully avoids any requirement which would force the railroads to adopt any particular device.

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That all persons, companies, or corporations owning and operating a railroad or railroads or operating a railroad owned by another person, persons, company, or corporation within the military reservations of the United States, the Territories, or the District of Columbia, shall be, and are hereby, required, within six months after the passage of this act, to so adjust, fill, or block, or securely guard the frogs, switches, and guard rails on their roads (with the exception of guard rails on bridges), so as to thoroughly protect and prevent the feet of employees or other persons from being caught therein.

"SEC. 2. That within ten days after compliance with this act by persons, corporations, or companies to whom it applies, such persons, corporations, or companies shall make report of the fact to the United States Interstate Commerce Commission.

"SEC. 3. That any person or persons, railroad company, or corporation owning and operating a railroad or railroads in any of the States or Territories, military reservations, or the District of Columbia, who shall fail to comply with the provisions of this act, shall be fined in a sum not less than five hundred dollars, nor more than two thousand dollars, in the discretion of the court, for each offense, and the neglect of any such person, company, or corporation to comply with the provisions of this act shall be deemed a violation of the same.

"SEC. 4. That the penalties herein prescribed shall be recovered by action brought in the United States district courts; and it shall be the duty of the United States district attorneys for said courts having jurisdiction in the premises to institute and prosecute such action for violations occurring therein, upon duly verified information coming to him of the occurrence of such violations.

"SEC. 5. That all persons, companies, or corporations owning or operating railroads in said States or Territories, reservations, or District of Columbia, shall, in addition to the penalties prescribed in this act, be liable for any damage resulting

from the failure to comply with the provisions thereof, such damage to be recovered by the persons injured, or his or her legal representatives."

I also have another bill to which I would call the attention of this commission:

"AN ACT to promote the safety of employees upon railroads by compelling persons, firms, companies, and corporations operating railroads to equip their cars and locomotives with automatic couplers, continuous brakes, and grab irons; their locomotives with driving-wheel brakes; to provide a standard height for drawbars for freight cars and engines; and to adjust, fill, or block all frogs, switches, guard rails, and all other obstructions which are a part of, or are near, their tracks as to prevent the feet of employees from being caught therein.

"SEC. 1. *Be it enacted by the Senate and House of Representatives in general assembly met, and it is hereby enacted by the authority of the same:* That from and after the first day of January, nineteen hundred, it shall be unlawful for any person, firm, company, or corporation engaged in operating any railroad within this State to use on his or its line any locomotive engine in transportation between points or places in this State which is not equipped with a power driving-wheel brake and appliances for operating the train-brake system; or to run any train used in such transportation after said date that has not a sufficient number of cars in it so equipped with power or train brakes that the engineer on the locomotive drawing such train can control its speed without requiring brakemen to use the common hand brake for that purpose.

"SEC. 2. That on and after the first day of January, nineteen hundred, it shall be unlawful for any such person, firm, company, or corporation to haul, or permit to be hauled, or used on his or its line any cars or locomotives used in transportation between points or places within this State not equipped with couplers coupling automatically by impact, and which can be uncoupled without the necessity of men going between the ends of the cars.

"SEC. 3. And from and after the first day of January, nineteen hundred, it shall be unlawful for any such person, firm, company, or corporation to use any car in such transportation that is not provided with secure grab irons or hand holds in the end and sides of each car for greater security to men in uncoupling cars.

"SEC. 4. That the standard height of drawbars for freight cars and locomotives measured perpendicular from the level of the tops of the rails to the centers of the drawbar shanks, for standard-gauge railroads in this State shall be a maximum height of thirty-four and one-half inches for empty cars, and a minimum height of thirty-one and one-half inches for loaded cars; and for narrow-gauge railroads in this State the standard height of drawbars shall be a maximum height of twenty-six inches for empty cars, and a minimum height of twenty-three inches for loaded cars. And after the first day of January, nineteen hundred, no cars, either loaded or unloaded, shall be used in transportation within this State which do not comply with the standard above provided for.

"SEC. 5. That from and after the first day of January, nineteen hundred, every person, firm, company, or corporation engaged in operating any railroad within this State shall have all frogs, switches, guard rails, and other constructions which are a part of, or are near, his or its tracks so adjusted, filled, or blocked as to prevent the feet of any railroad employees being caught therein.

"SEC. 6. That any such person, firm, company, or corporation using any locomotive engine running any train, or hauling, or permitting to be hauled, or used on his or its line any car or engine, or having on his or its line any frog, switch, guard rail, or other construction in violation of any of the provisions of this act shall be liable to a penalty of one hundred dollars for each and every such violation, to be recovered in a suit or suits to be brought by the attorney-general in any court of competent jurisdiction; and it shall be the duty of the attorney-general to bring such suits upon duly verified information being lodged with him of such violation having occurred. And it shall also be the duty of the ——— of this State to lodge with the attorney-general information of any such violations as may come to his knowledge: *Provided*, That nothing in this act contained shall apply to trains composed of four-wheeled cars, or to locomotives used in hauling such trains.

"SEC. 7. That any employee of any such person, firm, company, or corporation who may be injured by any locomotive, car, train, frog, switch, guard rail, or other construction in use contrary to the provisions of this act shall not be deemed to have assumed the risk thereby occasioned, although continuing in the employment of such persons, firm, company, or corporation after the unlawful use of such locomotive, car, train, frog, switch, guard rail, or other construction had been brought to his knowledge."

(Mr. Moseley's testimony was continued on December 7.)

MR. MOSELEY. With some care I prepared the statement which I handed you yesterday, "Authorities upon the law of damages caused from injuries received (1) by negligence of a fellow-servant, and (2) by defective appliances," which I

again desire to call your attention to, as it affects railroad employees, because almost all their cases sooner or later get into the Federal courts—the State courts have little to do with the suits of railroad employees for damages for negligence on the part of the employers.

Q. (By Mr. PHILLIPS.) Have you any law to suggest to meet this question of a fellow-servant?—A. Yes; to the extent of the bill I suggested yesterday, but I would not ask this commission to report to Congress a bill, or assume there was necessity for a national law regarding the liability of employers for injuries to employees, without the fullest investigation and without the opportunity being given to be heard. I mean by that, as it is a matter which would entail a large number of damage suits upon railroad corporations from time to time, therefore they ought to have full opportunity to be heard, but I do believe it is a question which sooner or later Congress must deal with.

Q. Do you think that a fellow-servant could be defined in a general law?—A. I do not think there is any trouble in defining what a fellow-servant is. Many of the States are undertaking to define it. As I said yesterday, the railroad employees of the country are engaged in a semipublic employment—in a national work; if they obtain any redress at all, they must obtain it through the Congress of the United States. I have not gone into the field of the ordinary industrial pursuits or the relation between an employer and employee in such industrial pursuits, because I believe these matters are very largely under State control and one which the people of each State should settle for themselves, as far as the relations between one citizen and another of that particular locality is concerned. But when we come to the railroad employee the case is different, for there is hardly a railroad in the United States that the courts have not held by their rulings are engaged in interstate commerce and therefore under national control, and where any difficulty occurs between employer and employee the Federal courts are the ones that are resorted to, that they may put the strong arm of the Federal power into the scales. Also wherever a case occurs of damage by accidents or any cause it is almost sure to reach the Federal courts. Therefore I believe these are matters which, if Congress itself does not deal with and does not bring about uniformity in by legislation—why decisions are as varying as are the ideas of the several judges—judge-made law will continue to largely govern the determination of all these cases. For that reason particularly I believe it is a matter which Congress may well devote its attention to, particularly in view of the fact that it has for a long time become more and more emphasized by the courts that the railroad employee is a servant of the public, not particularly a servant of the citizen of any particular locality, but he is a servant of the public at large, and his responsibilities and his duties to that public are constantly being put before him. He is constantly being reminded by the courts of them, and therefore if you are going to put the railway employee in this position he certainly has a right to expect that public which he serves or the representatives of it will see that he is protected in those things in which he is justly entitled to protection. As I said in the Fifty-third Congress, after a good deal of study on the subject, I drew a bill and handed it to a friend of mine then in Congress, and he introduced it, and that was the bill relating to the liability of employers engaged in interstate commerce to their employees which I read yesterday. If the commission does not go as far as that, I think they at least should recommend to Congress, after an examination of the subject, to define a fellow-servant and how far the employer is liable for the acts of a fellow-servant.

I will read a "memorandum of the case of *Baltimore and Ohio v. Baugh*," in the Supreme Court of the United States, which I have prepared, and to which I referred yesterday:

"Section 721 of the Revised Statutes declares that 'the laws of the several States, except where the Constitution, treaties, or statutes of the United States otherwise require or provide, shall be regarded as rules of decision in trials at common law in the courts of the United States in cases where they apply.' It would seem that the term 'laws' here used would include not only the statute laws of the States, but also those which are expressed in the decisions of their judicial tribunals. In the recent case, however, of the *Baltimore and Ohio Railroad Company v. Baugh*, a majority of the Supreme Court of the United States (Justice Brewer delivering the opinion) held that in a case involving a question of 'general laws,' the United States courts were not bound to follow the decisions on that question of the supreme court of the State in which the cause of action arose. This case illustrates in a most striking manner the necessity for some more explicit legislation on this subject. The plaintiff, *Baugh*, was a citizen of Ohio, and the defendant, the *Baltimore and Ohio Railroad Company*, a corporation created by the laws of Maryland. The suit was brought originally in one of the

courts of the State of Ohio, but the defendant claimed citizenship in Maryland by virtue of its incorporation in that State, and on this ground obtained a removal of the action to the circuit court of the United States for the southern district of Ohio. The ground of action was damages alleged to have been sustained by the plaintiff while discharging his duty as fireman on a locomotive of the defendant, and he obtained a judgment in the circuit court for \$6,750.

"Under the decisions of the supreme court of Ohio on the question of law involved the plaintiff was entitled to this judgment, and the Federal circuit court in rendering it followed the rule of law as settled by the State court. The United States Supreme Court, however, on appeal, reversed this judgment, adopting a different rule of law and ignoring the decision of the supreme court of the State in which the cause of action arose. The important question is, not whether the view of the law taken by the United States Supreme Court or that held by the State court was correct, but whether such an inharmonious administration of the law should be allowed to continue—whether the right of recovery by a citizen who claims to have been injured in his reputation or person or property shall depend upon the forum in which his case may be tried—whether on a mere fiction a suit commenced in one court where a recovery could be had may be removed to another in which it may be defeated. In his dissenting opinion in this case, Justice Field vigorously presents the facts and the glaring injustice of such a system of jurisprudence. He says, 'The present case presents some singular facts. The verdict and judgment of the court below were in conformity with the law of Ohio, in which State the cause of action arose and the case was tried, and this court reverses the judgment, because rendered in accordance with that law and holds it to have been error that it was not rendered according to some other law than that of Ohio, which it terms the general law of the country. This court thus assumes the right to disregard what the judicial authorities of that State declare to be its law, and to enforce upon the State some other conclusion as law which it has never accepted as such, but always repudiated. The fireman, who was so dreadfully injured by the collision caused by the negligence of the conductor of the engine that his right arm had to be amputated from his shoulder and his right leg was rendered useless, could obtain some remedy from the company by the law of Ohio as declared by its courts; but this court decided, in effect, that that law thus declared shall not be treated as its law, and that the case shall be governed by some other law which denies all remedy to him. Had the case remained in the State court, where the action was commenced, the plaintiff would have had the benefit of the law of Ohio. The defendant asked to have the action removed, and obtained the removal to a Federal court because it is a corporation of Maryland, and thereby a citizen of that State, by a fiction adopted by this court that members of a corporation are presumed to be citizens of the State where the corporation was created: a presumption which, in many cases, is contrary to the fact, but against which no averment or evidence is held admissible for the purpose of defeating the jurisdiction of a Federal court. (*Railroad Co. v. Letson*, 2 How., 497; *Cowless v. Mercer Co.*, 7 Wall., 121; *Paul v. Virginia*, 8 Wall., 168-178; *Steamship Co. v. Tugman*, 106 U. S., 120.) Thus in this case a foreign corporation, not a citizen of the State of Ohio, where the cause of action arose, is considered a citizen of another State by a fiction, and then, by what the court terms the general law of the country, but which this court held in *Wheaton v. Peters* has no existence in fact, is given an immunity from liability in cases not accorded to a citizen of that State under like circumstances. Many will doubt the wisdom of a system which permits such a vast difference in the administration of justice for injuries like those in this case between the courts of the State and the courts of the United States."

I would add, if this man was injured on a railroad paralleling the Baltimore and Ohio, which was an Ohio corporation, and unless by some means they were able to get it into a Federal court, he would probably obtain damages; yet here in the case of a foreign corporation paralleling a State road and the employee, a citizen of Ohio, can not get relief. Therefore I say to this commission, and beg your attention to the subject, either to suggest to Congress the passage of a national employers' liability act, or else the passage of some act which will tend to bring about uniformity in this question of employers' liability.

In regard to the relations of railroads to the public, it is almost sufficient to say that the Interstate Commerce Commission has been for nearly twelve years asking Congress for legislation which its experience in administering the act to regulate commerce has shown to be indispensable to effective regulation in the public interest. As secretary of the commission, I have no other views on this subject than those which have been expressed by the commission itself in its reports to Congress. Each of those reports constitutes the record of a year devoted to the

work of regulation. The chairman and other members of the commission wish me say that they will be glad to give you the benefit of their views as to any of these matters at any time. One or two of the conditions now prevailing will, however, doubtless interest you at this time, and I will mention them briefly.

The act to regulate commerce requires that all rates shall be reasonable and just. It also provides that the commission shall execute and enforce its provisions. For fully ten years the commission proceeded upon the idea that its duty to execute and enforce the law involved the issuance of orders to carriers not to exceed the rate shown to be reasonable or just after complaint, hearing, and investigation. In 1897 the Supreme Court said that this view was wrong; that the commission was not authorized to prescribe rates for future observance by the carriers, and that the commission could only condemn the rate complained of, and incidentally award reparation. (*The Freight Bureau Cases*, 167 U. S., 479.) Condemning the present rate and awarding reparation is theoretically the remedy at common law, but as a matter of practice no one ever recovered a cent from a carrier for charging an unreasonable rate. In other words, the common law did not and does not afford a remedy. But beyond that, merely proceeding to recover excessive charges is no remedy. First, because the expense always involved in litigation must generally, of itself, deter the institution of such a proceeding. Second, because the person entitled to reparation is generally not the person who is injured. The rate, however excessive, is supposed to be published, and the goods have been bought and sold on the basis of that rate. Obviously the persons most likely to suffer injury are the producer and consumer, and sometimes the retailer, not the middleman or jobber, who is most frequently the shipper, and therefore the one who might be held entitled to recover the excess charge.

Q. (By Mr. C. J. HARRIS.) If parties do not obey decisions of the commission are they obliged to do so or not?—A. Yes, sir; the carriers do very often comply with the orders of the commission. But they will not if they consider that anything vital is involved. Of course the commission may bring suit in court to compel obedience to its order. The average time consumed in reaching final adjudication in such cases by the Supreme Court has been about four years. This practically denies the relief that obedience to the order might afford, and, in fact, enables the carrier to snap its fingers at the rulings of the commission. Now, if the commission were empowered, after hearing and investigation in particular cases, to fix the maximum reasonable and just rate, and if the law also provided that the order of the commission should become effective unless the carrier shows it to be unlawful upon application to the court for review, the result would be that relief would be granted as to all future shipments to the producer, to the consumer, to the retailer, and to all parties interested; and such relief would be summarily enforced unless the carrier could promptly show material error in the decision of the commission. A decision finding that the rate on flour from Minneapolis to Boston is 10 cents too high and an order not to charge, say, more than 20 cents for that service would benefit the Western miller and the New England consumer, as well as all intermediate handlers of that commodity. If you can say what the rate is to be, you benefit all who are commercially interested. If you can merely say the present rate in a particular case is wrong, you benefit only the man who has paid that rate in the case in question. As the law now stands, the commission can not order carriers to observe the rates which it finds, on investigation, to be actually reasonable—sufficient for the service rendered—and those orders which it does issue are practically nonenforceable because of inevitable long delay in the courts under the present procedure. When the act was passed it was supposed that the commission had full power to correct the tariff rates, and that its orders, except on plain showing of material error by the commission, would be summarily enforced by the courts. The commission can not determine and order the proper rate, and when it asks the court to enforce any order that it makes the case must be tried *de novo*, and, as before stated, the average time consumed in the courts has been about four years. Another present condition is shown in cases under the tenth, or penal, section of the law. If the published rate from Washington to New York is \$6.50 and the road carries a man for \$3, the company's agent can not be convicted of unjust discrimination unless it be shown that somebody paid the \$6.50 rate. And so it is with freight. The published rate may be so high that a shipper can not use it, but at the same time the railway agent may give a favored large shipper a much lower rate, and he will, in consequence, gradually secure a monopoly of the business.

Q. (By Mr. PHILLIPS.) Would that result in small shippers not being able to ship at all?—A. Precisely so. We have had plenty of such cases, but the courts will not hold it to be unjust discrimination unless someone, by actually paying a higher rate, is shown to have been wronged. In one case nearly \$12,000 were

expended in proof in a case against the former receiver and president of the Santa Fe road. It appeared that some millions of dollars had been paid out by that road in rebates, and that large amounts were paid to shippers of cattle. But it was not practicable to prove who was injured. Those who actually shipped had a monopoly of the trade.

No one thing has operated to the advantage of the large shipper—the trust—or to the detriment of the small shipper—the individual manufacturer or dealer—so much as this vicious railway practice of allowing rebates from tariff rates to large customers. Indeed, it has been said that without railway favors the industrial combination could not exist. Whether that statement is accurate or not, it is acknowledged by all who have given thought to the matter that cutting off this railway rebate advantage would most seriously cripple these great foes to individual enterprise.

The tendency of trusts is to lessen the number of employers, of establishments, and employees, and this to my mind is the alarming feature about them.

When establishments are many and a man who has spent his best energies, the efforts of the best years of his life, in acquiring a trade, finds himself differing with his employer as to hours of labor, conditions of service, or wages, he loses no whit of his manhood, no particle of his independence, for the reason that, if the differences are irreconcilable, the workman can lay down his tools and seek another situation.

But when the trust absorbs the scattered establishments into one organization, closes the more expensive and less profitable, and concentrates the production into a few favored localities, the workman is in danger of losing his identity as a man, sinking into the dependent condition of a part of the machinery of the institution. He becomes in a measure helpless, for an individual difference now with his employer means a loss of his means of livelihood—a shutting of the only door of opportunity to work at his chosen vocation. The responsibilities of family cares, which should add dignity and nerve to the man, are only weakness and a burden to the machine and make cowards of brave men for very love's sake. He dare not risk their lives and happiness by so much as a feeble protest at the wrong against which his manhood revolts, in fear that, losing his one chance of employment, he must start life anew or enter the ranks of the day laborer, already overcrowded and underpaid.

There is but one way which suggests itself to me by which labor may combat the evil of the trust, and that is far from being entirely effective. It is by thorough organization. This will not control—indeed, should not interfere with—the management or financial success of the institution. It will not always save the reduction of establishments and employees. But it will have the effect of preserving his identity and manhood; will give him the courage that is always born of numbers; secure an audience, the whole public, if necessary, for the relation of his wrongs; insure him, as an integral part of the machinery, the wholesome respect of the administration of the establishment.

With all his fellow-craftsmen behind him, his situation becomes infinitely improved, not only socially but in the public eye. His pleas and demands receive consideration, when delivered through the megaphone of his order, whether in the shop, in legislative halls, or in the courts, to say nothing of the beneficiary effects of such organization in substantial relief as well as social sentiment. Every encouragement should be given to organization; every trade should be organized; and when the wage-earners stand shoulder to shoulder the trust must still be feared, but its evils will have been mitigated so far as labor can accomplish such a result.

There are no more progressive men in any walk in life than the managers of railways, and to say that they are other than fair and considerate would not be just; indeed it is difficult to find among them individuals who are not all that anyone has a right to expect so far as the treatment of their employees is concerned. Many of them have sprung from the ranks. One speaks of the railway corporation, but he speaks of it collectively. It must be understood that the railways have done a great deal in the interest of their men, as their railway hospitals, their relief associations, their work under the auspices of the railway branch of the Young Men's Christian Association, and many other agencies for good will testify. No remarks that I have here made are made with any view of disparaging in the least degree the managers of railways, for whom I have the greatest respect, but it is to state conditions as they exist as fairly as I can. Great credit is due and should be accorded the American Railway Association and the Master Car Builders' Association, both of which had established such rules as to safety appliances and regulations as would, if they had been carried out by every railroad, made legislation unnecessary. It was from the very fact that their recommendations were being lived up to by some roads and not by

others that the chaotic condition existed which required the law to unravel and correct. Both of these associations have done a great deal for the railway employees as well as having been of great advantage in devising means looking to economy in railway operation. There is no class of men in the country more ready to respond to the calls of humanity and of justice than are those who operate railroads.

But in the matter of railway regulation, it is difficult for some railway managers to believe that business methods which are in use in every line of business should, if adopted and pursued in the operation of railways, be made criminal violations of law. The railway manager in the past has believed that his first duty was to the stockholders and investors in his property, and he neither relishes nor admits the right of interference in what was so long a private institution that he has forgotten in a measure his own official character and the rights of the public in an enterprise which the people have chartered by their votes, have given their lands for the right of way, have granted the supreme weapon of eminent domain to coerce unwilling individuals, have given millions of acres and billions of dollars to establish, and which in the opinion of many people, intelligent and otherwise, the people should themselves own. If open to criticism on any point, it is not a lack of humanity to their men, not in the intelligent management of the stupendous business under their control, not in the liberal and progressive spirit in which they have carried that management to the front rank in the world's system for safety, speed, comfort, and luxuries of transportation—but in an impatience of restraint, a resentment against suggestions from without, a failure to see good in the law, or good will in those called on to enforce it, though of both there are abundant evidences that only the willfully blind can fail to see.

When I first came to Washington, I early recognized the advantage of location, and opportunity, in the matter of furthering legislation, in the interest of the wage-worker, particularly of the employees of railways, now some 874,000 in number, the public character of whose employment, secures them greater attention and consideration, at the hands of Congress, than the average bread-winners in other vocations.

To assist so far as was in my power in this regard I deemed my duty, found in that effort the keenest pleasure, and it is with no little pride that looking backward over that twelve years the boast is mine that nothing was left undone on my part to help the cause as I saw the situation then or recall it now.

You will therefore understand with what satisfaction I have hailed the creation of this commission, which, though it secures not a line of legislation directly, will have performed a great work of education and reform by its exhaustive investigation. It is the forum for the presentation of those questions which vitally affect the life of the nation, questions of vastly more importance than those connected with our foreign relations, and upon the proper settlement of which the stability of our Government depends.

In these years of effort for the amelioration of the condition of labor and of intimate intercourse with the officers of their associations who so ably represent them, I have been more and more impressed with the high character of both.

The representatives of the railway employees who have been sent here to ask for legislation in their behalf command respect and win regard, and with those who do the no less important local work are imbued with a sense of responsibility not only to the men they serve but the country at large. They are conservative, law-abiding men, and they have neither asked nor advocated any legislation which can not be justified upon the ground of right, or defended from the vantage ground of humanity and a higher civilization.

I have memoranda of the bills I have suggested as follows:

"An act for the protection of railroad employees by requiring railroads to block their frogs, switches, guard rails, etc.

"An act to secure harmony in decisions of State and Federal courts to overcome the injustice to employees occasioned by decisions of the character of the Baltimore & Ohio against laugh.

"An act relating to the liability of employers engaged in interstate and foreign commerce for injuries to their employees, to bring the United States in this respect as near as may be to the laws of Great Britain in regard to employers' liability.

"An act to promote the safety of employees and travelers by requiring carriers to report all collisions and accidents which may occur upon railroads engaged in interstate commerce, with the causes and circumstances connected therewith limited to certain classes of accidents. This is in line with the laws of Great Britain.

"The suggestion that the States that have not done so as far as may be enact laws in line with the car-coupler or national safety-appliance law. Otherwise controversies are likely to arise as to whether the liabilities have occurred under the law; that is, whether the cars are engaged in interstate commerce."

WASHINGTON, D. C., March 1, 1899,

TESTIMONY OF JOHN T. WILSON,*Grand Chief, Brotherhood of Railway Trackmen of America.*

The Commission met at 11 a. m., March 1, 1899. Chairman Kyle presided and introduced the witness, Mr. John T. Wilson, Grand Chief of the Brotherhood of Railway Trackmen of America.

Mr. WILSON. I have prepared a paper pertaining to matters upon which I suppose the Commission desires to hear from me (reading):

The United States Industrial Commission, Washington, D. C.

GENTLEMEN: In obedience to your request for me to assist your honorable body in its efforts to obtain information which will enable it to recommend the enactment of laws to meet the problems presented by labor, agriculture, and capital, as I represent an organization composed of a class of men employed in transportation, known as the maintenance-of-way department employees, employed by railway companies engaged in interstate commerce, it is for that class of men I speak authoritatively. As I understand, your desire is to discover the actual conditions of the industrial workers of the country, and to discover causes for suffering, for injustice and inequality, so that you may be able to suggest remedies, I will explain the present condition of maintenance-of-way employees, and relate some of the causes which I believe aided in producing present industrial conditions.

There are in the United States 180,000 miles of railway, and according to the last report of the Interstate Commerce Commission about 180,000 men are employed in the maintenance-of-way department. This vast army of industrial workers is divided into three classes.

First. The class known as road masters numbers about 2,000, each having from 100 to 250 miles of track under his jurisdiction. Their divisions are cut into subdivisions called sections. The sections are from 5 to 10 miles each in length. On each section is employed a foreman who has a few assistants or laborers known as section hands. Road masters receive instructions from and make reports to division superintendents. They (the road masters) are fairly well paid, the minimum wage being about \$60 a month and the maximum about \$150 per month. The majority of the road masters seem to be in sympathy with the men under them, but they are not permitted to have anything to say about the terms of employment, the rate of wages they shall receive, the number of hours foremen and laborers will be required to work each day, etc., these matters being determined by higher authority, but on almost every large system of railway, some one is put in charge of a division in the capacity of road master who is ambitious to excel all other road masters on the system, and in order to have it said that he is the best road master on the system, he becomes a very hard master, drives the men under him from daylight till dark, and maintains his division at a minimum cost. As the higher officials are on the lookout for men who can produce the greatest results at the least cost, he becomes a favorite and is held up as an example for all other road masters on the system to follow. The most of them are poor men and are anxious to hold their positions; therefore, they feel compelled to be exacting and work the men under them to their full capacity from morning till night.

Second. The men in charge of subdivisions, known as section foremen, receive their instructions from and report to the road master. They number about 30,000. They are personally responsible for the condition of the track under their jurisdiction at all times, and are, in my judgment, the most important class of men engaged in operating railroads.

These men are required to work several years as laborers on track in order to learn enough about controlling men, repairing and maintaining tracks, to be qualified to assume the responsibilities of a track foreman.

The lives of the traveling public and the safety of commercial traffic are in their hands. They have more to do and more to look after to keep the track in a safe-running condition than any other class of railway employees. The track out of line, surface or gauge not properly tied or spiked, a guard rail out of place, or a mismatched joint, and many other little things that must receive their attention each day, would, if neglected, result in wrecking trains and destroying life and property. But few accidents on railroads can be traced to the negligence or carelessness of these men. They are always at their posts of duty without regard to hot or cold weather. At night, during storms and heavy rains, track foremen promptly leave their beds and patrol their track to see that all is safe for the passage of trains, and if the track has been obstructed by washouts or other causes it is usually discovered and red lights or other danger signals are displayed

at proper distances from the place of danger, signaling engineers in charge of engines pulling approaching trains to stop and avoid danger.

They are paid by the month and are supposed to be on duty at all times. If they work every Sunday during a month and a dozen nights they receive no extra pay for extra service; their wages amount to from \$1.05 to \$2 a day, according to locality, cost of living, etc.

Third. The laborers who assist track foremen, known as track hands, are subject to the foreman's orders; the foremen usually hire and dismiss them to suit their own convenience. According to the report of the Interstate Commerce Commission, they number about 150,000, but I do not think more than half that number are employed during the winter months. It is customary for the companies to employ several men on each section during the summer months to assist in putting the track in good condition while the weather is good, the days are long, and at the proper time to repair the road bed, and to discharge them in the fall. Many of the foremen are only allowed one or two assistants during the winter months, and in some instances they are required to lose several days each month, and the foremen are required to walk over their track alone.

The track laborers are usually paid by the day; they receive from 47½ cents to \$1.25 a day, according to locality, cost of living, etc. Think of it! More than 50,000 men work for the railway companies for from 47½ cents to \$1.25 a day during six months in the year, receiving barely enough to subsist upon during the time of employment, and in the fall of the year, when the cost of living is high and employment is hard to obtain, they are turned out to tramp, beg, starve, or steal and become criminals.

I do not doubt that your honorable body will have men before it who enjoy all of the necessities of life and many of the luxuries, and they will tell you things are all right as they are, and that the men in whose behalf I am speaking are Dagoes, Hungarians, Poles, Negroes, Mexicans, and Chinese, but in my opinion 90 per cent of these men are American citizens. They go to our polling places and vote, though I do not contend that they vote intelligently, but under improved conditions and more favorable circumstances many of them would become more useful and intelligent citizens, and add to our national strength.

Having related prevailing conditions among the men I am speaking for, as viewed from my standpoint, I will endeavor to explain what I believe to be some of the causes for the undesirable state of affairs.

Under our unrestricted competitive system almost every oppressor imagines he is being oppressed, and to some extent it is true, but the stronger members of society prosper under it, become rich and powerful, while the weaker ones are crushed, reduced to industrial slavery and abject poverty. The men who shape and determine the policies to be maintained by the different railway companies do not, it seems, understand the public, and the public does not understand them. Those who have invested their money in railway enterprises have done a great deal toward developing our country and advancing civilization, but without the aid and cooperation of the public our vast railway systems would be worthless to their owners; therefore railway companies, their employees, and the public should be on the best of terms. Transportation companies should not be allowed to discriminate against small shippers in favor of large ones; they should not be permitted to give millions of dollars' worth of transportation each year to men of political influence who are able to pay their fares, and then expect in return for it legislation favorable to their interests at the expense of the public. Such things arouse suspicion in the minds of the public, create prejudice, and are injurious to both. Rate wars between transportation companies should be abolished. A large per cent of their gross earnings, amounting to millions of dollars each year, is wasted in useless competition for business. I have heard men engaged in the ticket-brokerage business say that general passenger and ticket agents can not be relied upon to carry out agreements after entering into them. It is not an uncommon thing for them to meet and agree to maintain certain rates over certain competing lines to given points, and in less than three days for some or all of them to send agents to offer to supply them with tickets for less than the rate agreed upon. I can nearly always buy a railroad ticket cheaper from a ticket broker than I can obtain it from a company's regular ticket agent.

If the earnings of the road expended in this way were equally distributed among employees, it would enable them to supply themselves and families with the necessary comforts of life and abolish the causes for complaints on account of overwork and underpay.

In my judgment, the system under which the railways are operated at the present is having a demoralizing influence on the public. Were it possible to maintain present rates under judicious management, the earnings would furnish sufficient revenue with which to pay all employees living wages without requir-

ing any of them to work an unreasonable number of hours in any one day, and leave plenty of surplus with which to pay investors a reasonable per cent on money invested. As railway companies hold valuable franchises by consent of the public, and as they are semipublic enterprises, I have no hesitancy in saying it would be a blessing to all concerned if Congress would enact laws to create and authorize commissions to harmonize conflicting interests. Under the present system, employees having just grievances in many instances are afraid to make complaints or to unite with their fellow-workmen for the purpose of presenting their grievances in a proper manner. If there existed a commission before which all classes of employees, from the president, who presides over the meetings of the boards of directors, to the humble trackman, who drives the spikes and tamps the ties, could appear and present their grievances without fear of being discharged, a better understanding would be arrived at and a more just and equitable system could be adopted and put into practical operation.

As I understand your commission has been created by Congress to act as a mediator between the industrial workers and Congress, and as I desire to aid you in your laudable undertaking to the extent of my ability in my humble way, I will refer briefly to general causes, as I see them, which produce idleness and suffering among the toilers and wealth producers of the nation.

It should be understood that wage earners are not business men; they are capable of producing wealth, but depend upon others to provide ways and means. A demand for their labor must be created by the men who own the means of production and have possession of the things created by labor. Notwithstanding the majority of recruits to the United States Army were drawn from the army of unemployed, many of our citizens are in destitute circumstances and can not find employment; they can not sell their labor at any price. Such a condition is deplorable; it causes the citizen to degenerate and become a beggar, if not a criminal; degrades our Government, and weakens our national strength. Industrial panics such as we have recently passed through not only cause wage earners to suffer, but affect those who have possession of the wealth created by labor; they found no market for their products because the wealth producers, who should be the greatest consumers, were deprived of an opportunity to work and to earn sufficient wages to keep their consuming capacities anything like equal to their producing capacities. The natural result was commercial stagnation and industrial panic, which can not be traced to any natural cause. The causes were superficial—overproduction by some, underconsumption by others, and blind, selfish greed in others, who imagined that instead of creating wealth to be used by all, it should be created for gain for a small per cent of our citizens.

The change of conditions demands a change in methods. The young man in the East who has been crushed to the wall by competition, can not do as did the young man of a half century ago—"Go West and grow up with the country." Competition is as keen in the West as it is in the East; the land that was public a few years ago is occupied by settlements and cities to-day; our railways have been constructed, our cities have been built; machines that enable one workman to produce as much as was produced by ten a few years ago have been invented and are now in practical operation. The burden of public taxes upon the shoulders of labor (labor creates all wealth and pays all taxes) is increasing; the weakest members of society are found among the wealth-producing classes.

I ask the questions: Will our national representatives protect us against blind, heartless, and soulless capitalism? Will they be statesmen, protectors of equal rights, and saviors of our country by seeing to it that we are allowed to enjoy the things we need and are willing to work for in a country we have helped to develop? Or will they serve the class that wants more than they have any use for?

In my judgment, the questions your honorable commission is called upon to help solve are complex. It is hoped your time and energy will not be expended in theorizing, but that your investigations will enable you to see things as they are, for you have conditions to deal with that should and must be changed in order to preserve the rights of the people and to prevent the greatest nation on earth from retrograding.

Again referring to the men I represent and am authorized to speak for, I will state that there are about 200,000 carmen and shopmen employed by the railway transportation companies, whose conditions are but very little, if any, better than the conditions surrounding the men employed in the maintenance of way department. The trackmen, carmen, and shopmen, and their families are far greater in number than the entire population of the Island of Cuba. Our Government has expended many millions of dollars and sacrificed the lives of many of our citizens to aid the Cubans in their struggle to improve their condition, and I say unhesitatingly that before hostilities began on the Island of Cuba, the citizens of that Island upon the whole, were in no worse condition than are the men for whom I speak and who are citizens of the United States.

Q. (By Mr. KENNEDY.) Do the other brotherhoods recognize your organization, and are you federated with them?—A. We have no alliance with any other organization composed of railway employees or any other labor organization in the country.

Q. Do the men in your organization feel that they are neglected by the other organizations and that the other organizations do not do all they should in the way of bettering the poorer paid labor engaged in transportation?—A. I have heard members of our organization say the classes of railway employees that are well organized and are able to command living wages have become selfish and are unsympathetic; but, speaking as the chief representative of the organization, I will say that the members of other organizations have done considerable to encourage our people to organize by advising them and explaining to them how they could benefit themselves by entering into an organization, finding out what their grievances are, what they are entitled to, and how to contend for it.

Q. (By Chairman KYLE.) Is it the wish of your organization to be allied with these railway organizations? Do you desire to be connected with them?—A. I wrote Mr. Clark, the President of the Federation of Railway Employees, to know if an application from our organization for membership in the federation would be acceptable. He replied, saying that at that time they did not desire to extend the scope of the federation except to men employed in operating trains.

Q. On what ground did he take that position? Does he consider your class of workmen unskilled?—A. I will give my opinion. I believe that the only reason our organization is excluded from the federation is because it is young and has not done very much to show that our people are capable of self-government.

Q. (By Mr. KENNEDY.) What percentage of employees in the maintenance of way department of railroads are in your organization?—A. We have about 6,000 men enrolled. According to the report of the Interstate Commerce Commission there are about 180,000 men employed in the maintenance of way department. Our organization has only been in existence seven years, and we have not had time to give anything like the majority of our class an opportunity to become members of the organization.

Q. Is the ability of your members to support the organization very limited?—A. They are not able to pay very much.

Q. Are you personally in favor of governmental control of railroads?—A. Under our present partisan political system, no.

Q. You spoke about commissions adjusting matters and bringing about better conditions. Do you mean State and national commissions?—A. I think the Interstate Commerce Commission should be given more authority. It should be authorized to determine what the railway companies shall charge. I think their authority should be extended so they can require the railroad companies to charge 3 cents a mile if it is necessary to accumulate revenue enough to pay its employees living wages and the stockholders reasonable dividends.

Q. Are you familiar with the railroad pooling bill now pending in Congress?—A. I understand its objects.

Q. Are the railroad people generally in favor of that bill?—A. I think they are.

Q. Would such a law be a step in the direction of governmental control of railroads?—A. I suggested in my paper that a commission, with the authority to settle disputes between companies and employees and determine rates, should be provided by the Government, as the railroad companies are semipublic institutions.

Q. Have you beneficial societies that are promoted by the railroad companies?—A. When a member dies we pay his beneficiary \$1,000; if he is partially disabled, we pay him \$500; if he is totally disabled, we pay him \$1,000. We collect \$1 a month from each member to meet these demands.

Q. Do the railroad companies contribute to those benefits?—A. No; the railroad companies have never extended any favors to our organization, except in a few instances when we managed to get committees before the proper officers of the roads, and pictured our condition in such a way as to arouse their sympathy. In that way we secured an increase of a few dollars a month for each man.

Q. I see from a recent number of the Trainmen's Journal that they think the part of the arbitration law which forbids the companies compelling employees to go into these beneficial associations is a failure. They think those societies promoted by the railroads are injurious to their unions. Have you any such difficulty as that in your organization?—A. Some of our class of men have said that they would like to become members of the association, but they were compelled to carry insurance and pay for it in insurance associations gotten up by the companies, and with their small wages they could not afford to carry insurance in both societies. To some extent they are injurious, and especially to the beneficiary department of our organization.

Q. What I gathered from that journal is this: If a man seeks employment on a railroad the company will have no need for him unless an application for membership in its beneficial society accompanies his application, and that a man who is already an employee of the company knows that if he does not become a member of the beneficial society he is not in the line of promotion. I should like to know whether such a state of affairs affects your organization?—A. You mean to ask me whether the insurance societies that are maintained by the employees and managed by the company's officials affect our organization or not. Is that it?

Q. Yes.—A. To some extent, they do.

Q. (By Mr. RATCHFORD.) Are the men you represent covered by life insurance, or sick, or accident insurance that is compulsory, and of which the railroad companies are the chief promoters?—A. Some of them are.

Q. You know of such cases in existence at the present time?—A. All of the employees on the Plant System are. The Plant System officials require their employees to contribute to the company's beneficial department.

Q. Is it compulsory?—A. Yes; compulsory.

Q. Is the employment contingent upon their agreeing to it?—A. When a man makes application for employment, if he does not also make application for benefits at the same time his application for employment will more than likely not be noticed. In order to get employment, of course they apply for insurance in the company's beneficial society.

Mr. KENNEDY. The Trainmen's Journal says that is the way the new arbitration law is evaded; that they do not tell a man they do not want him, that he can not be in their employ because he is not a member of that beneficial society, but they ascertain whether he desires to become a member of it, and if he does not they have no employment for him.

Q. (By Mr. FARQUHAR.) You say you have 6,000 men enrolled in your organization?—A. Yes.

Q. And that it has been in existence seven years?—A. Seven years.

Q. And you made the statement that 180,000 men are employed in the maintenance-of-way department in the country?—A. Yes.

Q. What are your monthly union dues?—A. Three dollars a year—25 cents a month; and each member gets with his membership the monthly official organ without paying anything extra.

Q. Has that \$1 a month that you have for your benefit association covered the death losses at the rate of \$1,000, the partial injury at \$500, the total injury at \$1,000?—A. We have paid all legitimate claims and have a little surplus on hand out of the money collected at the rate of \$1 a month on the thousand.

Q. So that on the three classes of benefits your assessment of \$1 a month has been sufficient, with your organization of 6,000 men, to promptly pay policies, as they are called?—A. At a cost of \$12 a year to the insured members.

Q. Have you any knowledge of the differences of cost between your voluntary organization of \$12 a year to attain these benefits and the regular railroad insurance? What is the difference of cost?—A. I could not answer that question correctly, but in some instances they charge a little more.

Q. How much more, do you suppose?—A. From \$3 to \$8 dollars a year on the thousand.

Q. Have any of the railroad officials made any objections to your insuring yourselves instead of taking the insurance provided by the railroad companies?—A. The tendency has been to discourage men who might have become members of our association, and encourage them to accept employment and also insurance against disability, death, etc., in the associations managed by company officials.

Q. Do you think that possibly the railroad managers favor what you might call railroad insurance rather than the brotherhood insurance?—A. Yes.

Q. Are the men in your organization employed, as you might call it, locally; that is, are they people who live in villages or in hamlets by the line of road and have homes, or are they sometimes merely transient boarders?—A. A large per cent of the laboring class in the maintenance-of-way department are what you might term transient.

Q. Is there any change in the class of men employed as trackmen during late years?—A. During the last few years there has been a better class of men seeking employment in the track department. Mechanics and artisans employed in other lines of industry have been turned out and many of them have made application for employment on the track.

Q. Has the stress of circumstances forced skilled artisans to take the work if they can get it?—A. Yes.

Q. You say the lowest price is 47 cents a day?—A. Forty-seven and one-half cents.

Q. And extends to \$1.35?—A. Yes.

Q. At that scale of wages what is the character of their maintenance and living? Do they have places of their own where they hire rooms so as to get along as cheap as they can?—A. Some of them are men of families and the companies furnish little houses for them to live in. They are usually built near the track.

Q. (By Chairman KYLE.) Rent free?—A. Yes; rent free.

Q. (By Mr. FARQUHAR.) That is, they take an old box car or anything else that gives shelter, so as to have a home of some kind?—A. House them in different ways.

Q. (By Chairman KYLE.) On the Union Pacific road I noticed they employed Chinamen to a great extent; the company furnished a section house, in which the Chinamen lived and boarded themselves—furnished their own bedding and bought rice, and so on. I want to know whether that is customary to-day?—A. A few sections to-day on the Pacific coast are kept up by Chinamen and the companies furnish houses or box cars for them to live in. The foremen are Americans, speak the English language, and they have interpreters. They tell the interpreters what to have done and they instruct the Chinamen in their own tongue.

Q. (By Mr. FARQUHAR.) Do you know what the wages of those men are?—A. On the Union Pacific, I believe, they pay the Chinamen from 75 cents to \$1 a day, and the Americans are paid a little more—\$1.25.

Q. What is the length of service of the oldest trackman you have worked with and have known; that is, in connection with one road?—A. I have known men who have stayed on one section of track for forty years.

Q. You used the word "transient" before.—A. I was then referring to laborers. I never knew a laborer to remain on one section more than fifteen or twenty years.

Q. Are not those transients generally aliens?—A. Through the Middle States they are very nearly all Americans; on the Pacific coast and in the New England States they have a great many aliens—Chinamen and Italians—and through the South, including all of the Southern States and the Middle States from Colorado back this way, very nearly all are Americans.

Q. How strong is your organization in the South?—A. The bulk of our membership is in the Southern and Western States.

Q. Are colored men admitted?—A. Colored men are not admitted.

Q. Among the trackmen of the South and West is there quite a percentage of colored men in the service?—A. In the Southern States the majority of the laborers are colored.

Q. Have you any idea what wages they are paid?—A. The wages are smaller in the Southern States than anywhere else. Some roads pay as little as 47½ cents a day.

Q. Where in the United States are the most foreigners employed on track work?—A. On the Pacific coast and in the New England States.

Q. You still believe that 90 per cent are American citizens?—A. Yes; I think 90 per cent are Americans.

Q. Of your organization?—A. So far as our organization is concerned, they are all Americans. I believe 90 per cent, including all classes employed in the maintenance-of-way department, are American citizens.

Q. (By Mr. A. L. HARRIS.) Do you mean they are American born or naturalized Americans?—A. Some of them come from other countries, of course, and then become naturalized.

Q. Have you ever come across, in your investigations, anything bearing on the alien contract-labor question or the padrone system?—A. No, I have never come in contact with contract labor.

Q. Have you had many strikes?—A. We have never had a strike.

Q. Is it because your men are contented with wages and hours? Is that the reason you avoid strikes, or do you not feel strong enough to be aggressive?—A. I believe if we can get our people organized and teach them what their rights are and how to contend for them in the proper way, we can accomplish more for them than can be accomplished by engaging in strikes and causing the officials to become antagonistic to the purposes and aims of our organization.

Q. How about your hours; are there any set number of hours that your maintenance-of-way department men are required to work?—A. On some lines they work them ten and eleven hours a day and on others from daylight until dark. In fact during the time I was running a section I received instructions to the effect that I should be at the place where I was to work during the day by the time I could see how to work, and remain there as long as I could see how to perform work.

Q. Was there any payment for overtime?—A. The laborers are paid for overtime if they work nights or Sundays; but the class known as foremen do not receive any extra pay on any road that I know anything about, even if they work every Sunday during the month and a dozen nights.

Q. (By Mr. RATCHFORD.) Are the foremen eligible to membership in your organization?—A. Our organization is composed principally of foremen; in fact, until two years ago no one who did not fill the position of foreman was admitted to membership.

Q. (By Mr. FARQUHAR.) Do you know any way to shorten the hours of the trackmen?—A. Put on more men and work them fewer hours. To illustrate: Ten men will do as much work in eight hours as eight men will do in ten hours. During summer when the days are long and the men work fourteen hours, if the time they are required to work is cut down to eight hours, you see it would furnish employment for more than half as many more men.

Q. Do you think that your labor on the maintenance of the track, the general labor, is any more exhaustive than farm work?—A. Much more; much harder; yes. The handling of materials, cross-ties and heavy steel rails, with a few men; lifting heavy cars, all make it much harder than work performed by the agricultural worker.

Q. (By Chairman KYLE.) Have you ever worked on a farm?—A. I have worked both on a farm and on the track; yes, I was raised on a farm.

Q. (By Mr. FARQUHAR.) What proposition do you make in the matter of either shortening the time or advancing the pay of this laboring class that is working for 47½ cents up to \$1.25?—A. I should say if you reduce the hours you require those men to work and give them a little more time for intellectual development, and pay them a little more wages so they can supply themselves with the necessities of life, books, and other things necessary to intellectual development, they will become better citizens.

Q. Are there many who are anxious to take the places on the roads at 47½ cents a day?—A. I know of locomotive engineers, who have been receiving from \$5 to \$8 a day, who have accepted positions on the track for \$1.25 a day. I do not know of men who received very good wages going into the localities where the wages are so small and seeking those positions. In fact, I do not know of but one road that pays as low as 47½ cents a day; that is the C. F. and Y. V. Division of the Atlantic Coast Line. It is a road that runs through North Carolina, and the other roads that run through that section pay from 60 to 90 cents.

Q. Are there not enough of the unemployed near your roads who would fill the places, if you came into any struggle with the railroads, in order to shorten your hours or advance your wages? Are there enough of the unemployed to defeat your purpose?—A. Without the aid of public sentiment their places would be filled.

Q. Do you not also think a strong organization of other elements—the five brotherhoods—have in a measure helped you?—A. I believe that were it not for the influence of organized labor in the United States, the workingman would not receive more than 50 cents a day in any place in the United States. My opinion is based on the wages paid to men in countries where they have no labor organizations, such as Russia, China, Italy, Spain, Japan, and others.

Q. If you made an appeal to the managers of the railroads for an increase of wages or the shortening of your hours, would you be met with the general answer that has been given for twenty or thirty years, that the managers can find plenty of men to fill these places at the rates they are giving?—A. I have met managers who said to me, "We can get plenty of men to take the places if you people are dissatisfied." In turn I asked them if they did not think there was a principle of right involved in the wage question, and have always been successful in securing some concession for the men I represented.

Q. As a leader in your organization, knowing the men you have to deal with, knowing the roads that give the employment, what importance do you attach to public opinion and your organization in securing a remedy?—A. Without them we could not expect to be successful in our efforts to improve our conditions.

Q. Have you had, of late years, any raise of wages on any of the roads—on your brotherhood lines?—A. We have secured an increase of wages on eight or nine different systems and reduced hours on two or three.

Q. Were those roads in the hands of receiverships or were they in the hands of the owners?—A. Some of them were in the hands of receivers and some were not.

Q. Do railroad hands fare better in many ways under a receiver than under the corporations proper?—A. The receiver seems to be more liberal in the expenditure of moneys, allows a greater number of men to do a certain amount of work, and furnishes more material to work with than companies that are run independently by their own agents.

Q. And would that lead you into the argument that governmental control would be better still than the receivership?—A. I do not think I would advocate that the Government own the railroads as Government property at the present

time under our present system. I do think the Government should say how these enterprises should be managed; that the men who manage these roads should not be allowed to discriminate against shippers or passengers; that they should not be allowed to give away free transportation to buy the good will of men of political influence, and they should not be allowed to be governed exclusively by the organized bodies in distributing wages. Take a class of men that is fairly well organized; they are like a trust; they come very near dictating their own terms. Then take the other classes that are more illiterate, composed of the weaker members of society, and they do not know how to organize; they are simply at the mercy of the stronger members of society, and the company will raise the wages of the man who is already well paid, and take it away from the poor fellow who can not help himself and who is working for starvation wages to begin with.

Q. That may lead to the idea that the strongest organized union or brotherhoods of the country would always get the best wages.—A. There is no question in my mind that they will.

Q. Is the desire of your organization to make it thirty times as strong as it is now?—A. The object of our organization is to make better men, better citizens, and better conditions for the class of men the organization was established for.

Q. What is the success of your organization in seven years; are you advancing and increasing in membership and financial strength?—A. Personally I am proud of the record we have made during the past seven years. We have done a great deal to alleviate suffering and toward encouraging our people to make an effort to help themselves.

Q. (By Mr. KYLE.) Do the railroads encourage your organization, or do they look upon it with disfavor?—A. The railroads are very diplomatic, or the men that manipulate the affairs of the companies are. They fear force. They don't antagonize a strong organization, and they do not like to be placed on record as antagonizing a weak organization. At the same time, they will permit the little fellows to do it for them. For instance, the first class of men referred to in my paper are known as road masters. A few of them are members of our association, but they have an independent association of their own and meet annually. A letter was presented and read at one of their conventions, outlining the purposes for which our organization had been established, and requesting them to cooperate with us in our efforts to improve our conditions in a legitimate way; and one of them maintained that if they encouraged our class of men to organize, after a while, if one of them should want to discharge one of us, the organization would question their right to do so, and bring about an investigation; in other words, the organization could dictate to them whether they could discharge a man or not.

Q. When you have wrongs to redress, do you go to the road masters themselves or to the superintendents of the road, or where?—A. Well, in an unorganized state, the road master is considered the head of the department. General managers have said on the witness stand, Until the majority of a class become members of an organization they will not recognize the organization; that they would leave such things as adjusting grievances to the heads of departments. As we are in an unorganized state, you might say the road master discharges the men under his jurisdiction at will.

Q. Do the railroads blacklist members of your organization, as is sometimes done in the case of men called trainmen?—A. All classes of railroad employees are subject to the black list. A majority of railways have an understanding, and they have rules. To illustrate: If you have charge of a division of road, and they dismiss you for cause or without a cause, if you go to another road in search of employment, they will ask you where you worked last; did you get a clearance from that company? Unless you can produce a letter from your immediate superior on the line you have been working for, showing where you have been, what you have been doing, and that you have made a good record, the man that you make application to for employment would simply say, "I do not need any more men."

Q. Does that refer to the Chinaman, the Hungarian, the Pole, or whoever comes along that wants a job?—A. That does not go below the foremen in the roadway department.

Q. (By Mr. KENNEDY.) Is that letter written in such form that it is sometimes taken to be a notice of blacklist?—A. I have heard it said that they have certain private marks by which they understand whether the letter means what it says or whether it means the opposite.

Q. (By Mr. KYLE.) What are the chances for promotion in your line of work?—A. The chances to be promoted to a foreman, if a man is reasonably intelligent and energetic, are fairly good; but the chances to go higher than the position of foreman are not very good.

Q. Are the higher positions chosen from your ranks?—A. On some lines they are and on some they are not. A great many of our road masters are civil engineers, men who never worked on a track a day in their lives, and do not even know how to handle the tools used to keep the track in proper condition.

Q. Your observation is that railway companies desire to put that system in operation?—A. The tendency is to have all the positions that pay well filled by the engineer class and not the working class.

Q. (By Mr. FARQUHAR.) Do you mean what might be called the educated class?—A. The educated class.

Q. (By Chairman KYLE.) Is it the policy of the companies to promote brakemen to the positions of conductors?—A. I am speaking only of maintenance-of-way department employees.

Q. (By Mr. KENNEDY.) Has your organization petitioned Congress and State legislatures for the passage of anti-scalping bills?—A. I believe I have written a few personal letters in regard to that matter.

Q. Asking for the passage of such bills?—A. Yes.

Q. (By Chairman KYLE.) Against ticket scalping?—A. Asking them to pass legislation in opposition to the scalping system.

Q. Is not that in favor of the present anti-scalping bill that is before Congress?—A. I have not read the present bill before Congress.

Q. (By Mr. KENNEDY.) Have you said in your statement that you could always get cheaper transportation by going to the scalpers than you could by purchasing from the railroads' regular agents?—A. If I am going a considerable distance such is always the case.

Q. (By Chairman KYLE.) Can you do this and maintain your honesty and integrity in every instance?—A. I have even gone to the company's regular agent and asked him, "What is your rate to a certain point?" and he would state the rate. Then, upon stepping across the street and asking a scalper, "Can you save me anything on a ticket?" stating the point that I wanted to go to, I do not remember that at any time I failed to get a ticket for from \$1 to \$5 cheaper than I could have bought it from the company's regular agent.

Q. A legitimate ticket?—A. No name on it. In some instances the broker stepped over to the office and bought the tickets from the company's regular agent.

Q. (By Mr. KENNEDY.) The same office?—A. The same office I had asked for rates.

Q. You say you have petitioned Congress to pass such a bill as that?—A. I have written to members of Congress personally in regard to the matter, and have also spoken to them about it when I have met them at different places.

Q. (By Mr. RATCHFORD.) In the paper you have read you state, I believe, that there were 180,000 trackmen employed in the United States. By the word "trackmen" do you mean section men or section foremen?—A. I mean all classes employed in the maintenance of way department.

Q. Including foremen?—A. Including roadmasters, foremen, and laborers that work on track, bridges, etc.

Q. In addition to that now, you stated, I believe, that there were 200,000 men employed in the car and shop works?—A. Yes.

Q. That is 380,000. In one of your statements you say that 90 per cent of those men are Americans; that means 90 per cent of the whole, shop and track men?—A. In my judgment 90 per cent of the whole are American citizens.

Q. In speaking of transient employees in your paper do you refer to all of them—shop men, track men, etc., as transient employees?—A. Largely so, in all three of these departments; but all of those transient men are not foreigners or aliens; many of them are Americans. They work during the summer months in one locality and then roam looking for work during the winter months, and wherever they happen to be located in the spring of the year, they drift back on the track.

Q. Is the fact that they have become transients due, not to any fault of their own or to their own restlessness, but to the fact that their employment gives out at certain seasons of the year?—A. That is right.

Q. I understand that the employers' liability laws vary very much in the different States as regards the protection afforded railroad employees. We would like to have your views in that connection.—A. The fellow-servants laws in some States are very unjust to the railway employees. For instance, in the State of Missouri some three or four years ago a track walker was going over the track carrying his tools, looking to see that everything was all right and in proper condition so that life and commerce could pass over those rails safely. The company wanted to deliver a message to this track walker. They gave it to a locomotive fireman, who wrapped the message around a lump of coal, and in passing this

track walker on an engine, threw it off, striking him in the face and knocking one eye out, and he was not able to recover a cent for damages.

Q. Do the liability laws vary very much in the different States in the cases of men losing their lives in the employ of the company and in the discharge of their duty?—A. Very much, indeed.

Q. (By Mr. A. L. HARRIS.) What State has the best and most liberal laws toward the employee or the fellow-servant?—A. I can not answer that question.

Q. (By Mr. RATCHFORD.) Could you tell us what State has such laws as might be called the worst laws, from the standpoint of the workman?—A. I would not care to answer that question without referring to records concerning those matters.

Q. Ninety per cent of the people you represent being American citizens, you are not hampered very much in your business by reason of foreign immigrants?—A. Except on the Pacific coast and in the New England States.

Q. (By Mr. FARQUHAR.) What class of laborers are the graders and construction laborers? Do they affiliate with you?—A. Under our laws they would not be eligible to membership in our organization. The men who do the grading and constructing are made up of all classes, from all countries.

Q. (By Mr. RATCHFORD.) What are the relations between the roadmasters and section foremen to the men who perform the labor?—A. The relations existing between the roadmasters and the foremen are very harmonious. The foremen are very much oppressed on account of having but a few men to perform a great amount of work, and by being stinted with material, etc., but ordinarily they feel that the roadmaster is doing all he can for them, and the reason why he is not supplied with more men and material to carry on his work is beyond the roadmaster. The feelings of sympathy toward the poor fellow that works with his tamping bar and pick and shovel has not been such as I would like it to be.

Q. Has not been as strong on the part of the foremen?—A. Neither upon the part of the roadmaster or foreman as I would like to see it.

Q. Are the men who are working on the section obliged to work during bad weather, during heavy rain storms, etc.?—A. When they receive orders from the foreman to do work that should be done on the section, it is like receiving orders from a military officer, with this exception: they can either do what they are instructed to do or leave. Our objects are to create better conditions in our department and to induce a better element to come into our ranks so that we can have this class of work done with a more intelligent class of men; in fact, a first-class trackman must be a skilled workman.

Q. (By Chairman KYLE.) The ordinary trackman?—A. An ordinary trackman, to be considered first-class, must be a skilled workman. It will take him four or five years to be a first-class trackman.

Q. I understood you to say, a minute ago, that many of these men were unskilled workmen.—A. They are not first-class. They are what you might term make-shifts. The foreman often has a gang of men and not one of them knows how to drive a spike. He has to take his hammer and gauge and drive the spike himself. He has to get down and show them how to do it.

Q. (By Mr. FARQUHAR.) Are not your section bosses coming nearer the workman than they have been before, through your organization?—A. A better feeling between the men is being cultivated all round where the influence of the organization has been extended.

Q. Do you know a better way to maintain that sympathy than through your organization?—A. It is the only effort that has ever been made that has produced good results.

Q. Is it a fact that in the economical management of railroad beds, and the whole equipment, the necessary needs of the beds come from the men who are working below—the laborer—then to the section boss, then to the roadmaster, and then into the civil engineers' department, and that there is a unifying of all these interests on the road, and is it not becoming more so through organization?—A. It seems to be having a good effect.

Q. Is that the measure you would desire to carry out through the organization itself?—A. Yes; we desire to cultivate harmonious relations between all classes in our department.

Q. Does it come from a realization that the interests of the men are the interests of the road and the interests of the road are the interests of the men?—A. Yes.

Q. Why is it you do not find greater strength on the northern roads?—A. There has not been any effort on our part to extend the work of organization through that country. Our organization has not been in existence long. The organization not being in existence but a few years, we had all we could do at home.

Q. Have you any "organizers" at all?—A. We have four.

Q. What districts of the country do they cover? A. One of them is in Arkansas, two of them are in north Carolina, and one of them is in Florida at the present time.

Q. Was there ever any organization of what you might call the laboring part of the road—the track part of the road—in the North before you came up?—A. They have had local organizations, but they never accomplished anything.

Q. (By Chairman KYLE.) Do you think that railroad companies generally could afford to pay greater wages than they are paying for this class of work? Is that the opinion of your organization as a body?—A. I maintain that if the money that railroad companies seem to think they have to expend in competing with other lines was saved, and the free transportation they give away was sold for money, their incomes would be increased so that they would be able to pay living wages to all classes of their employees.

Q. You think it is bad management, then, on the part of the companies, of their own business affairs?—A. I think it is bad management on the part of the companies if their receipts do not enable them to treat all their employees as well as they treat some of them. They can increase their income by doing away with this unnecessary expenditure of money.

Q. You think the giving away of transportation, giving rebates in freight rates, etc., is one cause?—A. In other words, I think something should be done to protect railroad companies against themselves.

Q. What do you think about the salaries paid to the high officials of railroads? Do you think they pay too much for the salaries of presidents, managers, attorneys, etc., and too little to others?—A. I maintain that the money paid out for services by the railroad companies is not equitably distributed; some of them are paid more than they need and more than they are entitled to, and others are compelled to work for a great deal less than a man can work for and maintain himself in a manner becoming an American citizen.

Q. Do you think that the railways in issuing watered stock, etc., compel themselves to cut the rates of these workingmen?—A. I think every drop of water that has been poured into railroad stocks should be squeezed out.

Q. You think there is revenue enough, then, derived from freight and passenger traffic throughout the United States, to pay good living wages to every workingman on the railroads?—A. If the railroad business was properly managed.

Q. If they were paying interest on legitimate bonds and stocks?—A. There would be plenty of money to pay living wages to all men engaged in operating roads, and to pay the stockholders reasonable dividends on their investments, in my opinion.

Q. (By Mr. A. L. HARRIS.) Under the benefit insurance, which you say companies require employees to take in an indirect way, is the fact of insurance having been paid or due ever plead at law by the company in defense when an injury is sustained?—A. In some instances, they make the employee accepting a position agree that money paid in that way shall indemnify the companies or shall protect the companies from loss on account of personal injury, etc.

Q. (By Mr. A. L. HARRIS.) Is it a contract not to bring suit against the company in case of injury?—A. Yes; and when an employee is injured or killed and leaves a widow, if the company has two or three thousand dollars that belongs to her according to right of contract and for which her husband has paid, she feels that she should deal more leniently with the company, and it assists them in making compromises and settling claims for death or disability for less than they would under other circumstances. There is no doubt in my mind that these schemes are of great advantage to the railroad companies; they assist them in keeping their employees unorganized. The Plant System, for instance, has a man for general superintendent by the name of Denham, who organized an insurance scheme for the company. The locomotive engineers were induced by him to withdraw from their own organization and to take policies with the company, and I have been informed that no organization can do anything with any class of employees on the road. One of our organizers reports that he can not obtain members on the system on account of the men being compelled to insure with the company.

Q. Is it a selfish motive the railroads have in view when they compel the employee to insure? Is it for their own protection?—A. Men who are well paid in the different departments can simply request a man working for them to do a thing and he does it. You know, if you have had any experience with men working under you, that a request from an employer to an employee is almost equal to a demand. In that way they succeed in weakening the organizations, and at the same time reduce the companies' liabilities.

WASHINGTON, D. C., *March 3, 1899.*

TESTIMONY OF PROF. E. R. JOHNSON,

Of the University of Pennsylvania.

The commission met at 11.30 a. m., March 3, 1899: Vice-Chairman Phillips presided, and introducing Mr. E. R. Johnson, said he was a professor of transportation and commerce in the University of Pennsylvania.

Mr. JOHNSON. Mr. Phillips very kindly sent me a request to come over to meet the members of the commission this morning, and I came over with the supposition that I would be interrogated rather than give any formal discussion. I am not a technical man nor a practical transportation man, and probably my evidence will not be so useful to the commission as that of men of more practical training. My work during the last seven years has compelled me to acquaint myself with transportation literature. I have made two investigations for the department of labor, one on railway relief departments and one on the relief and insurance features of the brotherhoods, the latter being concerned with the brotherhoods as a whole, although emphasis was laid upon their relief features.

These studies have given me some insight into the railway organizations and their beneficial features. I have also followed during the last few years the work of the Interstate Commerce Commission. I notice that a good part of your outline deals with the work of State regulation. I may say that I have taken some interest in the studies which others are conducting on the subject of railway taxation, and perhaps the taxation of railways is a subject concerning which I have at least general information. Some years ago I prepared a monograph on inland waterways, which was published by the American Academy of Political and Social Science, and at that time I got some knowledge of water transportation. I say these things to you simply to indicate where the lines of my study have run, in order that you may interrogate me to better advantage.

Now as regards your outline, my first observation is that it is very comprehensive. I see the commission has in reality proposed to prepare a treatise covering the whole subject of transportation in all its various phases. I trust the commission will be able to carry out its plan. If it does I think it will result in the publication of one or more volumes that will be of use, not only to the legislatures of the States and to Congress, but also to every other student of the subject. The first part of your report deals with railway labor. I will say I think that the subject of railway labor in this country needs to be investigated, and it occurs to me that the United States department of labor ought to authorize some such a study of American railway labor as it has authorized and published on railway labor in Europe. I dare say all the members of the commission know that the Bulletin of the department of labor for January, 1899, contains a monograph of some 60,000 words in length on railway labor in Europe. It was prepared by Dr. Walter E. Weyl, a young man who has been studying with us at the University of Pennsylvania for the past three years. He has made a very valuable report, and what I think we now need is some such study for our own country as Dr. Weyl got out for Europe.

On page 4 of the outline it might be well to insert under "4" "And also a discussion of the recent laws of England and France." Part 4, as you will note, deals with "Extent of modification by statutes of common-law rule as to negligence of fellow servants; legislation of the States thereon, and effect thereof; statutes authorizing persons dependent on employee to sue for damages when the employee has been killed through negligence of railroad." That, it seems to me, is a very important part of the commission's outline, and I dare say the commission knows that in 1837 there was a decision of the English courts which modified the common law. In 1880 and 1897 there were statutes enacted by which the English law was very much modified in the interest of the employee. The Massachusetts and Alabama statutes, I believe, are copied after the English law of 1880.

Q. (By Mr. PHILLIPS.) What are the titles of your publications in the Bulletin of the department of labor?—A. One report was made in January, 1897, on Railway Relief Department, and another report on Brotherhood Relief and Insurance was published last July.

On the subject of automatic couplers, of course you won't expect me to make any observations; that question is well covered in the last annual report of the Interstate Commerce Commission; they have gone into the question thoroughly. We are all aware Great Britain seems about to adopt measures very similar to those we have adopted in this country.

Q. (By Mr. KENNEDY.) Did you investigate the question of relief associations from the standpoint of the employees themselves; did you go to them for data?—A. I got all my material from the secretaries of the brotherhoods.

Q. Did you find they were entirely satisfied with these relief societies which are promoted and in part sustained by the railroad companies?—A. No; they are not. There is some friction, indeed, between the relief features of the brotherhoods and the railway relief associations. Some of the railway companies having relief associations, three of them, until the passage of the arbitration law in 1898, made membership in their relief department compulsory; and in view of the fact that a majority of railroad men could not afford to carry insurance in the relief departments and in the brotherhoods, both the relief departments rather worked against the beneficial departments of the brotherhoods.

Q. Did it lessen their allegiance to the brotherhood organization?—A. Yes; and made it rather difficult for a man who was to be a member of the relief department to join the brotherhoods. For instance, a prominent official of an important railway corporation told me in a confidential conversation that he did not care whether the membership in the relief association was compulsory or not. At that time his railway made membership in his association compulsory; but he stated that he did not care whether it was compulsory to join the association or not, for the reason that the indirect pressure that the corporation could bring to bear would accomplish the same result.

Q. Did they force the employees?—A. Yes. From the testimony that has come to me I have come to believe that the employees of the corporations having voluntary relief departments feel rather insecure if they are not members of relief associations, because if it is necessary to lay off men, the men who are picked out to be laid off are the men who are not members of the association.

Q. (By Mr. FARQUHAR.) Will you explain the difference between relief and benefits proper of the brotherhoods and the railway departments, and name the prominent railways that have the beneficial associations.—A. There are six large corporations that have these relief departments: The Baltimore and Ohio, the Pennsylvania lines east and west of Pittsburg, the Burlington system, the Reading and Plant systems. The contributions to the relief associations are compulsory; that is, the contributions of members of associations are deducted from their monthly pay, and they range from 75 cents, in multiples of 75 cents up to, I think the highest is, \$3.75 a month, and the benefits which they derive from them are a death benefit, \$250 for a 75 cent per month payment, and then an accident and sickness relief, which ranges from \$1 to \$1.50 a day, beginning usually after the first week of illness. Three of these six corporations made membership compulsory until 1898. The brotherhoods provide in general for a considerably larger death benefit than the relief associations do, but the brotherhoods in their central organizations do not make any provisions for sickness and accident relief. That relief, however, is to a large extent accomplished through the lodges and divisions of the brotherhoods. Many lodges have a relief organization; that is, they have a distinct association for sickness and accident. I have made a report on a few of these lodges in my report to the department of labor, and I find that their members are getting as much relief in accident and sickness as members of the relief associations secure. I said that the central organizations of the railroad brotherhoods do not give relief in case of accident or sickness; they do in case of permanent disability, and sometimes in cases of sickness which results from any permanent disability, but the kinds of sickness are very carefully marked out. I tried to make a conscientious and perfectly fair comparison of the actual results of relief in the two organizations; that is, the associations which the corporations supported, and the associations which were entirely supported by the brotherhoods, and the results to which I came were practically negative; that is, the amount of effective relief accomplished is practically the same. I have given a comparative table in the Bulletin and my conclusions are based on the table.

Q. (By Mr. PHILLIPS.) Is that in the July, 1898, Bulletin?—A. Yes. The results of my study were that the amount of relief which the railway employee got was practically the same whether he got it from the brotherhood or from the relief association. I think, however, the employees get a great many advantages from the brotherhoods which they do not get if they are not members of the brotherhood, and the relief associations tend to prevent the development of the brotherhoods.

Q. (By Mr. FARQUHAR.) Do the railroads contribute to these relief funds at all, or is the draft made entirely on the wages of the employees?—A. They contribute what amounts to from 16 to 20 per cent of the actual expenses of the relief association. They contribute all the office expenses and the expense of managing the association; that is, the officers and staff of the relief departments are members of

the regular railway staff, and the railway relief association have full use of the facilities for telegraphing and railway mail. Furthermore, the railway companies also obligate themselves to make up any deficiency that may arise in settling the obligations which the associations assume, and some corporations have contributed substantially for this purpose. The actual contributions on the part of the railroads range from 16 to 20 per cent of the total contributions. In England the corporations contribute one-half.

Q. (By Mr. NORTH.) Is that a voluntary contribution?—A. Yes. I do not think, however, that the railroad corporations are necessarily more just there. A comparative scale of wages in England and America was gathered by Dr. Weyl.

Q. Are you able to give the commission information as to the uniformity in the wages which exists between the different parts of this country?—A. That subject is taken up in the annual reports of the statistician to the Interstate Commerce Commission.

Q. Have you an impression on that subject; that is, as to the causes of differences?—A. My impression on what data I have seen on the subject is that the differences are due to exactly the same cause in this country as in Europe, namely, that the wages in the railway service were determined by the conditions governing labor in the different parts of the country where railway men work. In other words, wages are fixed by the general standards that govern all classes of labor.

Q. Is that the operation of the law of supply and demand?—A. Dr. Weyl has compiled statistics from France and other countries showing that the general labor supply controls wages in the transportation as well as in other industries, and when we study the causes of differences in this country, I think we will find the same thing true.

Q. (By Mr. FARQUHAR.) Do you find, in your investigations of the benefit arrangements in lodges and brotherhoods, that within the last eight or ten years the rate has become very high because there is no new blood coming into the organization itself to sustain the association?—A. If you have the report here, I can show you just what the members have contributed per thousand dollars, insurance. You will find on pages 571-586, inclusive, Volume III, Bulletin, Department of Labor, a statistical presentation of the amounts contributed and distributed by the associations for a series of years. There is no evidence of a rising cost per thousand dollars of insurance carried. New blood is being taken into the brotherhoods rapidly.

Q. In some of those brotherhoods do the members have to carry two classes of insurance, one in the railway relief department and one in the brotherhood?—A. Some of them do, but the tendency is to forego the membership in the brotherhood if they are obliged to join the relief association.

Q. Are the assessments taken out of the wages anyway, one being voluntary and the other involuntary on the part of the men?—A. Yes; that is true.

Q. (By Mr. RATCHFORD.) Is the insurance which they secure through membership in the relief associations partly supported by the corporations usually termed compulsory by the railroad employees?—A. As I said a few minutes ago, in the case of three corporations it actually was compulsory until 1898, and from what I can find out, railway employees feel that they are not so secure without being members of the relief associations, even if it is not compulsory.

Q. Do you regard such insurance as being just to the employees?—A. I must say that if we have to choose between the two, as we apparently must to some extent, I should choose the brotherhood as being more just—the brotherhood plan rather than the relief department plan.

Q. What has this form of insurance, supported by the companies, to do with the employers' liability law? Are the employees, in connecting themselves with such insurance companies, not under obligation to exempt their employers from damages in case of accident or death while in the discharge of their duties?—A. You of course know that the rules of all the relief associations which are organized by the corporations have a contract clause in the rules by which a man signs away his right to sue for damages in case of accident if he accepts remuneration through the relief associations, and the general practice of the courts has been to hold those contracts as legal.

Q. Does not the use of the funds of the relief departments, together with other considerations, such as exemption from the liability laws, indemnify the company for the interest they have in the funds of that association?—A. I should answer unhesitatingly, yes. I think the corporations have organized the relief departments not from philanthropy but because it is good business. The railway companies, however, pay interest on the funds of the relief departments.

Q. (By Mr. KENNEDY.) Is it a fact that the railroad companies promote these insurance associations to be inimical to the railroad organizations; that it is intended in time of trouble, in the case of strikes, for instance, to place the railroad employee in a quandary as to whether he shall follow his union or remain with the company?—A. I agree with you that that has perhaps been the dominant motive. I think it would be unfair to the railroads, however, if we did not accede to them the desire to raise the morale of the service, and they certainly do raise the general standard of efficiency through the examination the employees are obliged to pass because of the relief departments. I think men like Dr. Barnard, who organized the first railroad relief association in this country, were men who were prompted by philanthropic motives, but I think the economic motive is the motive of the corporations. It does bind the employees to the corporations.

Q. I have just read Dr. Weyl's article and I notice that there are railroads in England that pension their employees. Do you know whether these pension funds are affairs of the company or whether they are built up by associations on the wages of employees?—A. In England they are a part of the relief associations and they are fathered by the corporation.

Q. (By Mr. PHILLIPS.) In the case of injury of an employee, are they as liable to bring action for damages against the railroad if they belong to this association?—A. They very seldom do it.

Q. (By Mr. FARQUHAR.) Can they do it if they have a contract?—A. If it is believed there is a good case against the corporation and more can be secured through the courts than from the death benefit, his heirs may decide to take the legal action instead of the benefit.

Q. (By Mr. SMYTH.) Are the brotherhoods incorporated? Is there any way in which an injured person could bring any action against the officials of the brotherhoods?—A. The brotherhoods are not incorporated, but the insurance association of the engineers is incorporated; that is the only incorporated body, I believe.

Q. Is the man who may be injured entirely at the mercy of the brotherhood? Do they pass upon it?—A. They pass upon it. I never observed any complaint on that score.

Q. What would be the condition of a man who has been sick a couple of months? Does the railroad still keep him insured?—A. Provision is made for that; a man may be absent from service for nine months without sacrificing his membership.

Q. If a railway engineer or fireman is sick and does not work for two months and receives no pay from the railway company, is he kept insured?—A. He has to keep up his assessments. Perhaps I do not understand your question. While he is sick and receiving benefits he makes no contributions. If, however, he is laid off by the railroad corporation temporarily, because they have restricted their labor force, he can continue his regular assessments and retain his membership.

Q. (By Mr. FARQUHAR.) Does he have to continue, then, whether employed or unemployed?—A. Yes.

Q. Is it true that there is some little advantage in the corporation insurance, as they call it, in this fact, that most of the railroads, after an employee is injured, say by the loss of an arm, so that he is incapacitated for hard labor, usually take care of that man by giving him a watchman's position, or some place which, under his disablement, he can fill?—A. It is customary to do that, and corporations make contributions which they are not obliged to make to aid their needy employees, men who have been in their service. This form of relief to injured employees is not confined to the companies having relief departments; it is the general practice. You will, however, find in the reports of the relief associations that contributions on the part of corporations to aid the aged are quite considerable. On the whole, corporations, as far as they can, manifest a desire to treat their employees so that the employees will feel that the corporation is fair to them.

Q. (By Mr. PHILLIPS.) I presume you have a very considerable amount of authentic information on this question that would be valuable to this commission.—A. I think if you will take my report as a basis of your investigation of railway employees' relief, together with the various secretaries' reports for the past year or two, you can bring my work down to date, and will have pretty much what you wish with one exception. I have not worked up in detail the smaller insurance and relief associations of employees that are connected with one system. For instance, there are in New England six associations, among them the Old Colony Association. The Lehigh Valley and the Great Northern Association are typical of those outside of New England. They represent a phase of the subject—of the support by the corporations of insurance and relief. These small

associations of employees are connected with only one road, and they usually are assisted more or less by the corporations, as in the case of the Lehigh Valley, Old Colony, Great Northern, and others that might be mentioned.

Q. At some future time will you give this commission an outline of what you think ought to be done to bring the investigation up to date?—A. I shall be pleased to do so.

Q. (By Mr. FARQUHAR.) Have you made any investigation as to the extent of the interest of the railroad employees in the corporations as held out by the Illinois Central?—A. I have followed in a general way the scheme of the Illinois Central, and am perhaps a little more familiar with the Pennsylvania savings fund and the Baltimore and Ohio building and loan arrangement. There are other corporations which have similar arrangements, but I have not the information in detail.

Q. (By Mr. SMYTH.) If an employee is insured both in the brotherhood and in the railroad beneficial fund, would he derive benefits from both in case of accident?—A. Yes. In the case of volunteer relief associations of the Pennsylvania Railroad type, you will find a large number of men who are members of both.

I should like to say just a word on the subject of rates in your outline, if I may pass to page 7. I would suggest that you put here before "21" a division devoted to the study of the general causes affecting railway rates in different parts of the United States. There has been a study of the causes affecting rates and fares made by Dr. Weyl. The study was published in the annals of the American Academy, and that article of some thirty pages in length, it seems to me, is a good and a clear analysis of the causes affecting rates and to some extent wages; but the question of wages has not been studied in detail, and I think it would be well to include in the investigation of the commission an investigation of those causes which obtain in different parts of the country, to see whether the railroad service in this country, as apparently it is in Europe, is subject to the same influences that affect the labor market generally.

Q. (By Mr. KENNEDY.) Have you anything to say under that head as to the effect of ticket brokerage upon railway employment and the railway wages?—A. I know nothing about that; I don't know whether it would be possible to trace any connection between ticket brokerage and railroad employment and railroad wages other than the general relation that ticket brokerage does undoubtedly decrease the receipts of the railway corporations somewhat, and to that extent it may have the effect of preventing them from paying as high wages as they otherwise would pay. Ticket brokerage does have some effect on the financial standing of corporations.

Q. The question I want to ask does not seem to be outlined: Do railroad companies share their prosperity with their employees? For instance, the C. B. and Q. R. R. has not within the past year, I understand, increased the wages of its employees. The stock of that railroad company the day war was declared with Spain was down to 88 cents. That was a low market. It is now in the neighborhood of 146. Is it a fact that the railway organizations or companies do not share their prosperity with their employees as a rule, and will not do it unless they are forced to do so by strong labor organizations?—A. I do not think the railroad corporation will increase wages beyond the ordinary scale unless it is compelled to do so under the influence of organized labor.

Q. (By Mr. PHILLIPS.) Do railroads in the hands of receivers pay the same wages as railroads that have very large net earnings?—A. Yes.

Q. Do those that are losing money or are not making money pay about the same rate as those that are making large profits?—A. The wages of the railway employees are fixed by the wages paid by other corporations, are they not?

Q. Calling attention now to 23, "Effect of watering stock and unnecessary additions to bonded indebtedness upon railway employment and railway wages." Have you any remarks to make?—A. It is usually said that the watering of stock or the unnecessary additions to bonded indebtedness do not affect the scale of wages paid or the rates charged by railroads. I question whether the statement in that form is true. In the long run, say in the course of twenty-five years, a corporation that has a very large capitalization will be able to secure for the owners of the capital a larger amount from the earnings than they would secure if the capitalization represented the actual value of the property. I think it can hardly be questioned that the public is influenced by the fact that railroads have very small earnings in proportion to capitalization. Dividends of a small per cent constitute an argument against State interference of any kind that imposes burdens upon a corporation.

Q. Have you information as to the amount of capital stock of the various railroads in the United States, and also about the actual cost of the same?—A. Nobody knows.

Q. Is there about one-third actual cash and two-thirds water?—A. You may find various estimates, we have nothing but estimates.

Q. (By Mr. A. L. HARRIS.) What becomes of the substance when water is put in?—A. Water means the capitalization of future hopes, and after these hopes are realized then the water becomes actual value.

Q. Are there not times when we consider that stock is water when really the companies are raising money to better their road, rebuild it almost?—A. Yes; and the additions in capital account may make the road actually increase in value. I do not think it is fair to call all new stock water, when the property does actually increase in value largely.

Part II takes up "Transportation by land in its relation to the public." Passenger travel in this country is relatively undeveloped. We are not large travelers. It is a common supposition that the Americans are extensive travelers, but the Europeans travel much more in proportion to the population. I published a short article in the Chicago Record last year, in which I brought out some of the figures regarding passenger travel. The figures disprove the common supposition that we are great travelers by rail in this country. What we need is not a better service, but a cheaper service in this country. I see that a move has been made by the Baltimore and Ohio Railway for cheaper sleepers, a move which is in the direction of cheaper service. When we get rid of ticket brokerage, as I think we shall, the railroads will be able to devote more attention to the excursion business and to offering special attractions for travelers, in some such manner as they do in Great Britain. In 1890 the reduction in rates in Hungary and Austria was followed by an immense amount of traffic, but there was very little travel before this change was introduced.

Q. (By Mr. KENNEDY.) Have you anything to say about the practice of giving passes, State laws prohibiting them, etc.?—A. I think it is something that ought to be prohibited by law. I think passes ought without exception to be restricted to actual employees of the railway corporations, and there is no doubt in my mind that the influences of the pass system upon our legislatures and judiciary are altogether bad.

Q. (By Mr. PHILLIPS.) Have you anything further to state in regard to ticket brokerage?—A. Nothing, except that, from the standpoint of the development of passenger traffic, it is to my mind essential that ticket brokerage should be done away with.

Q. (By Mr. KENNEDY.) Who should do away with ticket brokerage—the railroads themselves, or should it be done by national legislation?—A. I don't think the railroads themselves will be able to do away with it, unless they succeed in cooperating. There is nothing in the way of their cooperating excepting their own inability to do so, but that is quite sufficient.

Q. Is it their fault that the ticket brokerage system exists?—A. I think the railroads, as a whole, would be very glad to do away with ticket brokerage, but there will always be roads that will refuse to act with the others.

Q. Why do they refuse?—A. Ticket brokerage is one device used by competing roads to get business. The ticket brokerage is kept up, of course, as a part of a plan of discrimination. That is, the roads which have a desire to cut rates are really responsible for the maintenance of the ticket-brokerage business.

Q. Do not you believe there are greater evils that should be remedied by Congress?—A. I agree with you. I think the strengthening of the authority of the commission is of much more importance, but, personally, I shall be glad to see the ticket-brokerage law passed.

Q. (By Mr. PHILLIPS.) Has any member of the commission any question to ask under Division B, page 9?—A. There is a great mass of evidence on that division of your outline that has been collected during the last thirty years by the various reports, such as the Windom, Hepburn, and Cullom, and by the investigation of the Interstate Commerce Commission.

Q. We will pass to page 11. As regards question No. 36, "Reparation to individuals for damage from unjust discriminations, undue preferences, and unreasonable rates." There is no remedy, would be the answer, would it not?—A. Of course, if a man has been charged an excessive rate in the past he can secure damages equal to the difference between the sum he was charged and the amount he ought to have been charged; that is no real remedy for the damage he has suffered. He may have suffered a thousand times that damage. I am heartily in accord with the position taken by the chairman of the Interstate Commerce Commission. I should very much like to see the plan of regulation that is advocated

by the Interstate Commerce Commission put into law. It would probably lessen to a large extent the amount of damages the public would suffer from discriminations. The individuals who are discriminated against will always be unable to collect damages equal to the amount of their losses.

Q. (By Mr. SMYTH.) Is there no legal remedy?—A. No.

Q. (By Mr. PHILLIPS.) Do you think there should be a publication of freight rates?—A. Undoubtedly; I think this is the first thing to be done in railway regulation, and I should insist on full publicity of rates as the first requisite in railway legislation.

Q. Have you anything to say on "Joint traffic associations and pooling contracts?"—A. The University of Pennsylvania is going to publish a study on "Railway cooperations" that will contain some historic material that may be of service.

Q. How soon will that be out?—A. In a few weeks.

Q. (By Mr. SMYTH.) If the pooling system could be established under the authority of the Interstate Commerce Commission, would it result to the benefit of all classes?—A. I am in favor of trying it.

Q. (By Mr. PHILLIPS.) Under Governmental supervision?—A. Yes. I think the chief opponents of railroad pooling at the present time are the big corporations that are getting a satisfactory rate. I believe there are a great many factors affecting railroad rates, and if the railroads of the country are allowed to cooperate they will not be able to charge exorbitant rates. I don't anticipate exorbitant rates as a result of railway combination.

Q. What are your views in regard to the "Consideration or advisability of requiring all books and accounts of interstate railroads to be open at all times to inspection by United States examiners?"—A. I think that is a very important question, and I am decidedly in accord with Prof. Henry C. Adams. I regard the railroad service as essentially a public service, and see just as good reason for publicity of the workings of railway corporations as I do for banking corporations. I think publicity would be in no wise unjust to the railways, and would be of immense public advantage.

Q. On page 12: "Consideration of advisability of prohibiting by law the increase of stock by interstate railways without a governmental permit therefor, after application and hearing?"—A. I have given that question some thought, but it is a question with me whether Congress could accomplish anything; indeed, I do not know whether Congress could control the issue of stock. I am not lawyer enough to know whether Congress could actually control the stock of corporations chartered by the States. I dare say that members of this commission can answer that question. My experience of Massachusetts and Texas, as far as I can gather from official sources, seems to be in favor of such laws. The report of the Massachusetts commission, and the reports I have received from Texas, seem to indicate that the laws regulating stock issues are working well.

The study of "Railroad charters in various States" is one, I think, that ought to be made, and I hope the commission will lay some emphasis on that phase of its investigation. The subject has been taken up in a general way by Dr. Meyer, of the University of Wisconsin. He is making a special study of railways of the State of Wisconsin, and as a basis of his investigation he has made some study of the charters granted to railroad corporations in other States, in order to compare Wisconsin with the other States. We have suffered, of course, in this country very greatly from the variation of charter regulations and the vacillating policy followed by the States from time to time, and it seems to me a good deal of light will be thrown upon the railroad question by a careful study of railroad charters. We do not know very much about them. In 1850 or 1851 the charters granted by the six New England States were published in two volumes. They are in the office of the Interstate Commerce Commission.

As regards railway taxation, Prof. Henry C. Adams has a scheme for Federal taxation of railways instead of State taxation, which he has published in a recent number of the Review of Reviews.

Q. (By Mr. RATCHFORD.) Do you believe railroads should be taxed according to their net earnings?—A. I should be inclined to tax them on their gross earnings. A license tax, it seems to me, is the best of all. I think the States will come to that presently. Of course there are some States that have adopted that method. Wisconsin has, and Illinois has for a part of her railways. This is a sure way to collect the tax. If you resort to the general property tax for railroads, it results, as it does in my own State of Pennsylvania, in the railroads being taxed a score of different rates.

Q. (By Mr. SMYTH.) Would not taxation on gross earnings tend to decrease the betterments on the road?—A. If you made it so excessive as to be a burden. The

amount of the burden imposed by the tax depends upon whether it is a tax that the roads are able to shift on the travelers and shippers. Probably it is not a tax that they can shift, because the rates and fares are largely controlled by factors over which the railways themselves have only a small control; consequently when you put a tax burden on a corporation such as a railway, the burden rests there.

Q. (By Mr. A. L. HARRIS.) Would you use the entire funds arising from the tax for State business, or would you distribute it pro rata among the counties through which the road passes?—A. That is a question to be determined by local conditions.

Q. (By Mr. FAIRCHUR.) Has a State granting a charter to an original company which ultimately went beyond the bounds of the State, a right to assess the whole property? Take, for instance, the Pittsburg and Fort Wayne road, having an Ohio, Indiana, and Illinois charter. Have any of these States the right to assess on the whole property of the system?—A. I have not carefully studied the decisions of the Supreme Court in the Ohio tax case, but as I understand these decisions the States have a right to tax property within the State only. The Ohio law, however, places a very liberal interpretation on what is in the State, and the Supreme Court has upheld that interpretation, I believe. Dr. Howe, of Cleveland, has recently sent the American Academy of Political and Social Science at Philadelphia a paper on the taxation of railways in Ohio. The paper will soon be published.

Taxation upon business done opens a large field for taxation, of course. In Kentucky and Indiana the laws are similar to the Ohio law. I regard transportation as a legitimate object of taxation.

Q. (By Mr. PHILLIPS.) Would you tax express companies, sleeping-car companies, etc.?—A. All forms of transportation I regard as legitimate objects for taxation. I am of the opinion that we will get the same kind of transportation if we impose upon the transportation companies the ordinary tax that we impose upon property generally.

Q. Have you any information to give in regard to the history of injunctions?—A. That question opens a large field for discussion—the question whether or not it is desirable to limit the common law by statute regarding the use of the injunction. I am inclined to think we shall decide to place some limitations by statute upon the common law in regard to injunctions. I do not pretend to be lawyer enough to form a definite programme.

Q. (By Mr. RATCHFORD.) Do you believe the issuing of injunctions in case of strikes of railway employees is adopted by corporations to aid them in reaching their ends?—A. Yes.

Q. Do you find they are intended for that purpose?—A. Yes. The corporations that pray for injunctions have found the injunction a very efficient means of accomplishing their ends.

Q. Is it not a fact that the transportation of the United States mails very largely assists corporations in obtaining those injunctions?—A. Of course it does.

Q. I should like to have you explain wherein the United States mails are interfered with and to what extent, and a comparison between the transportation of mails in the United States and in foreign countries, where the injunction is not so freely resorted to—in England, for instance?—A. I am afraid I do not possess the information necessary to answer your question. This much I do know, that the railroads attach mail cars in the case of a strike to as many trains as possible in order to avail themselves of the protection of the national laws in regard to carrying mails, and probably they have abused their privilege in that regard.

Q. (By Mr. PHILLIPS.) We would like to hear from you concerning transportation by water.—A. I think the commission will have great difficulty in getting hold of any really accurate and reliable information in regard to transportation by water. The statistics are collected only in part, and those that are collected are notoriously inaccurate, so that I do not anticipate, if I may be frank, that the commission will be able to secure very much reliable data in regard to inland transportation. The statistics of the transportation on the Great Lakes, prepared by Mr. Tunnell and published by the United States Treasury Department, is a very comprehensive study, but I understand that the author had to draw his statistics from sources which he found to be extremely inaccurate. We have very incomplete statistics of our traffic by rivers and canals, and they are by no means accurate. In regard to the relation of rivers and canals to railway commerce, it seems to me that the Interstate Commerce Commission is right in its recommendation that carriers by water as well as carriers by rail should be obliged to report to the commission, and that all carriers should be subject to a like degree of regulation. Probably there should be some action by law to prevent the freezing out of competing steamship lines that is resorted to on the part of railways. Of course it will have to be more than simply a prohibition, such

as the State of Pennsylvania has put in her constitution, and which has been a dead letter. I do not think the day of water transportation is altogether past. I think that carriers by water will play an important part in our transportation business in the future, even in competition with the railroads, but the traffic will have to be carried on more highly developed and more efficient waterways than those that were constructed thirty or forty years ago.

Q. (By Mr. A. L. HARRIS.) Do you refer to the canals?—A. Yes, and to the improvement of rivers. The time of the strictly barge canal is very nearly past. Large barges of several hundred tons are being built, and will continue to carry an important part in our traffic on the larger natural and artificial waterways.

Q. (By Mr. PHILLIPS.) Have you anything else to say to the commission?—A. My monograph on inland transportation contains considerable information that may be of interest to the commission.

WASHINGTON, D. C., March 16, 1899.

TESTIMONY OF MR. FRANK P. SARGENT,

Grand Master of the Brotherhood of Locomotive Firemen.

The commission met at 11 a. m., Vice-Chairman Phillips presiding. Mr. Frank P. Sargent, Grand Master of the Brotherhood of Locomotive Firemen, testified.

Mr. Sargent presented a paper signed by the chiefs of the five railway organizations, the same being in answer to Part I of the syllabus on transportation, which was read by the secretary, as follows:

MARCH 10, 1899.

WM. E. SACKETT, Esq.,

Secretary Industrial Commission, Washington, D. C.

DEAR SIR: We hand you herewith answers on our part, as representatives of our organizations, to the questions propounded in the syllabus of inquiry relative to transportation, sent out by the Industrial Commission. We have hastened preparation of this, and hand it to you in a less complete form than it would otherwise have been made because of the seeming anxiety on the part of the commission to get some evidence or information from us. As indicated in the answers, we shall expect to supplement them with definite information which has been sought and which at the present writing is not at hand.

Yours, very truly,

P. M. ARTHUR,

Grand Chief Brotherhood of Locomotive Engineers.

F. P. SARGENT,

Grand Master Brotherhood of Locomotive Firemen.

E. E. CLARK,

Grand Chief Order of Railway Conductors.

R. H. MORRISSEY,

Grand Master Brotherhood of Railroad Trainmen.

W. V. POWELL,

Grand Chief Order of Railroad Telegraphers.

Answers on part of the Brotherhood of Locomotive Engineers, Brotherhood of Locomotive Firemen, Order of Railway Conductors, Brotherhood of Railway Trainmen, and Order of Railroad Telegraphers to questions propounded in Topical Plan of Inquiry of Subcommittee on Transportation of the Industrial Commission.

First. The employees in branches of service represented by the above-named organizations are quite generally employed at rates of compensation and under terms of employment mutually agreed upon between the officers of the railway company and committees representing the men. In addition to these rules, the men are subject to the rules of the company relative to movement of trains, conduct of men, and care of property intrusted to their care.

The basis of pay for engine men and for train men in freight service is the number of miles run, with a minimum allowance as agreed upon. Train men in passenger service are generally paid by the month, although on many important roads they are paid by the mile or the trip. There are certain rates which are recognized as standard and which are in force, or are very closely approached, on all important lines west of the Hudson River and north of the Ohio River,

and west of the Mississippi River. The standard for engineers in passenger service is 34 cents per mile; in freight service, 4 cents per mile; for firemen, is 58 per cent of the engineers' pay. The standard rate for conductors in freight service is 3 cents per mile; for brakemen, 66½ per cent of the conductors' pay. Passenger conductors get from \$100 to \$125 per month, and passenger brakemen from \$50 to \$70 per month. The standard pay for yard foremen is 27 cents per hour for day work and 29 cents per hour for night work, and for yard switchmen is 25 cents per hour for day work and 27 cents per hour for night work.

In the Southern States colored men are used a great deal as firemen and brakemen. This practice has a strong tendency to unfavorably affect the rates of pay of men on neighboring roads, for the colored men work much more cheaply than white men could be induced to or than they could find it possible to do.

Telegraphers, train dispatchers, and station agents are generally paid by the month, and it is but of comparative recent date that the unfavorable and unsatisfactory conditions which have surrounded them in their work have been ameliorated to an appreciable degree. The rates of pay in this service varies with the importance of the station at which the men are employed.

The standard rate for train dispatchers is \$125 per month, working in 8-hour tricks. The standard for station agents and telegraphers is fixed by establishing a minimum salary, and adding thereto as is proper in consideration of the responsibility assumed and the work performed. The pay of station agents and telegraph operators runs from \$40 to \$85 per month.

As a rule, the rates of wages are quite stable, the wages of the men who work by the mile or the trip being affected by the volume of business. Some few reductions in rates were made during the business depression of 1893-94. The earning power of the whole was seriously curtailed by the great falling off in the volume of business.

A few railway companies conduct relief associations for their employees and deductions from the wages of the employees are made therefor. In some few instances hospital associations are conducted on similar plan and deductions for their support are made. The practice of fining men for breakages or minor offenses has been practically abolished in deference to the wishes of the employees.

Men are discharged for violation of rules, responsibility for accidents, insubordination, intoxication, dishonesty, and occasionally for incompetency. Suspension from duty without pay is frequently made as a punishment for the less flagrant offenses. The plan of keeping record of men's conduct by a system of merit and demerit entries has of late quite generally taken the place of suspension as punishment.

The practice of blacklisting employees was for some time indulged in to a great extent. Vigorous laws, both State and national, have put a stop to the practice of voluntary blacklisting. The practice generally followed now is to require from the men entering the employ a statement of his former experience and employment, and to inquire from his former employers as to his leaving their employ. This practice has, in reality, the effect of the old blacklist, while at the same time it does not render those who follow it amenable to the law. A great many companies give the employee a service letter upon his leaving, which letter shows his term of service, character of services rendered, and cause for leaving. Through the influence of the organizations unjust or unreasonable dismissals and suspensions are becoming fewer in number and fewer in proportion to the whole.

We do not know of any specific instance in which it has been openly sought to compel men to work for a railway company against their will, by the exercise of the power of the courts through the channel of injunction, except when Judge Jenkins of the Federal court in Wisconsin enjoined the employees of the receivers of the Northern Pacific Railway from quitting the service of the receivers, with or without notice, in such manner as to hinder the operation of the road. Motion was made to modify the injunction in this particular, and was denied. Appeal was taken to the United States court of appeals and Judge Jenkins' decision on the motion to modify was reversed.

In connection with some troubles between the engineers and firemen and the Toledo, Ann Arbor and North Michigan Railroad, some orders were issued by Judges Ricks and Taft of the Federal courts which were believed to be intended to force men on that or other railroads to continue in the performance of their work even against their will. If additional information in this connection, which we are seeking, is secured, it will accompany this or be handed the commission later. The issuance of writs enjoining men from taking concerted action in leaving the employ of an employing railway company or to use proper and peaceable means to induce others to leave or to refrain from entering the service of such employer, and the punishment of men for contempt under strained interpretations

of the actions and intentions of the men is wrong and should be made impossible by United States statute. The criminal code provides prohibition of, and punishment for, criminal acts. The code should be depended upon rather than to permit one judge to decide one way and another to decide in direct contradiction therewith. We are hardly competent to discuss this subject from the standpoint of one well versed in law, but we are well satisfied that a thorough study of it will convince the commission that the powers of the courts have been misused and abused in these connections and that it will be well to limit by statute their power, to the end that the dignity of the courts as well as the rights of the people may be preserved.

Second. Road, train, and engine men have little or no complaint as to hours of service. They are generally paid for all excess hours and the necessity for their being wide awake acts as a protection against unreasonable demands upon them. Ten hours for 100 miles is the standard rule in freight service for road men. Yard men are frequently required to work 12 hours for a day, which we consider as excessive when compared with the requirements in other occupations. The number of hours for these men should be but 8, and certainly not over 10. The telegraphers have much to complain of in this direction, as they are frequently required to remain on duty long hours.

Train and engine men, as a rule, are paid overtime on a very fair basis. Telegraphers are allowed overtime on many roads, but on many more they are not. Twelve consecutive hours is considered a sufficiently long day for them, and in our opinion telegraphers who, having worked 12 consecutive hours, are called for duty during the next succeeding 12 hours, should be allowed extra pay for time so used.

Third. Sunday work is compensated for at the same rates as if performed on any other day. The running of trains on Sunday should be abolished as far as is practicable.

Fourth. Fellow-servant laws, under which the employing railway company is liable for damages for personal injuries sustained through the neglect or incompetence of fellow-servants, have been enacted in several States, among which are Texas, Missouri, Wisconsin, Florida, Georgia, Iowa, Kansas, Massachusetts, Minnesota, Montana, and Ohio.

The effect of this has been the collection of damages in many cases where otherwise it would have been impossible, and we hope the effect has been or will be to induce the companies to be more careful in the selection of men, and the men more careful of their fellow-employees. We would prefer to prevent the injuries rather than to secure indemnity therefor. The men have no choice as to who their fellow-employees shall be. All are selected by the officials of the company, and hence the company should assume responsibility for their acts. Railroad companies have recently adopted, with practical unanimity, the requirement of a searching physical examination of all applicants for employment, under which the man who has suffered amputation of a portion of a hand or foot, or who has suffered from some other injury while in the service of some railway company is refused employment by other companies. If a man who has sustained such injury, which in reality does not prevent or hinder him from performing in an able manner the duties of his position, or who has attained a certain age which leaves him the prime of life yet to be lived, is to be refused employment under the operation of a rule adopted in concert or contemporaneously by the railroads, it seems but fair that the employee should look to the railroads for compensation for his injury, or pension for his age.

We believe it to be the generally accepted rule that persons dependent upon an employee may sue for damages on account of the death of such employee through the negligence of the railroad company, and if such negligence be shown may recover.

Fifth. The generally accepted doctrine of risks contemplated by voluntarily engaging in dangerous occupations has, we believe, been upheld and the companies held to be free from liability if the injury or death was clearly shown to be the result alone of such natural risks, or of contributory negligence on part of the injured.

Sixth. We do not know of any limited liability legislation which applies to railway employees in any manner different from that in which it applies to all others. We have as yet felt no serious effects from this source.

Seventh. Beyond a reasonable desire to get as much service as practicable from material or appliances on hand, the railroads generally provide adequate and proper appliances. In instances where this is not done, liability should very properly attach to the negligent company.

Eighth. The employees in the departments represented by the names of the

organizations on whose part these answers are submitted have very thoroughly organized associations, one feature of which is insurance of members against death or total disability. The insurance is furnished the members on the mutual assessment plan and at actual cost. Members are insured in sums ranging, at their option, from \$400 to \$5,000. The only conditions imposed upon the member are that he shall remain a member and pay all assessments in accordance with the rules. The sums already paid out for these purposes by these organizations aggregate, in round numbers, \$20,000,000. Temporary sick or disability benefits are provided by many local branches, and in that way many millions more have been distributed among the needy members.

Ninth. Relief associations, ordinarily termed "voluntary," are maintained by a few railway companies. Employees contribute, through deductions from their earnings, to such association and receive certain sick and other benefits, as provided in the rules. The companies contribute something to such relief feature, but a careful comparison shows that the sums paid by the individual employee fully covers the cost of carrying his risk. The term "voluntary" as used in the name of these associations is a misnomer, as, in fact, if an applicant for employment does not signify a willingness to participate in such association he is not given employment.

The number of railway companies conducting such associations is not large and their number does not now seem to be increasing. This is undoubtedly due very largely, if not entirely, to the bitter opposition on part of the employees to the establishment of such associations. They object to such paternalism being exercised over them by their employer; they object to paying for such protection only to have all sums paid in forfeited at any time when they may find it necessary or desirable to accept employment elsewhere, or when the company sees fit to dispense with their services; they object to paying full value for the insurance granted and then having the acceptance of the benefit for which they have paid operate as an effectual bar to their recovery for personal injury under the common law.

The maintenance of such associations by railway companies is generally obnoxious to the employees and is generally looked upon by them as an effort on part of the employer to secure a species of domination over the employee and his acts.

Tenth. We can best answer by referring to the proceedings of hearing had before the Interstate Commerce Commission in January, 1898, on petition from various railway companies for an extension of time within which to comply with the provisions of the law requiring the use of hand holds, power brakes, and automatic couplers. The Interstate Commerce Commission issued at that time a table of statistics, showing the percentage of cars and engines then equipped. Further authentic information on this subject is found on pages 86 and 87 of the Twelfth Annual Report of the Interstate Commerce Commission.

As to the cost of these appliances on old cars, evidence varies. It is more expensive to apply them to some cars than to others, dependent upon the construction of the car. We do not think, however, that the cost of attaching them to old cars is an important question any longer to a road which has made any reasonable effort to comply with the provisions of the law. The capacity of cars has been multiplied of late years, and if the new cars put in service since the enactment of this law have been properly equipped, the number of old ones which will be fit for use in interstate traffic after January 1, 1900, the date to which the Interstate Commerce Commission extended the time within which railway companies might comply with the law, will be very small.

As to the cost of putting these appliances on new cars, we find that the evidence varies. The manufacturers are unwilling to make estimates of the cost of putting the appliances on the cars, explaining that the several ways of putting them on make it difficult for them to determine. The cost of first-class vertical-plane couplers, f. o. b. at the factory, is from \$12 to \$18 per pair. To this cost must be added about \$1.50 per pair for uncoupling rods, their brackets, lag screws, and labor to apply them to a new car. To this again must be added the freight on the couplers.

The first cost of material to be applied to an old car is the same, but whatever is realized from the sale of the old coupler and its links and pins for scrap iron should be deducted from the estimate of the cost of equipping an old car. It has been stated that the cost of changing from the old link-and-pin coupler to the vertical plane is from \$25 to \$40 per car. In this estimate is included the renewal of draft timbers and center sills or adding heavier and more expensive draft rigging. This does not seem to properly belong in this account, for the old and light capacity cars are unfit for use among the modern heavy and large capacity cars or for hauling with the modern giant locomotives with the old draft rigging. This rigging would probably have to be changed in order to use the car, whether

automatic couplers were used or not. Exact and reliable detailed information on this subject can best be secured from master car builders or superintendents of motive power and machinery.

The Westinghouse quick-action air-brake apparatus for freight cars is sold at \$35 per set, f. o. b. at their works, and a rebate of 15 per cent is allowed all holders of a certain agreement with this company under which 95 per cent of the purchasers buy these supplies. This makes the net cost of this apparatus for a freight car \$29.75. If an old car requires new foundation brake gear, the cost of putting that in and applying the air-brake apparatus is in the neighborhood of \$20. If the existing foundation brake gear is substantial enough for use with air brake, the cost of applying the apparatus should not be more than \$5.

The main reason given by railroad managers for failure to complete the equipment of their cars and engines within the time fixed by law was the financial embarrassment caused by the panic of 1893 and desire to get what wear they could out of rolling stock not worth equipping.

Eleventh. Is best answered by figures given on page 88 of the Twelfth Annual Report of the Interstate Commerce Commission, to which we respectfully and proudly refer.

Twelfth. We have, at this time, nothing to recommend.

Thirteenth. There are many organizations of employees other than those for whom we speak. We will confine our statements to our own and the others will undoubtedly speak for themselves.

Our organizations are of the trade-union nature; that is, each composed of the men in a particular department. Their purposes are to obtain and retain fair and reasonable compensation for services performed; reasonable hours of labor and pay for excess hours; reasonable and fair conditions of employment; to protect against injustice to members; to elevate the profession; to exert a healthy influence upon legislative matters affecting the interests of those who make up the organizations, and to afford financial aid to the afflicted members, the widows and the orphans; and to furnish out of work benefits to members legally engaged in a conflict with their employers. The effect of their efforts has been widely and generally successful. They have accomplished to a great degree the purposes sought.

Of the number of employees in the departments represented, probably 80 per cent are members.

These organizations do not undertake to control their members except by requiring them to conform to the lawfully expressed will of a constitutional majority, which will of the constitutional majority governs in all things.

They do not interfere with the employee who is not a member, nor with his right to work. They depend upon their standing, reputation, and works to attract to them all worthy and well-qualified employees.

Copies of the laws of our organizations are handed you herewith.

Fourteenth. Disputes of a serious nature are generally over the rates of compensation or an effort to impose some condition of employment which is considered unjust or unfair.

Fifteenth. So far as we are concerned, strikes are caused only when all other means of reaching an adjustment have failed and a principle is involved which can not be surrendered.

If a strike is decided upon, it is put into effect by withdrawing the members from the service of that employer, leaving him free to replace them with such as he can get or to make terms under which his old employees are willing to return to his service.

The effect of a strike is generally measured, so far as the principals therein are concerned, by the degree of success which either attains. Strikes are not desired either by the railway companies or the railway employees. On the whole, and taking into consideration the moral effect, the railway employees believe that much good has come to them as a result of their protective policy and the actions which they have found it necessary to resort to thereunder.

Sixteenth. A strike consists of the concerted and peaceable retirement from the employ of a certain employer on part of certain of his employees, leaving said employer to get along as best he can without them. A boycott is an effort to injure the employer or his business in other ways, such as seeking to induce as many as possible to refrain from patronizing the employer or his business, pending the settlement of the dispute.

Seventeenth. We are strong advocates of the practice of applying the principles of conciliation, mediation, and arbitration to the settlement of any differences between railroads and their employees. We earnestly sought the enactment of the bill approved June 1, 1898, entitled "An act concerning carriers engaged in interstate commerce and their employees," a copy herewith submitted.

Our experience with arbitration has been such as to commend it to our favor. We are at all times ready to accept it in its full spirit as a means of settlement of disputed points. Its effect, where tried, has been to establish more firmly feelings of confidence between the men and the officers in charge.

Eighteenth. If the laws are construed and applied in the spirit intended by the lawmakers, we have no criticism or suggestions to offer. Strained constructions and abuse of power under mandamus or injunction proceedings should be made impossible by legislative enactment.

Nineteenth. Under our acceptance of the term "arbitration," its whole virtue and vitality would be destroyed by making it compulsory. If made compulsory, permanent boards would probably be a necessity, and the objections to that practice are too obvious to invite discussion.

Twentieth. The use of intoxicants by railway employees is a practice which has very rapidly grown less of late years. Our organizations use every possible influence against it, and with great success. Strict rules have been adopted by many railway companies on this subject, and they are generally observed carefully by the employees.

It follows, without argument or room therefor, that the less the railway employees use intoxicants the better off they are from every standpoint of view.

Twenty-first. Railroads have but one commodity to sell, viz. transportation. The merchant who offers two or more lines of goods can, in competing with other dealers, sell one line at, or below cost, and possibly recoup himself on the other line or lines. The moment a railroad company begins carrying goods or passengers at less than the cost of the transportation furnished a condition is created under which the company must make up the loss by discriminating against other patrons or localities, by recovering the loss through economies practiced at the expense of the physical condition of the property, the character of the service rendered, or the employees, or by quietly charging the loss to the profit and loss account. If the first alternative is followed, the text and the spirit of the laws of the nation are violated; if the second be chosen, either the public or the employees are made to pay for losses unnecessarily and inexcusably sustained; if the last be adopted and followed to its logical conclusion, bankruptcy must come with all its attendant ills. Competition in railroad rates is simply ruinous. Most absurd lengths are gone to in a reckless underbidding of one another with an utter disregard as to how far the rates quoted may be below the cost of the service.

While we can not now point to specific cases of the wages of railway employees having been unfavorably affected as a direct result of rate wars or unrestrained competition, we can clearly and easily see how such evil effects to the employees may reasonably be expected to follow such unrestrained competition. If the practice of accepting business at a loss is continued, after all other economies have been inaugurated the wages of the employees will naturally become the object of consideration or attack. It is, and shall be, the purpose of our organizations to resist any reductions in the wages of the men, but we do not think it necessary or even pardonable to bring about a contest or a conflict on that point through such seemingly senseless rate wars as have been indulged in by the railway companies. While opposing the introduction of rates by commissions on the ground that they were so low as to be ruinous to the companies, some of the companies in connection with their competitive rate wars have put in force rates so low as to put to shame anything proposed by anti-railroad legislators or commissioners, rates which the veriest tyro would recognize at a glance as far below the actual cost of the service rendered.

It appears that Congress found it necessary, in order to prevent unfair discrimination, to exercise its right to control interstate traffic and to put a stop to arrangements or agreements between the common carriers under which certain rates should be maintained. It appears to us that there is just as much unfair discrimination possible and practiced under unrestrained competition as was, or could be, under pooling arrangements or traffic agreements. We have been of the opinion that the Government should be very careful in exercising or extending its right of control of the railways; but if the railway officers themselves can not, or will not, prevent such ruinous and disastrous wars under the guise of competition, the Government should assume the role of guardian for them, and in the interests of the shippers, the dealers, the traveling public, and the railway employees, take such steps as may be necessary to establish and enforce a minimum scale of rates, or to in some other way effectually stop these insane departures from business principles which seem to be becoming somewhat periodical in their recurrence. The whole business and laboring world are more interested in stability of rates than they are in the question of whether or not those rates are a fraction too high.

Twenty-second. The business of ticket brokerage as carried on in the United States affords a convenient and easy way through which the laws may be violated and discriminations indulged in. It gives to middlemen, for whose existence there is no excuse, a very large amount of money which properly belongs in the coffers of the railways or in the pockets of the people. If the earnings of the railways are reduced through the dealings of the brokers the railways will seek to make it up elsewhere, and the people who know the ropes and who reside in or travel from large cities or centers have a decided advantage over those who are not so fortunately located. If ticket brokerage consisted only of dealing in legitimate tickets, we would not feel that it was so much a matter of proper concern to us. The facts are, however, that in addition to whatever of such dealing they can secure, many ticket brokers resort to schemes and acts which are simply fraudulent and criminal. Forgery, counterfeiting, and misrepresentation as to identity are freely practiced. Ticket brokers' offices are made fences for the reception and sale of transportation which is known to be altered, forged, or counterfeited. Counterfeit receipts for dues paid, and counterfeit cards of membership in our organizations have been sold over the counter of ticket brokers' offices. Conductors in the discharge of their duties are frequently forced into altercations with passengers who, knowingly or unwittingly, have purchased worthless tickets from such offices, and in some instances have been shot down in cold blood by such passenger. Trusted employees have been enticed into wrongdoing which was made possible by the existence of the ticket broker's office and the methods followed therein. Grave suspicion has been cast upon many upright men, and many innocent men have lost their positions on account of transactions which were carried on through, or by, some ticket scalper, and which the employee could not explain because he knew nothing about it.

The natural and legitimate revenues of the railways are seriously invaded or affected by this agency. The interests of the employees are wrapped up in the earning power or capacity of the road, and hence the employees pronounce against the business of ticket brokerage largely for the same reasons given in favor of putting a stop to rate wars.

Twenty-third. Increasing the interest-bearing debt of a railway company or adding to the securities upon which it is sought or intended to pay dividends or returns is simply adding to the burden, already heavy in most instances. The stock of the road may not receive any dividends, but the interest on the bonds must be paid or receiverships, foreclosure sales, and reorganizations follow. Not infrequently, under the protecting wing of the Federal courts, reductions in the wages of the employees are undertaken which would not be undertaken were it not for the protection which the company expects from the court. Unnecessary additions to the fixed charges of a railway should not be permitted.

Twenty-fourth. There is no doubt but that consolidation of railway lines under one management has effected economies in the management and in the traffic and accounting departments. It is not our experience that the large masses of the employees are unfavorably affected by such consolidations. On the contrary, we can cite instances where the employees of a small railway which paid poor wages and afforded very unsatisfactory conditions of employment have been greatly benefited by that line being absorbed by some large system, and the employees thereby brought under the operations of the higher rates of pay and much more advantageous conditions of employment which obtained on the absorbing system.

Q. (By Mr. KENNEDY.) Mr. Sargent has another very important paper. I should like to have it introduced at this point so that it may be printed in the testimony immediately following the paper just read.

Q. (By Mr. PHILLIPS.) Mr. Sargent will state the character of the paper.

Mr. SARGENT. In connection with the paper which has just been submitted by the secretary I wish to say that it is the reply of the five railway organizations. We had a conference in the city of Chicago shortly after receiving your topical plan of inquiry, and we thought best to appoint a committee to prepare answers, and Mr. E. E. Clark, of the Order of Railway Conductors, and myself were selected to prepare the answers and submit them to the commission after they had been referred to Mr. Arthur, Mr. Powell, and Mr. Morrissey, chief officers of the other organizations. We complied with instructions, held another conference, to which this was referred, and it has been approved by all, and the signatures of approval accompany the answers. In addition to that there was referred to me, as a special matter, the first proposition wherein you ask in relation to the

inquiry as to the compulsory performance of service and the mandatory injunction and proceedings for contempt when the railroad is in the hands of a receiver, and the question respecting the liability of railroad companies to their employees for injuries sustained while in the performance of duty. We have had this looked up very carefully, and here you will find some of the many important cases which have come up in the years past, wherein injunction and mandatory proceedings have been brought while railroads were in the hands of a receiver, and also as to the application of the liability of railroad companies to their employees for injuries sustained in the performance of duty, covering every State in the Union. We submit it to you, as we believe it will aid in arriving at such conclusions as you may wish in regard to the matters referred to in your inquiry. This is in addition to the document read by the secretary. It contains the cases, special references thereto, quotes the authorities, and goes into details, and I think you will find it embraces nearly every State in the Union. It is quite a lengthy document, and it will not be necessary to read it. It also has several of the decisions of the United States Supreme Court. (The paper here referred to follows:)

BEFORE THE INDUSTRIAL COMMISSION OF THE UNITED STATES.

TOPICAL PLAN OF INQUIRY.

First. In relation to the inquiry as to compulsory performance of service under mandatory injunction and proceedings for contempt when a railroad is in the hands of a receiver; also as to powers of courts in such cases. (See p. 3 of Topical Plan of Inquiry.)

Second. Respecting the law of liability of railroad companies to their employees for injuries sustained while engaged in the performance of duty. (See p. 4, sections 4 and 5, Topical Plan of Inquiry.)

MODERN GENERAL DOCTRINE.

In England and in the United States it is lawful, and, it may be added, commendable, for any body of men to associate themselves together for the purpose of bettering their condition in any respect, financial or social. The very genius of free institutions invites them to higher levels and better fortunes. They may dictate their own wages, fraternize with other associates, choose their own employers, and serve man and mammon according to the dictates of their own conscience. But while the law accords this liberty to one, it accords a like liberty to every other one, and all are bound to so use and enjoy their own liberties and privileges as not to interfere with those of their neighbors. (Beach on Monopolies and Industrial Trust, pp. 288-289 (1898).)

RECEIVERS AND THEIR EMPLOYEES.

In 1885 the Wabash road was in the hands of a receiver and there was a lock-out in some of the company's shops, and two employees who acted as a committee on behalf of the locked-out and striking employees were punished for contempt by being sent to jail for a term. The syllabi of the case is as follows:

"A writer, signing himself chairman, sent the following notice to the various foremen of the shops of the Wabash company during the strike organized to resist a reduction of wages, the railroad being at that time in the hands of a receiver appointed by the United States circuit court:

"OFFICE OF LOCAL COMMITTEE, January 17, 1885.

"—, Foreman:

"You are requested to stay away from the shop until the present difficulty is settled. Your compliance with this will command the protection of the Wabash employees. But in no case are you to consider this an intimidation."

"Held, that this was an unlawful interference with the management of the road by the receiver, and a contempt of court, for which the writer should be punished." (24 Fed. Rep., 217.)

Where employees of a railroad company that is in the hands of a receiver appointed by the court are dissatisfied with their wages paid by the receiver they may abandon the employment and by persuasion or argument induce other employees to do the same; but if they resort to threats or violence to induce the others to leave, or accomplish their purpose, without actual violence, by over-awing the others by preconcerted demonstration of force, and thus prevent the receiver from operating the road, they are guilty of contempt of court and may be punished for their unlawful acts.

Where a party of men combine with intent to do an unlawful thing, and in the prosecution of that unlawful intent one of the party goes a step beyond the balance of the party and does an act which the balance do not themselves perform, all are responsible for what one does. It is essential, however, that there should be a concert of action—an agreement to do some unlawful thing. (Opinion by Justice Brewer. *United States v. Kane et al.* (1885), 23 Fed. Rep., 748.)

In the following case, after an injunction had been issued against one railroad company and its employees, commanding it to afford the same facilities to a certain other road that it afforded to all other roads, it was held that employees who refused to handle cars of such other road and quit the service of the company rather than handle such cars would not be guilty of contempt of court; but any employee refusing to handle such cars, though not being served personally with an injunction nor a party of the suit, although learning that such an injunction had issued, and his remaining in the service of the company and refusing to handle the cars of the road in question would be guilty of contempt.

Where a labor organization has declared a boycott against a railroad, and connecting roads are therefore refusing or seem about to refuse to afford equal facilities to the boycotted road, in violation of section 3 of the interstate-commerce act, they may be compelled to do so by mandatory injunction, since the case is urgent, the rights of the parties free from reasonable doubt, and the duties sought to be enforced is imposed by law.

A mandatory injunction restraining a railroad company from refusing equal facilities to a connecting line, in violation of section 3 of the interstate-commerce act, is binding upon all officers and employees of the respondent having proper notice thereof whether they are made parties or not.

A court of equity has power to contrive new remedies and issue unprecedented orders to enforce rights secured by Federal legislation provided no illegal burdens are imposed thereby. (*Toledo, A. A. & N. M. Ry. Co. v. Pennsylvania Co. et al.* (March 25, 1893), 54th Fed. Rep., 746.)

Circuit courts of the United States have jurisdiction of a bill in equity to restrain violation of the interstate-commerce law to the irreparable injury of complainant, because of the subject-matter, and without regard to the citizenship of the party.

A combination to induce and procure the officers of a common carrier corporation subject to the provisions of the interstate-commerce act, and its locomotive engineers, to refuse to receive, handle and haul interstate freight from another like common carrier in order to injure the latter, is a combination or conspiracy to commit the misdemeanor described by section 10 of the interstate-commerce act, and, if any person engaged in it does an act in furtherance thereof, all combining for the purpose are guilty of criminal conspiracy, as denounced by section 5440, Revised Statutes.

If the common carrier company against whom such a conspiracy is directed is injured by acts done in furtherance of it, it has a cause of action for its loss against all those engaged in the conspiracy.

The employees, while in the employ of the defendant company, may obey this mandatory injunction, but may, without contempt of court, avoid or evade obedience thereto by ceasing to be such employees; otherwise the injunction would, in effect, be an order compelling the employer to continue the relation of servant to the complainant—a kind of order never yet issued by a court of equity.

A preliminary injunction may issue against the chief member of such a conspiracy as that above described to restrain him from giving the order and signal which will result and is intended to result in the unlawful and irreparable injuries to the complainant. Where such chief member has already issued such an unlawful, wilful, and criminal order, the injurious effect of which will be continuing, the court may by mandatory injunction compel him to rescind the same, especially when the necessary effect of the order or signal is to induce and procure flagrant violations of an injunction previously issued by this court. (*Toledo, A. A. & N. M. Railway Co. v. Pennsylvania Co. et al.* (April 3, 1893), 54th Fed. Rep., 730.)

It would be an invasion of one's natural liberty to compel him to work for, or to remain in the personal service of, another. One who is placed under such restraint is in a condition of involuntary servitude, a condition which the supreme law of the land declares shall not exist within the United States, or in any place subject to their jurisdiction.

The fact that employees of railroads may quit under circumstances that would show bad faith on their part, or a reckless disregard of their contract, or of the convenience and interests of both employer and the public, does not justify a departure from the general rule that equity will not compel the actual, affirma-

tive performance of merely personal services, or (which is the same thing) require employees, against their will, to remain in the personal service of their employer.

These employees having taken service first with the company, and afterwards with the receivers, under a general contract of employment which did not limit the exercise of the right to quit the service, their peaceable cooperation, as the result of friendly argument, persuasion, or conference among themselves, in asserting the right of each and all to refuse further service under a schedule of reduced wages, would not have been illegal or criminal, although they may have so acted in the firm belief and expectation that a simultaneous quitting without notice would temporarily inconvenience the receivers and the public. If in good faith, and peaceably, they exercise their right of quitting the service, intending thereby only to better their condition by securing such wages as they deem just, but not to injure or interfere with the free action of others, they can not be legally charged with any loss to the trust property resulting from their cessation of work in consequence of the refusal of the receivers to accede to the terms upon which they were willing to remain in the service. Such a loss, under the circumstances stated, would be incidental to the situation, and could not be attributed to employees exercising their lawful rights in orderly ways, or to the receivers when, in good faith and in fidelity to their trust, they declare a reduction of wages, and thereby cause dissatisfaction among employees, and their withdrawal from service.

According to the principles of the common law, a conspiracy upon the part of two or more persons, with the intent, by their own combined power, to wrong others or to prejudice the rights of the public, is in itself illegal, although nothing be actually done in execution of such conspiracy. This is fundamental in our jurisprudence. So, a combination or conspiracy to procure an employee or body of employees to quit service in violation of the contract of service would be unlawful, and in a proper case might be enjoined if the injury threatened would be irremediable at law.

It seems entirely clear, upon authority, that any combination or conspiracy upon the part of these employees would be illegal which has for its object to cripple the property in the hands of the receiver, and to embarrass the operation of the railroads under their management, either by disabling or rendering unfit for use engines, cars, or other property in their hands, or by interfering with their possession, or by actually obstructing their control and management of the property, or by using force, intimidation, threats, or other wrongful methods against the receivers or their agents, or against employees remaining in their service, or by using like methods to cause employees to quit, or prevent or deter others from entering the service in place of those leaving it.

(In the opinion circumstances are described under which courts of equity will interfere by injunction to prevent strikes, or what is termed illegal interference with property.) (*Arthur et al. v. Oakes et al.* (Oct. 1, 1894), 63d Fed. Rep., 310.)

In *re Debs et al.* was a habeas corpus proceedings to procure the discharge of the defendant who had been committed to jail for contempt of court.

The defendants were charged with ordering members of their organization and others to refuse handling Pullman cars, as there was a strike and lockout at the Pullman works. They were enjoined from in any way interfering with the employees working on roads engaged in interstate commerce, some of which roads were in the hands of receivers, and particularly on account of these roads having contracts with the United States to carry its mail.

In the opinion it was held that the United States had the right to remove obstructions on both natural and artificial highways over which it was necessary for it to carry its mails, and also that owing to great public inconvenience and injury it had a right to supervise interstate commerce, and that after an injunction was issued to prevent the defendants from interfering with the operation of roads in the hands of the receiver, or other roads engaged in interstate commerce and the carrying of United States mail, if violated, the defendants might be punished for contempt. In all such cases the Federal courts had power to enjoin all persons from any interference with the discharge of the duties before mentioned; and whether or not any person was actually served with such injunction if he had notice of it in any manner, it was binding upon him. (The above fairly states the substance of the opinion.) (*In re Debs et al.* (May 27, 1895), 158 U. S., 564.)

In an order issued by Judge Jenkins in 1894 the court went so far as to enjoin employees from quitting or leaving the service of the receivers, either collectively or individually. A part of the order is as follows:

And from combining and conspiring to quit, with or without notice, the service of said receivers, with the object and intent of crippling the property in their

custody or embarrassing the operation of the said railroad, and from so quitting the service of the said receivers, with or without notice, as to cripple the property, or to prevent or hinder the operation of said railroad. (*Farmers' Loan and Trust Co. v. Northern Pac. Ry. Co. et al.*, 60th Fed. Rep., p. 803.)

The receivers of the Union Pacific Railway in 1894 filed a petition in Judge Dundy's court at Omaha to annul the existing schedule of wages between employees and the company, and in lieu thereof prayed to put into force others which the receivers filed in court. The new schedules made many changes in the existing rules and reduced the wages of certain classes of employees. Also the receivers prayed for an injunction enjoining the employees from striking or interfering with the receivers in the management of the road, when their schedule should go into force. The court granted the injunction, which forbid the employees from striking or quitting the service of the company, the order of the court being more sweeping, if anything, than that of Judge Jenkins, which has been hereinbefore given. However, it might be stated that before Judge Dundy's order became effectual, steps were taken to bring the matter before a court that had more extended jurisdiction, and the whole matter was brought before Judge Caldwell, circuit judge, and Ryner, district judge, who ordered a full and complete investigation of the matters in dispute between the employees and receivers; and after such hearing Judge Caldwell rendered an opinion, in which Judge Ryner concurred, sustaining the position taken by the employees. (See *Ames et al. v. Union Pac. Ry. Co. et al.* (April 5, 1894), 62d Fed. Rep., 7.)

NOTE.—The injunction referred to issued by Judge Dundy seemingly has not been reported.

Where employees of a railroad company, though in remaining in its employment, refused to perform their duties of operating its trains so long as Pullman cars are hauled, though the company is bound by contract to carry them, thus interrupting interstate commerce and the transmission of the mails, and subjecting the company to suits and great irreparable damages, injunction will issue requiring them to perform their duties during the continuance in the company's employment. (*Southern Cal. Railway Co. v. Rutherford et al.* (June 3, 1894), 62d Fed. Rep., 796.)

PART SECOND.

Respecting the law of liability of railroad companies to their employees for injuries sustained while engaged in the performance of duty, and also persons who may recover damages.

General rule.—An employer is liable in damages to his employee where the employee, free from negligence, sustains an injury through the employer's negligence. Such negligence may consist in the doing of something by the employer which, in the exercise of ordinary care and prudence, he ought not to have done, or in the omission of any duty or precaution which a prudent, careful man would or ought to have taken.

It is the duty of the master to furnish his servant with such appliances, tools, and machinery as are suited to his employment and may be used with safety; and if the master fails to use ordinary care in the selection or inspection and care after such selection of the appliances his neglect, ignorance, or defects therein will not excuse him from liability for an injury caused thereby. He is responsible for all defects in machinery or appliances for which he should or could have known, but failed through negligence to learn of, or which, having learned of, he failed to remedy.

A railroad company is liable for injuries to its employees occasioned by the company's negligence in failing to keep its track or roadbed or other surroundings under its control in proper condition; however, its duty in this respect is only that it is required to use reasonable care in keeping them in safe condition.

Employers are not required to furnish the best and latest improved machinery, but only such as is reasonably safe and suitable.

A master who sets a servant to work in a place of danger without giving him such warning and instructions as the youthfulness, inexperience, or lack of capacity on the part of the servant reasonably requires, is guilty of negligence and liable to the servant for an injury arising therefrom.

It is the duty of the employers to make and promulgate such rules and regulations for the government of their employees as will, if observed, give them reasonable protection; and employees are bound to obey all lawful and reasonable commands of their employers, and an injury resulting to the employee while disobeying rules would not entitle him to recover damages.

ASSUMPTION OF RISK BY EMPLOYEES.

General doctrine.—Where an employment is accompanied with risk, of which those who enter it have, or are presumed to have, notice, they can not, if they are injured by exposure to such risks, recover compensation for injuries from their employer. By contract to perform hazardous duties the employee assumes such risks as are incident to their discharge, and he assumes not only the risk existing at the beginning of his employment, but also such as arises during its course, if he had, or was bound to have, knowledge thereof. He does not, however, assume the risk of danger arising from the unsafe or defective methods, machinery, or other instrumentalities unless he has, or may be presumed to have, knowledge or notice thereof; and the burden of proof that an injured employee had such knowledge or notice of the defect or obstruction causing the injury is upon the employer.

The employee also assumes all risk of latent defects in appliances or machinery, unless the master was negligent in not discovering such defects.

Fellow-servants.—The general rule at common law is that he who engages in the employment of another for the performance of specified duties and services for compensation, takes upon himself the natural and ordinary risks and perils incident to the performance of such services. The perils arising from the carelessness and negligence of those who are in the same employment are no exception to this rule, and where a master uses due diligence in the selection of competent, trusty servants, and furnishes them with suitable means to perform the services in which they are employed, the master is not answerable to one of them for an injury received in consequence of the carelessness and negligence of another while both are engaged in the same service.

All persons are fellow-servants where they are engaged in the same common pursuit under the same general control.

All who serve the same master work under the same control, derive authority and receive compensation from the same common source, and are engaged in the same general business, though it may be in different grades or departments of it, are fellow-servants, who take the risk of each other's negligence.

(The above is the general doctrine as to liability of employers to their employees and of the assumption of risk by the employee. However, there are many distinctions and modifications of the doctrine stated, so that each particular case is largely governed by the facts. As for instance, where an employee knew of a danger and his master promised to remedy it on condition that the employee continue work, if, in the meantime, such employee was injured, he could recover, not having assumed the risk. It would take too much space to point out these distinctions here, and perhaps would in no way be profitable, under the circumstances, to pursue their investigation.)

Who can sue for injury.—All of the States and Territories within the United States have a statute giving the right to the person injured to bring an action for damages, and in the event the injury is fatal, then the statute provides either that the widow or heirs of the decedent may bring an action for the recovery of pecuniary damages, or if the widow or heirs be not given such right, the personal representatives of the decedent, which would be his executors or administrators, are given the right to sue, and as the personal representatives sue for the benefit of the estate, and as the widow and heirs participate in the proceeds of the estate, then they are permitted to derive benefit from any recovery that might be had, much the same as if they themselves were entitled to sue.

State rules respecting liability of the employers for injuries and assumption of risk of employees, and doctrine of fellow-servant.

ALABAMA.

Where two persons are employed in the same general business by a common employer, if one is injured by the negligence of the other the employer is not responsible. (*Mobile and Ohio R. Co. v. Thomas*, 42 Ala., 672.)

All employees are fellow-servants when they come within general rules, stated hereinbefore. They assume the ordinary known risks incident to the employment, and also injuries by carelessness or negligence of fellow-servants.

ARIZONA.

In this State apparently there is no legislation on the subject of employers' liability.

It was held that a section foreman, injured through the misconduct of a conductor of a train upon which the former was riding, in hurriedly directing him and his men to get on the train, so as to get the train out of the reach of an approaching one, was the fellow-servant of such conductor. The reason given was that the section foreman had no duties to perform on the train, and was not, as to his duties, subject to the control or directions of the conductor, and therefore was entitled to recover. (*McGill v. Southern Pac. R. Co.*, 33 Pac., 821.)

However, in another case, where a conductor and foreman of a section crew were engaged in clearing the track of a wreck on a section of the road under the latter's charge, they being under control of a superior, and the foreman was injured while riding on a train in charge of such conductor from the place of work, it was held that they were fellow-servants. (*Southern Pac. Co. v. McGill*, 44 Pac., 302.)

ARKANSAS.

It was held where work was such as required a skillful or careful supervision, and where such supervision is necessary to the safety of the laborers engaged upon the work, it is the master's duty to bestow and, if he appoints an agent to perform that duty, he is responsible for his negligence. (*Bloyd v. St. Louis and S. F. R. Co.*, 22 S. W., 1089.)

A train dispatcher who controls the movement of trains represents the company and is not a fellow-servant of an engineer injured in a collision resulting from his negligence. (*Little Rock and M. R. Co. v. Barry*, 23 S. W., 1097.)

Also, one who has the power to employ and discharge laborers is the vice-principal, as regards the duties to warn such laborers of special risks in their employment. (*Fort Smith Oil Co. v. Slover*, 24 S. W., 106.)

(In this State it has been held that a brakeman and car repairer, a yard master and car inspector, a foreman of a gang of bridge carpenters, and one of the workmen, were fellow-servants. General doctrine as to assumption of risks prevails.)

CALIFORNIA.

Whether the negligent act of a section foreman of a railroad company, by which an accident is caused to a section hand, is a personal duty which the company owes to the section hand as its employee, or whether the accident is in consequence of the negligence of another person employed by the same employer, within the meaning of section 1970 of the civil code, must be determined, not from the grade or rank of section foremen, but from the character of the act causing the injury.

If the act is one which it is the duty of the company to perform toward the section hand, the section foreman, in performance of such duty, acts as the agent of such company, for which the employer is responsible; but if it is not one of the duties of the company (like in common work that any workman would be expected to do), the foreman and section hand are fellow-servants, and the foreman is alone responsible for an accident to a section hand resulting therefrom.

The law recognizes no distinction growing out of the grades of employment of the respective employees. * * * The duties which a railroad corporation owes its servants, and which it is required to perform, are to furnish suitable machinery and appliances by which the service is to be performed, and to keep them in repair and order; to exercise ordinary care in the selection and retention of sufficient, competent servants to properly conduct the business in which the servants are employed, and to make such provisions for the safety of employees as will reasonably protect them against the dangers incident to their employment.

The performance of this duty can not be shifted by it to a servant so as to avoid responsibility for injuries caused to another servant by its omission; but where a section foreman left a switch open and a section hand was injured, it was held that a foreman and section hand were fellow-servants. (*Davis v. Southern Pac. R. Co.*, 98 Cal., 19.)

In this State an employee was allowed to recover damages on account of proper machinery not having been selected; also on account of the improper construction of a roadbed; also where a boy was injured on account of a defective platform while he was endeavoring to adjust a belt.

It has been held that a train dispatcher and a material man on a road, were not fellow-servants; also where a foreman of a gang of men to whom the stevedore delegated the entire management of the work of unloading a vessel with full discretion to control and supervise it was not a fellow-servant with his subordinates; and also it was held that a hod carrier injured by the unsafe manner in which a

scaffold was constructed was not a fellow-servant with the carpenter. However, a brakeman and conductor on a railroad train are held to be fellow-servants, and the foreman of a mine and the miner employed to work under his directions are fellow-servants. An engineer and conductor upon a railroad train are likewise held to be fellow-servants. Likewise a foreman and engineer of a ferryboat are held to be fellow-servants. Nor is the employer liable for any injury to one fellow-servant by another while engaged in the master's work.

COLORADO.

After referring to the rules established in several of the States, it is said: The better rule, as we extract from the best-reasoned cases, is that for the acts of the vice-principal done in the scope of his employment, and such as properly devolve upon the master in his general duty to his servant, the master is liable; while for all such acts as relate to the common employment and are on a level with the acts of fellow-laborers, except such acts done by the vice-principal against the reasonable objection of the injured servant, the master is responsible. In other words, the test of liability is the character of the act rather than the relative rank of the servant. (*Deep Mining Drainage Co. v. Fitzgerald*, 43 Pac., 210.)

In this State where a superior employee gave direction to stop a car, and the appliance used to accomplish such stoppage was defective, it was held that the superintending employee was a vice-principal and the injured one could recover. Likewise, a foreman having authority to hire and discharge is not a fellow-servant of other employees.

A person employed by a mine owner to timber a drift, so as to provide a safe place for the miners running their shaft in which to work, is not a fellow-servant of the miners.

A teamster engaged in hauling coal for a tramway company is a fellow-servant with an employee in charge of one of its boilers.

CONNECTICUT.

The rule which exempts the master from liability for negligence of the fellow-servant applies not only in cases in which the servant injured is engaged in the same grade of employment as the servant whose negligence occasioned the injury, but also in cases in which the two servants are engaged in different grades of employment, if the services of each are directed to the same general end. It also applies to cases where the injured servant is of a grade of the services inferior to that of the servant whose negligence occasioned the injury, though the inferior in grade is subject to the orders of the superior; and it is not essential, in order to exempt the master from liability, that the injured servant at the time of receiving the injury should be engaged in the same particular work as the servant by whose negligence the injury was occasioned. If both servants are in the employment of the same master, work under the same control and in the same general business, and derive authority and compensation from the same common source, the master is not liable, but this rule has no application where the servant sustains an injury through a master's negligence alone, or through the negligence of the master combined with the negligence of a fellow-servant. In respect to appliances furnished for the use of his employees, the master's duty is that of reasonable care to provide such as are suitable. (*Wilson v. Willimantic Linen Co.*, 50 Conn., 433.)

Also held that a train dispatcher was not a fellow-servant with the engineer, the engineer being bound to obey the orders of the dispatcher.

DELAWARE.

Those who perform duties personal to the master are, in respect to such duties, vice-principals. A general manager or overseer or superintendent of machinery represents the master. (*Foster v. Pussey*, 8 Houston, 168; 14 Atl., 545.)
(In this State the general common-law doctrine seems to prevail.)

FLORIDA.

A fellow-servant is one engaged with another under a common master and in the same common employment, so that they are brought into contact with each other, notwithstanding they are subject to the orders and under the exclusive control of separate bosses and foremen and at different work in the same service.

For illustration: If one was engaged as a common laborer to work on the roadbed of a gravel train, he would not be a fellow-servant with the engineer or conductor on a passenger train, but would be a fellow-servant with all employed on the roadbed or gravel train, if his employment was in a common work and brought him in immediate contact with them and risk through them, although working under orders of a different boss or foreman in said common work. It was held that one of the shovelers upon a gravel train and the engineer were fellow-servants in respect to the act of the engineer in putting the handling of his engine into the hands of his fireman, who was either careless or unskilled in the management of such machines, (*Parrish v. Pensacola and A. R. Co.*, 28 Fla., 551; 9 So. Rep., 696.)

This State at present has the following enactment: If the person injured is himself an employee of the company, and the damage was caused by another employee of the company and without fault on the part of the person injured, his employment by the company shall be no bar to recover, and no contract which restricts such liability shall be legal or binding. It was held that this act having been borrowed from Georgia and having received a construction there in effect that the right of the employee to recover depends upon his being entirely free from fault or negligence, such construction became a part of the law of Florida. (*Duval v. Hunt et al.*, 34 Fla., 85; 15 So. Rep., 876.)

(The doctrine is laid down also in this State that where the master delegates to the servant any duty which is personal to himself, as, for instance, the providing of suitable machinery or inspecting a roadbed, or the like, the act of the servant is held to be that of the master, and it is immaterial whether the servant occupies a high or low position.)

GEORGIA.

This State abolished the common-law rule by statute as far as it extends to master and servants on railroads. Section 2083 of the code of 1882 provides that railroad companies are common carriers, and liable as such. As such companies have many employees who can not possibly control those who should exercise care and diligence in the running of trains, such company should be liable to such employees as to passengers for injuries received from the want of such care and diligence. Section 3036 of the code provides substantially as hereinbefore given as the Florida law.

However, in this State it was held that the statute did not apply where a receiver was in charge of the road, and that the common-law doctrine prevailed. (*Henderson v. Walker et al.*, 55 Ga., 481.)

Under the statute any supposed fault of the employee, however slight, which contributed to the injury for which he sues, would defeat his action. (*Kennedy v. Central R. Co.*, 61 Ga., 590.)

IDAH0.

The general common-law doctrine seems to prevail. In this State where a miner while ascending a ladder in the mine was injured by being struck with a drill which was being lowered down the shaft by a blacksmith, it was held that he could not recover; that each employee was the fellow-servant of the other. (*Snyder v. Viola Mining and S. Co.*, 26 Pac., 127.)

ILLINOIS.

Where an employee is hurt in an employment wholly separate and disconnected from that of the servant who caused the injury, a recovery may be had, where there is negligence, the same as in other cases. A clerk in a depot, a carpenter employed constructing and repairing cars in a shop, or other persons disconnected with the management of trains and its officers, may recover where, by the carelessness of those running trains, he is injured. The rule only applies that a fellow-servant can not recover for the injury occasioned by the fellow-servant where they are engaged in the same department of business. The object of this rule is to make each servant vigilant in seeing that the others are careful, prudent, and faithful in the discharge of their duties; and if not, that it shall be to their interest to report all derelictions that occur. (*Pittsburg, F. W. and C. R. Co. v. Powers*, 74 Ill., 341.)

Persons may be fellow-servants, although not strictly in the same line of employment. One person may be employed to transact one department of business, and another may be employed by the same master to transact a different and distinct branch of business, but if their usual duties bring them into habitual asso-

ciation, so that they may exercise a mutual influence upon each other promotive of proper caution, such persons might be regarded as fellow-servants. (*Rolling Mill Co. v. Johnson*, 113 Ill., 64; *Joliet Steel Co. v. Shields*, 146 Ill., 603.)

In this State it has been held that any duty personal to the master, though delegated to a servant, the master would be held liable for the acts of the servant; as where a laborer in a lumber yard was injured by following the direction of the superintending employee in the yard, he was permitted to recover. Also it has been held that an assistant superintendent is the representative of the company and not a fellow-servant of a conductor. Also where an employee was injured by an iron girder, the defective condition of which was known to the foreman, he was held not to be a fellow-servant of the injured employee. Also a pit boss in a mine and a superintendent of a mine were held not to be fellow-servants with injured employees. But according to the rule stated brakemen on train are fellow-servants, and where a head blacksmith who, while proceeding with a number of other employees upon a train to remove a wreck, was injured by the negligence of the engineer, who also acted as conductor, it was held that all such employees were fellow-servants. (*Abend v. T. H. and I. R. Co.*, 111 Ill., 202.)

An engineer upon a switch engine and a switchman working with him are held fellow-servants. Where a conductor was killed by a collision of two trains, and the collision was brought about by the negligence of employees on the other train, all were held to be fellow-servants, and no recovery could be had. Also an engineer operating an engine letting down a cage to the bottom of the shaft and a track layer at the bottom were held fellow-servants. (*Niantic Coal and Mining Co. v. Leonard*, 126 Ill., 216.)

Also, locomotive engineers of the same road are fellow-servants. Switchmen belonging to different switching crews are fellow-servants. Likewise a hostler and his helper were held to be fellow-servants, though a track employee and locomotive engineer were held not fellow-servants. And where an engineer was killed by the explosion of a boiler he was held not a fellow-servant with those whose duty it was to furnish a safe boiler. Also a railroad laborer, whose duty it was to unload rails from cars, was held not a fellow-servant with the engineer.

(The rule seems settled that the employees, although working for the same master, if they are engaged in different departments of work, where their association is such that they can not influence the acts of employees engaged in different grades of service, then they are to be considered as not being fellow-servants. But, on the other hand, if servants in two different grades mingle together in the performance of their respective duties, so that the action of each may have some bearing toward influencing the acts of others, then in such case they are fellow-servants.)

INDIANA.

SEC. 1. *Be it enacted by the General Assembly of the State of Indiana, That every railroad or other corporation, except municipal, operating in this State, shall be liable for damages for personal injuries suffered by any employee while in its service, the employee so injured being in the exercise of due care and diligence, in the following cases:*

First. Where such injury is suffered by reason of any defect in the condition of ways, works, plant, tools, and machinery connected with or in use in the business of such corporation, when such defect was the result of negligence on the part of the corporation, or some person intrusted by it with the duty of keeping such way, works, place, or machinery in proper condition.

Second. Where such injury resulted from the negligence of any person in the service of such corporation to whose order or direction the injured employee at the time of his injury was bound to conform and did conform.

Third. Where such injury resulted from the act or omission of any person done or made in obedience to any rule, regulation, or by-law of such corporation, or in obedience to the particular instructions given by any person delegated with the authority of the corporation in that behalf.

Fourth. Where such injury was caused by the negligence of any person in the service of such corporation who has charge of any signal, telegraph office, switch yard, shops, roundhouse, locomotive engine, or train upon a railway, or where such injury was caused by the negligence of any person, coemployee, or fellow-servant engaged in the same common service in any of the several departments of the service of any such corporation, the said person, coemployee, or fellow-servant at the time acting in the place and performing the duty of the corporation in that behalf, and the person so injured obeying or conforming to the order of some

superior at the time of such injury having authority to direct; but nothing herein contained shall be construed to abridge the liability of the corporation under existing laws.

SEC. 2. Neither an employee, nor his legal representative, shall be entitled under this act to any right of compensation or remedy against the corporation in any case where the injury results from obedience to an order which subjects the employee to palpable danger, nor where the injury was caused by the incompetency of the coemployee, and such incompetency was known to the employee injured, or such injured employee, in the exercise of reasonable care, might have discovered such incompetency, unless the employee so injured gave, or caused to be given, information thereof to the corporation or some superior intrusted with the general superintendence of such coemployee, and such corporation failed or refused to discharge such incompetent employee within a reasonable time, to investigate the alleged incompetency of the coemployee or superior, and discharge him if found incompetent.

SEC. 3. The damages recoverable under this act shall be commensurate with the injury sustained unless death results from such injury, when in such case the action shall survive, and be governed in all respects by the law now in force in respect to such actions: *Provided*, That where any such person recovers a judgment against a railroad or other corporation, and such corporation takes an appeal, and pending such appeal the injured person dies, and the judgment in the court below is thereafter reversed, the right of action of such person shall survive to his legal representatives.

SEC. 4. In case any railroad corporation which owns or operates a line extending into or through the State of Indiana and into or through another or other States, and a person in the employ of such corporation, a citizen of this State, shall be injured as provided in this act, in any other State where such railroad is owned or operated, and a suit for such injury shall be brought in any of the courts of this State, it shall not be competent for such corporation to plead or prove the decisions or statutes of the State where such person shall have been injured as a defense to the action brought in this State.

SEC. 5. All contracts made by a railroad or other corporation with their employees, or rules or regulations adopted by any corporation, releasing it or relieving it from liability to any employee having a right of action under the provisions of this act, are hereby declared null and void. The provisions of this act, however, shall not apply to any injuries sustained before it takes effect, nor shall it affect in any manner any suit or legal proceedings pending at the time it takes effect.

IOWA.

The code, section 1307 provides:

"Every corporation operating a railway shall be liable for all damages sustained by any person, including employees of such corporation, in consequence of the neglect of agents or by the mismanagement by engineers or other employees of the corporation, and in consequence of the willful wrongs, whether of commission or omission, of such agents, engineers, or other employees, when such wrongs are in any manner connected with the use and operation of any railroad on or about which they shall be employed, and no contract which restricts such liability shall be legal or binding."

Under the law a receiver was held liable the same as if the corporation were managing the road. However, one must be doing something tending toward the operation and management of the road to be within the benefit of the provision of the act, for it was held that a laborer in a machine shop of a railway company who was injured by a locomotive driving wheel which the plaintiff and other employees were moving was not within the benefits of the act, and that he was in no manner connected with the management of the railroad. (*Potter v. C. R. I. and P. R. Co.*, 46, Iowa, 400.)

Also a sweeper in the roundhouse was not within the act, nor was an injured wiper within the act. Likewise a coal shoveler, a member of a construction gang, one engaged in elevating coal to the tender of engines, were all held not to come within the meaning of the act.

KANSAS.

The Iowa statute just given was adopted by the State of Kansas. The courts of Kansas have more liberally construed the law in favor of the employees than has the Iowa courts, and the statute was held to apply where one employee was injured by the negligence of another while both were engaged in the roundhouse in putting an engine in condition for immediate use. (*C. R. I. and P. R. Co. v. Stahley*, 62 Fed., 363).

KENTUCKY.

The rule that where one or two fellow servants is injured by the negligence of the other, the common laborer is not liable therefor, does not apply in a case of willful neglect if the two servants are not coequals. An engineer and a brakeman on the same train are not coequals, and the company is liable for the death of the latter caused by the willful neglect of the former. (*Louisville and N. R. Co. v. Brooks*, 83 Ky., 129.)

Though when one coequal injures another the injured employee can not recover. (*Louisville, C. and L. R. Co. v. Cavens*, 9 Bush., 559.)

Employees of one train with reference to those controlling another are regarded as agents of the company, and are not fellow servants. (*Louisville, C. and L. R. Co. v. Cavens*, 9 Bush., 559.)

Where a car repairer went under a car to repair it at the direction of the conductor the company was held liable, and where an engineer of a train was injured in a collision with a freight train, on account of the neglect of the train dispatcher, it was held that the company was liable. Also that a railroad yard switchman and a locomotive engineer were not fellow-servants. (*Louisville and N. R. Co. v. Sheets*, 13 S. W., 248.)

LOUISIANA.

In this State, while the Roman law instead of the common law was adopted and prevails, yet from all of the decisions it would appear that the common-law doctrine and the decisions of other States under it are followed in this State with respect to the liability of railroad companies to their employees. And the doctrine of fellow-servants which exists in the common-law States seems to be adopted by this State.

MAINE.

The common-law doctrine seems to be in full force and closely adhered to respecting the liability of masters to their servants, and also the doctrine of fellow-servants as explained under the decisions of the various common-law States is given full effect in this State.

MARYLAND.

The common-law doctrine seems to be in full force in this State respecting the relation of employer and employee, and it was held that a train dispatcher, employed by the division superintendent, though he has power to employ and discharge brakemen and firemen and has general charge of the movements of trains, is a fellow-servant of an engineer, who is also subject to the directions of the division superintendent. (*Norfolk and W. R. Co. v. Hoover*, 79 Md., 253; 29 Atl., 994.)

MASSACHUSETTS.

The common-law doctrine governs the relation of employer and employee in this State.

MICHIGAN.

In this State the general common-law doctrine prevails, but courts have construed the doctrine of fellow-servant very liberally in favor of the employee, more so than some of the other States, and it has been held where the train dispatcher of the railroad company who has absolute control over the moving of its train, and is charged with the duty of directing its movements, is not a fellow-servant of the employees in charge of the trains, who are bound to obey his directions. (*Hunn v. Michigan Cent. R. Co.*, 78 Mich., 513; 44 N. W., 502.)

Likewise, section men and operatives of trains are not fellow-servants. An assistant roadmaster was held not a fellow-servant with an employee on a train. A fireman and engineer, however, were held to be fellow-servants. (*Henry v. Lake Shore M. S. R. Co.*, 49 Mich., 495.)

An engineer of one train and a conductor of another were held fellow-servants. Also a conductor directing the unloading of a freight car is a fellow-servant of the brakeman doing the work.

MINNESOTA.

Chapter 13, laws of 1887, provides that every railroad company owning or operating a railroad in this State shall be liable for all damages sustained by any agent or servant thereof by reason of the negligence of any other agent or servant thereof, without contributory negligence on his part, when sustained in this State, and no contract, rule, or regulation between such corporation and any agent or servant shall impair or diminish such liability, provided, that nothing in this act shall be so construed to render any railroad company liable for damage sustained by any employee, agent, or servant while engaged in the construction of any road or any part thereof not open to public travel or use. This statute, like the Iowa statute, applies only to those actually engaged in the moving of trains. With reference to other employees and their employer the common law doctrine prevails.

MISSISSIPPI.

Every employee of a railroad corporation shall have the same right and remedies for an injury suffered by him from the act or omission of the corporation or its employees as are allowed by law to other persons not employees, where the injury results from the negligence of a superior, agent, or officer, or of a person having the right to control or direct the service of the party injured, and also when the injury results from the negligence of a fellow-servant engaged in another department of labor from that of the party injured, or of a fellow-servant on another train of cars, or one engaged about a different piece of work.

The constitution of 1890, section 192, provides that every employee of a railroad corporation shall have the same rights and remedies for any injury suffered by him from the acts or omission of said corporation, or its employees, as are allowed by law to other persons not employees where the injury results from the negligence of a superior, agent, officer, or of a person having the right to control or direct the service of the party injured. Under these laws it was held that a fireman of an engine and a telegraph operator were engaged in different departments or by different pieces of work, within the meaning of the law. (*Ill. Cent. R. Co. v. Hunter et al.*, 12 So., 482.)

MISSOURI.

In this State the common law doctrine governing the relation of employer and employee prevails. With respect to employees in different grades of employment the courts have construed the law somewhat favorably toward the employee; as, where a switchman was under the orders of a yard master, it was held that he was not a fellow-servant of the latter. (*Taylor v. Mo. Pac. Ry. Co.*, 16 S. W., 206.)

A railroad track layer and locomotive engineer were held not fellow-servants; nor a train dispatcher with the employees moving the train.

MONTANA.

Section 697, statute of 1888, provides that in every case the liability of the corporation to the servant or employee acting under the orders of his superior shall be the same in case of injury sustained by the default or wrongful acts of his superior, or to an employee not appointed or controlled by him, as if such servant or employee were a passenger.

Under such section it was held that a conductor was a vice-principal as to a fireman, and that a conductor and engineer of a train are the superior of brakemen on the same train within the meaning of the statute. (*Crysswell v. Mont. Cent. R. Co.*, 42 Pac., 767.)

NEBRASKA.

The general common-law doctrine seems to prevail in this State, but the courts seemingly have construed the law most favorably to the employee, and wherever any person was acting in an authoritative position over the employee the courts have held him to be a vice-principal, as a conductor of a gravel train on a railroad with a gang of men under his control was held to be, as to such men, a vice-principal, and also a vice-principal as to the subboss under his control. (*Burlington and M. R. R. Co. v. Crockett*, 26 N. W., 921.)

NEW HAMPSHIRE.

In New Hampshire the common-law doctrine appears to prevail respecting the relation of master and servant, and also with respect to the doctrine of fellow-servant, although apparently the decisions of the court in deciding a question as to who are fellow-servants do not draw the lines very strictly against the injured employee.

NEW JERSEY.

The common-law doctrine prevails in this State. However, it has been said: "It is a matter of judicial disagreement whether the master can discharge the duty of examining and ascertaining whether appliances have become unfit or unsafe from wear and tear or otherwise, and the similar duty of keeping tools and appliances in repair, by selecting and employing competent persons to make inspections and repairs. In our courts it is held that the master's duty may be thus discharged." (*Essex Electric Co. v. Kelley*, 29 Atl., 427.)

In this State the law is construed very strongly against the injured servant.

NEW MEXICO.

Section 2308-2310 (1885), Compiled Laws, provides in substance that where any person comes to his or her death by reason of the negligence or carelessness or criminal action of an agent, officer, or employee of a railroad company his or her representative may recover of the company \$5,000. But the courts have construed this section as giving only a right of action to the personal representatives or heirs of the decedent, and have held that it does not in any way do away with the common doctrine as between the master and servant.

NEW YORK.

In this State the common-law doctrine prevails. And it was held that an engineer of a gravel train and a laborer were fellow-servants. (*Russel v. Hudson R. R. Co.*, 17 N. Y., 134.)

Though it was held that the failure of a conductor of a freight train to employ or secure a brakeman in a case where one employee failed to appear, and in starting the train with insufficient force, as a result of which negligence a brakeman was killed, was held not the neglect of the fellow-servant, the court holding that the conductor represented the company in the duty which he was performing or failed to perform. (*Flike v. Boston and Albany Ry.*, 53 N. Y., 549.)

In general the scope of decisions are most unfavorable to the injured employee.

NORTH CAROLINA.

The general common-law doctrine prevails in this State.

NORTH DAKOTA.

The general common-law doctrine prevails in this State.

OHIO.

Ohio, in 1890, enacted a law which, without setting it out verbatim, the title will give a correct idea of its scope: "For the protection and relief of railroad employees; forbidding certain rules, regulations, contracts and agreements, and declaring them unlawful; declaring it unlawful to use cars or locomotives which are defective, or defective machinery or attachments thereto belonging, and declaring such corporation liable in certain cases for injury received by its servants and employees on account of carelessness or negligence of fellow-servants or employees."

Under the law, it was held that an engineer in charge of a locomotive, who has authority to direct and control a fireman on such locomotive, is a superior within the meaning of the statute. (*Railroad Co. v. Margrat*, 51 Ohio St., 130.)

The law makes the company responsible for any injury to a servant that results from any other employee who has the control, direction, or superintendence of or over the injured employee.

OREGON.

The general common-law doctrine prevails in this State.

PENNSYLVANIA.

The general common-law doctrine prevails in this State. But it has been held that a boiler maker in the machine shop of a railroad company is not such a coemployee of an engineer on a locomotive as will relieve the company from his negligence in repairing a boiler. (*Penn. and N. Y. C. and R. Co. v. Mason*, 100 Pa. St., 239.)

Also a train dispatcher who has power to move trains and make new schedules is not a coemployee with the train men. (*Lewis et al. v. Seifert*, 116 Pa. St., 628.)

RHODE ISLAND.

The general common-law doctrine seems to prevail in this State.

SOUTH CAROLINA.

The general common-law doctrine appears to prevail in this State. The decisions are not altogether in harmony, some construing the law most in favor of the master and others seemingly in favor of the employee; as, for instance, where it was the duty of a certain employee to keep machines in repair, and a shuttle was thrown from a machine which was defectively repaired and injured another employee, it was held that the injured employee could not recover. (*Gunter v. Graniteville Mfg. Co.*, 15 S. C., 443.)

However, a locomotive engineer and track laborer were held not fellow-servants. (*Calvo v. Charlotte C. and A. R. Co.*, 23 S. C., 526.)

Also a conductor of a train was held to be the representative of the company and not a fellow-servant with other employees operating the same train under his orders. (*Boatwright v. North Eastern R. Co.*, 25 S. C., 128.)

Though it was held where a fireman was injured on account of the negligence of a conductor leaving cars on a track over which the fireman must pass in the discharge of his duties, was a fellow-servant of such fireman. (*Coleman v. Wilmington C. and A. R. Co.*, 25 S. C., 446.)

SOUTH DAKOTA.

The common-law doctrine seems to prevail in this State.

TENNESSEE.

In this State the common-law doctrine seems to prevail, but the decisions are somewhat conflicting.

An engineer in charge of a train was held to be not a fellow-servant of a brakeman on the same train acting under his orders. (*East Tenn., etc., v. Collins*, 1 Pickle, 227.)

Also a conductor was held to be a vice-principal as to other trainmen. (*Ill. Central Ry. Co. v. Spence*, 93 Tenn., 173.)

It was held that the engineer and hands employed on a locomotive are fellow-servants. (*Nashville and Chattanooga R. Co. v. Elliott*, 4 Cold, 611.)

TEXAS.

Chapter 91, laws of 1893, is intended to modify the common law, the title of which is "An act to define who are fellow-servants and who are not fellow-servants, and to prohibit contracts between employer and employees based upon the contingency of the injury or death of the employee, limiting the liability of the employer for damages."

But, notwithstanding this statute, the courts apparently draw largely on the common-law decisions to enable them to apply the principles of law relating to master and servant and coemployees.

UTAH.

This State has a statute defining who are fellow-servants, which declares that any person having superintendence or direction over another is not a fellow-servant with such employee. In other respects the common-law doctrine prevails.

VERMONT.

The common-law doctrine seems to prevail in this State; but the decisions are somewhat favorable to the injured employee.

WASHINGTON.

The common-law doctrine prevails in this State.

WEST VIRGINIA.

The common-law doctrine prevails in this State. And it was held that a conductor on one train and a brakeman on another were not fellow-servants. (*Daniel v. Chesapeake & O. R. Co.*, 36 W. Va., 397.)

WISCONSIN.

In 1893 the following law was enacted:

"Every railroad or railway company operating any railroad or railway, the line of which shall be, in whole or in part, within this State, shall be liable for all damages sustained in this State by an employee of such company without contributory negligence on his part.

"First. When such injury is caused by any defect in any locomotive engine, car, rail, track, machinery, or appliance required by said company to be used by its employees in and about the business of such employment, when such defect could have been discovered by such company by reasonable and proper care, tests, or inspections; a proof of such defect shall be presumptive evidence of knowledge thereof on the part of such company.

"Second. Or while such employee is engaged in operating, running, riding upon, or switching passenger or freight or other trains, engines, or cars, and while engaged in the performance of his duty as such employee, and which such injury shall have been caused by the carelessness or negligence of any other employee, officer, or agent of such company in the discharge of, or for failure to discharge, his duty as such. No contract, receipt, rule, or regulation between any employee and a railroad company shall exempt such corporation from the full liability imposed by this act."

UNITED STATES SUPREME COURT.

To the general rule as stated there are well-defined exceptions, one of which arises from the obligation of the master not to expose his servants, when conducting his business, to perils or hazards against which they may be guarded with proper diligence on his part, therefore it has no application to the character and condition or the appliances which are furnished for the use of the employees. Such duty is personal to the master and those who are performing duty are charged with the master's duty though they are employed in a distinct and independent department of the service. (*Hough v. Railway Co.*, 100 U. S., 213.)

As to fellow-servants, this court has held that a gang of men and their foreman were fellow-servants. Likewise that an engineer and fireman were fellow-servants. (*Baltimore and O. R. Co. v. Baugh*, 149 U. S., 368.)

It might be said that where cases have come into the Federal courts the common-law doctrine respecting the duties of master and servant and the doctrine of fellow-servant as known to the common law has generally been applied. Of course, where an injury occurs in a particular State that has a statute the Federal courts, if called upon to administer the law, as a general thing will follow the construction placed upon such statute by the State courts.

Mr SARGENT. I wish to say further that I appear here this morning on behalf of the organization which I represent, only. The other gentlemen, representing the organizations named in this answer, are ready at any time to come before the commission to answer any questions which the commission may see fit to put to them relative to their respective organizations, or the work done by the men whom they represent. I am here this morning to answer any questions which the commission desires to put to me, but I wish it understood that I am not here in the capacity of a representative of the five railway organizations.

Q. (By Mr. FARQUHAR.) Have you a regular scale of wages?—A. Yes; we have a published book of schedules which shows the rates paid to firemen on nearly all the railways of the country. The report of the Interstate Commerce Commission shows the wages of every railway employee by a table of statistics, which the commission will find a very valuable book. It gives each railroad and exactly what it cost to operate it, what it earns, what its engineers earn, what its firemen earn, what its brakemen and section men earn, and covers the whole list of employees.

Q. (By Mr. KENNEDY.) How much labor is there on railroads without giving rest on Sunday?—A. That depends entirely upon the section of the country. Throughout the New England States very little Sunday work is done. The trains there are usually run on Saturday night, and the men are relieved very early Sunday morning and during the day. Except some of the local trains in and out of the cities, the train service is nearly abandoned. That you will all understand if you will travel through New England and want to get anywhere on Sunday. In the West, however, we find the freight service, especially on Sundays, very active. This is due largely to the desire on the part of shippers to get their stock into the markets early on Monday morning. The stock trains on Saturday night start out and take advantage of Sunday and get into Chicago in order that they may deliver the stock early on Monday morning. So that the railroad men throughout the West are pretty busily engaged on Sunday. There are some trains, you will find, that are a necessity on Sunday. We have discovered that it is not the desire of the railway operators to run Sunday trains, but there is a demand for a certain amount of Sunday business, and the railroads have to meet that demand. The shippers of stock want their stock in the market early in the morning on Monday. To get it there it has to leave Omaha and St. Paul and those northern points Saturday night to be delivered, and therefore those trains have to be run. There has been a disposition manifested on the part of the railroad companies to abolish Sunday work just as far as they can do it, and there is a great deal less Sunday work done to-day than there was five or six years ago. The organizations have gone on record as against Sunday labor. The men want Sunday to be with their families; they think they should have it; they believe when they have worked six days there should be a day for rest, and that should be on Sunday. At the same time, they realize that there is a certain demand of the public which the railroad companies must respond to. Talk of taking off Sunday trains out of Chicago, for instance; those limited trains that run every day in the year for the accommodation of passengers! The public would rebel against it; they must be run. There must be a certain amount of transportation on Sunday that never can be overcome. We believe there should be and there is generally a disposition on the part of the railroad companies to abolish Sunday traffic just as far as it is practicable to do it.

Q. Are the employees who work Sunday given a day of rest out of the seven days?—A. That depends entirely upon the rush of business during the week. If business is light they may get a day lay-over during the week; but the way business is now on the railroads, men are doing 9 and 10 days a week. The men get a day's pay for a certain trip. Every time they make that trip it is a day. They get in two or three extra days a week by coming back on those trips. Each of those trips might consume from 9 to 12 hours.

Q. (By Mr. PHILLIPS.) Do they get two or three hours' sleep?—A. Sometimes they do not sleep at all.

Q. (By Mr. KENNEDY.) Is there a maximum number of hours fixed beyond which railroad firemen and engineers, for instance, shall not work in the 24?—A. We have a rule which is in force on many roads, where a man shall not be required to go out without 6 or 8 hours' rest, unless he feels disposed to go.

Q. (By Mr. FARQUHAR.) Is that not a matter for State legislation?—A. Yes; I believe the State could regulate that by law. At the same time take, for instance, the State of New York, where they have a law providing so many hours shall constitute a day. I think you will find upon investigation that the men work to exceed that time. Of course the company pays them overtime.

You can not put railroad men in the transportation department upon the same basis upon which men work at trades, in factories, and shops. The handling of transportation is an entirely different matter. For instance, I am called to-day to go out upon a run. I am on duty 36 hours before I am relieved. Certain conditions may arise, as have this year to my knowledge—storms and conditions of weather—whereby the men are on duty for 36 hours before they are relieved from their engines. Those are conditions that can not be controlled by any specified law or regulation. We believe that there is manifest on the part of the railways a disposition to be as fair and equitable in the establishment of hours of labor for train-service employees as is practicable with the business to handle. At the present time the railroads are flooded with business and the men are working constantly, you might say, many of them under very severe strain. If a man is not able to go out, does not feel that he can go, as a general rule he has no trouble in getting excused, if they have a man to place in his position. Oftentimes trains are held while the men get a sufficient amount of rest to go out and perform their duty.

Q. (By Mr. PHILLIPS.) Could that be obviated by employing a larger number of men, or is it difficult to get trained men?—A. No; you can get plenty of men. It might be obviated to a certain extent by increasing the number of employees and increasing the machinery, but when the dull time comes there would be that army of idle men. The men in the railway train service do not want an over-production; they do not want the railroads loaded down with a great army of men in order that they may have it easy the whole year round. They are willing to take it rougher and work a little harder in the busy season, and then when the dull season comes there is plenty of time to rest up and earn fair wages. The railroad employees have an understanding with the employers that there shall be no more men employed than is necessary to move the traffic with dispatch, and during the busy times they take advantage of it and earn big wages, and when the dull season comes, of course, they earn an average wage.

Q. (By Mr. CONGER.) Then, employees are generally satisfied and are not seeking additional legislation against long hours?—A. The train service with which I am associated, the firemen, are not seeking any legislation to reduce the hours in which they work. They have gone on record as against Sunday labor. They do not want to do Sunday labor when it is not an absolute necessity. They do not want these railroad corporations to work Sunday simply to accommodate themselves. They are willing to perform those duties which the public desire and compel them to perform. The agitation of the Sunday question on the railroads has reduced the amount of labor on Sunday to a marked degree all over the country. There are some sections of the country where the trains do not run on Sunday; neither come in nor go out. There are some small roads which do not pretend to work on Sunday where a few years ago everything ran. There is a disposition to hold trains on roads and not send them out, except where they carry perishable freight, dispatch freight, and live stock. Of course, you understand that now live stock takes precedence over humanity. Passenger trains are side-tracked for live stock trains. Livestock has precedence over first-class passenger trains, and I have gone out of Chicago on first-class passenger trains and seen stock trains on their way to New York pass us and we had to give way to them; they had the preference over everything.

Q. (By Mr. FARQUHAR.) Do the through freights run on the New England roads on Sunday?—A. Yes; what they call perishable freights; nearly all the local trains are tied up on Sunday. I have had some experience trying to get out of Boston on Sunday, and I have found it was a difficult thing to do.

Q. What are the relations between the operators and your brotherhood?—A. I have been associated with the Brotherhood of Locomotive Firemen as its chief executive for 14 years, and I have yet to find the first railroad officer with whom I could not do business and reach results that were acceptable to the organization which I represent. I can only speak for the firemen. To-day, throughout this entire country, we believe—and we form that belief from the treatment of our men and their readiness with which committees are received who wait upon the officers—there are pleasant relations existing between the firemen and their employers.

Q. Is there at times a little friction, over insurance matters for instance?—A. Friction breaks out between the railway employees and their operators just as it breaks out in church societies. Everything can not be expected to be peace and harmony at all times. I speak in general terms. We might single out certain instances in which we have had contention with railroad officers, and there are on record a few instances where the employees have withdrawn from the service; but to-day the relations which exist between the locomotive firemen and the railway companies of this country is of a most agreeable character, and we feel very well satisfied. We are reaping some of the rewards which patience brings, getting a little better wages in some localities since prosperity returned, and we hope to have better conditions. At the present time our men are earning good money, have plenty of work, and there is a demand for our men. One of the best evidences of the relations between the Brotherhood of Locomotive Firemen and the railway managers or operators is the fact that we are supplying a great many of our members to-day to the railway companies who are in need of experienced men; they telegraph to our office and ask us to supply the demand. That is an evidence of the feeling that exists between the companies and the organization. If they did not have respect for us and the work in which we are engaged they would not ask for our men to take service on their lines.

Q. (By Mr. KENNEDY.) What are the usual hours of labor of locomotive firemen?—A. The usual hours of labor of locomotive firemen are 10; 10 hours constitute a day's work. If we work to exceed 10 hours we get a pro rata wage for the extra work. There are some places where they work 11 and some where they

work 12, but the average hours of labor for the locomotive firemen are 10 hours or a run of 100 miles. If we run 100 miles that makes a day; if we make that run in 2 hours or 24 we get a full day's pay. When they make the run back the same day, they make 2 days in 1. We have firemen that make 2 days in 1 by having made 200 miles in 10 hours.

Q. Does your organization favor shorter hours?—A. Yes, and so far as possible we have established 10 hours. It used to be 12, and before the organization came into existence there was no limit to the hours. Men used to work 24 hours and only get 1 day, and 15 hours and get 1 day; but when the organization came into existence it began to establish a maximum day and we have been very successful in establishing the 10-hour rule.

Q. Do your sympathy and support go out to all organizations that are struggling for a shorter work day?—A. Yes, and our organization is on record in favor of the establishment of the 8-hour rule for all employees. At the same time we question whether we would be able to introduce that successfully on railroads in the transportation department; but in the shops and on the sections, and wherever the men could work on an 8-hour basis, we want it done and we have advocated it. I tried to introduce the 8-hour rule a few days ago, and I felt very much encouraged from the conversation I had with the officers of a company in regard to working the switching crews on the 8-hour basis. Possibly, after a while that may come about.

Q. (By Mr. RATCHFORD.) Do monthly payments to railway employees operate as an incentive to exacting longer hours and greater number of days in the month from the employee than would be exacted if the same employee were paid by the day?—A. Yes; unless there is a rule specifying what their hours should be.

Q. Does such a rule exist?—A. We have men employed as hostlers at \$90 per month. Their work is specified so that 12 hours constitute a day. And there are night men and day men; that fills in the 24 hours. There is a rule that they shall not work to exceed 12 hours a day, and if they work over that they get pro rata overtime. In the recent conference or settlement with the Grand Trunk, of Canada, the operators there were paid on the monthly basis and they have been compelled to work from 12 to 14 and 16 and 18 hours, just as the conditions of service required at the different stations. The schedule which has gone into effect and under which they work now provides a monthly salary and that 12 hours shall constitute a day, and if they work to exceed that 12 hours, they get overtime, which is added to their monthly compensation.

Q. In your paper you also made reference to the suspension of employees without pay. What are we to understand from the word "suspension" in the sense in which you used it?—A. It refers to an employee who was taken out of service for some alleged violation of the rules by an officer of the company and is held off for an indefinite length of time, and during that time, of course, no compensation is allowed him. He may be off 30 days; he may be off 60 days, and sometimes they have been off for 6 months. Investigation is finally held and he is returned to service. During that time he has had no earning capacity and we have believed that it was a gross injustice to railway employees, and the organizations have introduced a rule, which you will find in most of our schedules, that if a fireman is taken out of service, suspended, or discharged, he shall have a hearing within 5 days. If he is innocent, he shall be returned to service and paid for all time lost. By the establishment of that rule we have to a considerable extent lessened that evil of suspension. It still exists, however, among a great many of the different classes of employees, and that is what I think is referred to in that.

Q. In such cases is the employee paid the wages earned up to the date of his suspension?—A. He is paid up to the date he is taken out of the service. In days gone by if a superintendent or a train master did not feel just right, and an employee happened to do something that did not meet his views, he would send him home, and the employee might go around and try to get some knowledge of what their intentions were. He could get no information. He was kept out of service for an indefinite length of time—told that he was suspended. Afterwards he would be permitted to come back into the service. All that time has been lost. We believe that if a railroad employee is taken out of the service, he should know what he is taken out of the service for. He should be given an opportunity to be heard before his employer. If he can prove his innocence, he should be returned to service and paid for the time lost. If he is found guilty and 30 days' or so suspension is to be inflicted, we have a rule of punishment for offenses. A man may be suspended 30 days or he may be suspended 60 days for a specific violation of a rule, which violation has been determined after investigation.

Q. You referred also in your paper to the injunction order of Judge Jenkins being reversed by a higher court. What, in your opinion, was the effect of that

proceeding among the railway employees and upon injunction proceedings generally?—A. I can speak of the effect upon the railway employees. It created a spirit of rebellion among them. It was a dangerous act on the part of the judge, and came very near at that time bringing about the most serious complications in the Northwest that this country ever saw; and had it not been for the influence of those who were at that time directly connected with the organizations there would have been an uprising on the Northern Pacific Railroad which would have been more disastrous, in my judgment, than the one in 1894. You will understand that prior to the issuing of this injunction there was no agitation, no disposition on the part of railroad employees to involve the Northern Pacific Railroad in a strike. The company had issued a schedule to take effect on a certain day, without any consideration or regard for the employees with whom they had a schedule at the time. The contract, as it was termed by the employees, was then in effect. Without any consideration of this the schedule was issued. The men came forward, through their representative committees, to have a hearing with the management and with the receivers. While this hearing was in progress, while the committee was in session deliberating with the officers of the road, Judge Jenkins issued his order, in which he restrained the men from leaving the service of the company, with or without notice—one of the most far-reaching injunctions ever issued in the annals of the courts. I was served with that injunction in my own office in Terre Haute, Ind., and I had not been near the Northern Pacific property, had not even been called into consultation with the men, yet I was restrained from even advising or counseling with the men or performing the duties which my office required. The men resented any such injunction and were very much worked up over it. Immediately the officers of the organization went forward, counseled with the men, and got the injunction modified, and it pacified the men to a certain extent, but it was the beginning of what finally terminated in the revolution which occurred in 1894 in the Northwest. Had that injunction never been issued by Judge Jenkins there never would have been a strike along the line of the Northern Pacific on the part of the railway employees in the company's service, but the issuing of that injunction so incensed the men that even after its modification they still felt the sting, and in 1894 the strike took place, and I believe that it was largely caused by the injunction of Judge Jenkins.

Q. Did the injunction restrain you from counseling with your men?—A. Yes.

Q. Verbally, by correspondence, or otherwise?—A. Yes, sir.

Q. (By Mr. KENNEDY.) In discussing the liability of railroads for injury, etc., you said the employees have no choice in the selection of the men employed by the railway. Do you have a certain choice through having 80 per cent of the employees in your organizations?—A. In answering that question as we do, we speak of the employee as he is received into the railroad service. We have no choice as to the character or qualifications of the man who to-day applies to the Southern Railway for employment. We are not consulted in the matter, neither are the employees on the road consulted. Any man who makes application for employment to the motive power department or the transportation department is heard without any regard to the employees then in service. Of course there are men who are hired by virtue of their membership in the organization upon recommendations which come from the organization to which they belong or of former employers; but the employees directly employed on the Southern Railway have no voice in the selection of their immediate associates. For instance, you are a conductor; you go out to-day upon the road in charge of your train. The train master has hired two men. He does not consult you in regard to hiring those men. You report to go out on your train, and there are two men you have never seen. You do not know them. You know nothing of their qualifications. They are sent there with instructions to go out with you as your brakemen. That is what we desire to convey in that answer, that the employee has no choice in his associate employees. You go on the road and an accident occurs through the carelessness or the negligence or lack of ability on the part of one of those men assigned to you. You have had no choice in the selection of your crew. You had to take out whoever the company designated.

Q. Are these so-called voluntary relief associations looked upon by employees generally as a menace to their labor organizations?—A. Yes, sir; they are.

Q. Do they believe that the railroad companies in promoting them seek to divide the employees' allegiance in time of trouble between their unions and their insurance?—A. They do.

Q. There is a part of section 10 of the act of June 1, 1898, which says that no railroad company or corporation, etc., shall require any employee or person seeking employment as a condition of such employment to enter into a contract whereby such employee or applicant for such employment shall agree to contribute

work 12, but the average hours of labor for the locomotive firemen are 10 hours or a run of 100 miles. If we run 100 miles that makes a day; if we make that run in 2 hours or 24 we get a full day's pay. When they make the run back the same day, they make 2 days in 1. We have firemen that make 2 days in 1 by having made 200 miles in 10 hours.

Q. Does your organization favor shorter hours?—A. Yes, and so far as possible we have established 10 hours. It used to be 12, and before the organization came into existence there was no limit to the hours. Men used to work 24 hours and only get 1 day, and 15 hours and get 1 day; but when the organization came into existence it began to establish a maximum day and we have been very successful in establishing the 10-hour rule.

Q. Do your sympathy and support go out to all organizations that are struggling for a shorter work day?—A. Yes, and our organization is on record in favor of the establishment of the 8-hour rule for all employees. At the same time we question whether we would be able to introduce that successfully on railroads in the transportation department; but in the shops and on the sections, and wherever the men could work on an 8-hour basis, we want it done and we have advocated it. I tried to introduce the 8-hour rule a few days ago, and I felt very much encouraged from the conversation I had with the officers of a company in regard to working the switching crews on the 8-hour basis. Possibly, after a while that may come about.

Q. (By Mr. RATCHFORD.) Do monthly payments to railway employees operate as an incentive to exacting longer hours and greater number of days in the month from the employee than would be exacted if the same employee were paid by the day?—A. Yes; unless there is a rule specifying what their hours should be.

Q. Does such a rule exist?—A. We have men employed as hostlers at \$90 per month. Their work is specified so that 12 hours constitute a day. And there are night men and day men; that fills in the 24 hours. There is a rule that they shall not work to exceed 12 hours a day, and if they work over that they get pro rata overtime. In the recent conference or settlement with the Grand Trunk, of Canada, the operators there were paid on the monthly basis and they have been compelled to work from 12 to 14 and 16 and 18 hours, just as the conditions of service required at the different stations. The schedule which has gone into effect and under which they work now provides a monthly salary and that 12 hours shall constitute a day, and if they work to exceed that 12 hours, they get overtime, which is added to their monthly compensation.

Q. In your paper you also made reference to the suspension of employees without pay. What are we to understand from the word "suspension" in the sense in which you used it?—A. It refers to an employee who was taken out of service for some alleged violation of the rules by an officer of the company and is held off for an indefinite length of time, and during that time, of course, no compensation is allowed him. He may be off 30 days; he may be off 60 days, and sometimes they have been off for 6 months. Investigation is finally held and he is returned to service. During that time he has had no earning capacity and we have believed that it was a gross injustice to railway employees, and the organizations have introduced a rule, which you will find in most of our schedules, that if a fireman is taken out of service, suspended, or discharged, he shall have a hearing within 5 days. If he is innocent, he shall be returned to service and paid for all time lost. By the establishment of that rule we have to a considerable extent lessened that evil of suspension. It still exists, however, among a great many of the different classes of employees, and that is what I think is referred to in that.

Q. In such cases is the employee paid the wages earned up to the date of his suspension?—A. He is paid up to the date he is taken out of the service. In days gone by if a superintendent or a train master did not feel just right, and an employee happened to do something that did not meet his views, he would send him home, and the employee might go around and try to get some knowledge of what their intentions were. He could get no information. He was kept out of service for an indefinite length of time—told that he was suspended. Afterwards he would be permitted to come back into the service. All that time has been lost. We believe that if a railroad employee is taken out of the service, he should know what he is taken out of the service for. He should be given an opportunity to be heard before his employer. If he can prove his innocence, he should be returned to service and paid for the time lost. If he is found guilty and 30 days' or so suspension is to be inflicted, we have a rule of punishment for offenses. A man may be suspended 30 days or he may be suspended 60 days for a specific violation of a rule, which violation has been determined after investigation.

Q. You referred also in your paper to the injunction order of Judge Jenkins being reversed by a higher court. What, in your opinion, was the effect of that

Q. (By Mr. FARQUHAR.) Is it a fact that the desire very often of operators of railroads where these benefit organizations are would naturally be to try to bring the employees nearer to them in interest by making propositions of insurance or uniting with the employees and securing better insurance? Is it not a matter of self-interest on the part of railroad operators to do that?—A. The fair railroad operator who is most solicitous of his employees is always willing that they should obtain the benefits of insurance from such sources as they prefer. The record these organizations have made, the Brotherhood of Locomotive Firemen having paid \$6,000,000 to its crippled and maimed, and widows and orphans of those who have been killed, satisfies the railroad operator that the insurance which the firemen get through their organization is a far better benefit to them than any insurance that the railroad company could possibly introduce. Hence they do not encourage, and they do not desire to introduce, the relief scheme. But you find a railroad operator who looks upon these organizations as institutions that ought to be crushed because they presume to have too much to say about the hours of labor, the wages, and the rates under which men shall work, the man who does not appreciate the value of these organizations, scheming to introduce some plan whereby he can have a hold upon his employees. While he comes out in that philanthropic way, with his paternal care for his family, his ambition is to keep those men out of these organizations, because he prefers that the men in his employ shall not have the advantage of the insurance of the organizations, and that he be not required to meet and treat with them in such affairs as wages and the hours of labor and the rights of the men. That is my observation.

Q. Are your beneficial and relief associations operated as cheaply, and do they give equal or better benefits, as do the usual paternal organizations?—A. The Brotherhood of Locomotive Firemen stands to-day, acknowledged by all the insurance and fraternal societies of the world, as furnishing insurance at a cheaper rate than any other institution known to man. That is a statement that has been made by the insurance experts and by the representatives of fraternal societies. The men joining the Brotherhood of Locomotive Firemen, in the first place, have to pass a rigid medical examination, as rigid as any old-line insurance company that you can name. Upon his admission into the order he takes out his policy of \$1,500 or \$1,000. The cost last year for carrying that insurance policy, meeting all the deaths and disabilities which have occurred in our organization, for the \$1,500 policy, has been \$16 to the individual member.

Q. (By Mr. KENNEDY.) What would it cost him in the locomotive engineers' organization?—A. In the locomotive engineers' organization it would be considerably larger, on account of their large death rate. We have this advantage, which no other organization has: The fireman enters the Brotherhood of Locomotive Firemen and takes out his insurance; he remains with us, say, 5 or 6 or 8 years; he is promoted to be a locomotive engineer; he steps from our organization into theirs; they have an insurance; he drops the insurance of the Locomotive Firemen and takes it up in the Brotherhood of Locomotive Engineers; a young man fills this man's place; so that we have all young, able-bodied men, in the full vigor of life. After they have been with us a few years they step into the other organization; so that we are virtually made up of young blood.

I want to go a little further on the insurance question. We pay not only for deaths, but for the loss of a hand above the wrist, a foot above the ankle, blindness, consumption, paralysis, Bright's disease of the kidneys. Name me an association or an insurance society in the world that has as liberal a policy for its insured members. There is not one. The risks which we take are most hazardous, and next to the risk of the brakeman. With the automatic couplers and safety appliances the risk on the brakemen has been considerably reduced, while that on the firemen has not been reduced at all. None of these organizations pay for any such disabilities as we pay for. The engineers only pay for the loss of life and the loss of eyesight, and you will find on investigation that the firemen's insurance is a remarkable one, and a great many have asked how we could carry our insurance as we do. You understand, it is because of the young blood.

Q. (By Mr. FARQUHAR.) In the general paper read there was a statement made as to out-of-work benefits. What are they?—A. We have in our local lodges what is known as weekly benefits. A man is out of work and has not the means for his support; there is a weekly contribution made out of those funds for his maintenance and the maintenance of his family. A great deal of money is paid out in that way. That is not taken into consideration in our insurance at all. That is an outside feature. We have sick benefits. If a man is sick, he is paid so much a week during his sickness.

Q. (By Mr. KENNEDY.) Are there benefits in any of the orders for members who have become too old to work?—A. I believe the Brotherhood of Locomotive

Engineers has something of that kind. We have never had that, because we have no old men with us.

Q. If the members of your order could exercise their free will, would they go en masse into your benefit societies and let the companies' associations severely alone?—A. The locomotive firemen in this country are practically all members of the Brotherhood of Locomotive Firemen, regardless of reliefs or any insurance schemes which the companies introduce; we have practically over 29,000. If you will take the statistics of the Interstate Commerce Commission showing the number of locomotive firemen employed, you will find we have nearly the entire number in our organization. You will find, if you have the sentiment of the men employed on these railroads where they have voluntary relief associations, they would tell you that they have done a great deal of good in many instances. There are some features about the voluntary relief which the men would probably speak well of; but if they were given their own option in the matter, the railroad companies would have no insurance features whatever; they would much prefer not to have anything of that kind in connection with the employment on the railroad. I would ask the commission, if it has not already looked into this matter, to make some inquiries in regard to hospitals which are provided by the railroads. That is a feature that is very commendable where it is honestly conducted. The road on which I was employed, the Southern Pacific, has its hospital, and every month a certain amount is taken out of the employees' wages—firemen, for instance, 50 cents—and that is placed in what is known as the hospital fund. If a fireman is taken sick or injured, he is cared for at the hospital, and all his medical attendance and nursing and treatment is given him. In a country like Arizona or those Western countries along the line of those overland roads, the hospital feature has been very acceptable to the men and they take an interest in it. The roads there have shown a very fair disposition by electing from the ranks of the men members of the hospital board, and the men feel that they have a representation in the management and direction of the affairs of the hospital feature; but in the insurance features the men are not represented in that way, as a general rule.

Q. (By Mr. PHILLIPS.) Do the railroads contribute to the hospital fund?—A. I think all railroad employees contribute according to their wages, and I presume that would affect the president.

Q. Would it affect the president and the managers as well?—A. The president and the managers and all the officers are assessed so much a month, according to their salaries. The fund becomes enormous, and, of course, in some instances it has created a good deal of trouble. A little over a year ago the Union Pacific hospital department was severely overhauled by the telegraphers, and it was before the courts. It will be very interesting to look up that case, and you will get some valuable information as to how that particular feature is arranged. There the trouble was due to mismanagement. The funds of the men, which were supposed to be devoted to hospital advantages, were diverted, scandal arose, and the court overthrew the hospital department and ordered the money paid back to the men in proportionate shares.

Q. In what State was that?—A. That was along the line of the Union Pacific Railroad. I think the case was heard before Judge Sanborn in St. Paul. The hospital feature and the insurance feature should be kept distinct and apart, because they are two different propositions.

Q. (By Mr. FARQUHAR.) Have you in or near Chicago a home for aged railway employees?—A. Yes; the organizations have a home at Highland Park, which is maintained by the voluntary contributions of members of the organizations. They have 22 inmates there at the present time—aged engineers, firemen, conductors, and trainmen.

Q. (By Mr. PHILLIPS.) Do all the organizations contribute?—A. Yes; every organization contributes freely and voluntarily toward the maintenance of that home. It is not compulsory. It is supported by the lodges. The ladies have their lodges, and they contribute largely to the support and maintenance of the home.

Q. (By Mr. FARQUHAR.) Do you know of a proposition made by the president and directors of the Illinois Central Railroad to employees to invest in the stock of the road, and on better terms possibly, than those on which the common stock is offered?—A. We have a large number of our members who are employed on the Illinois Central Railroad who have shares of stock, and it is regarded as very acceptable. There is no railroad company in the United States to-day where there are more pleasant and harmonious relations existing between employer and employee than on the Illinois Central, and we believe it is working to a good advantage. A man who is interested in a concern will naturally take a little more interest than though he had no investment there. That is natural. If we enter

into a little business and all put in our mite we all feel that we have a personal interest in the success and prosperity of the property, and I believe the employees on the Illinois Central to-day, who know that their affairs are properly handled, that they are fairly treated, paid good wages, and that their organizations are encouraged take more interest in the success of the carrying on of the business of the Illinois Central Railroad than they otherwise would. That has been my observation.

Q. (By Mr. KENNEDY.) Some time ago Mr. Moseley, secretary of the Interstate Commerce Commission, was before this commission. He submitted five proposed laws in the interest largely of the railroad workers of the country. The first one is "An act to secure harmony in decisions of State and Federal courts." It is a brief one, and it is the only one I shall read in full [reading]:

"An act to secure harmony in decisions of State and Federal courts.

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the decisions of the courts of last resort in the several States shall, except where the Constitution, treaties, or statutes of the United States otherwise require or provide, be regarded as rules of decision in trials at common law in the courts of the United States in cases where such decisions apply, and no distinction in this regard shall be made between cases involving questions of general and those involving questions of special or local law."

Would such a law meet your approval?—A. We believe the enactment of this into a statute would be of great assistance to the railroad employees and avoid carrying a case from a State court to a Federal court where they can get a contrary decision. We believe the decisions should be uniform, in line with what this act provides, and I will say for the organizations that if this bill is introduced we shall give it our support, believing it will be helpful to us.

Q. The other one is to be entitled "An act to promote the safety of employees and travelers upon railroads, by compelling common carriers engaged in interstate commerce to equip their cars with automatic couplers and continuous brakes, and their locomotives with driving-wheel brakes, and for other purposes."—A. That we approve of, and we have already taken steps to have it introduced in the Minnesota and other State legislatures. The purpose of that is this: There are some roads that can not be classed as interstate roads. They do not run out of the State. They, however, connect with interstate roads and will be required to handle interstate cars. We think that that corporation should be required to equip its cars with safety appliances, so that the men employed on that road shall have the same security in the discharge of their duties on the rail as any other railroad employees, and that they should not have the privilege of dodging behind the technical point that they are not an interstate road; that whenever their cars are turned over to another road they should be equipped. We believe the enactment of that law in every State will avoid any of these differences arising.

Q. Would you approve a Federal law of the same character?—A. Yes. We have lots of roads out West that run but a few miles, but they connect with large trunk lines.

Q. Another proposed act is in line with what you said you were in favor of this morning, compelling railroads to give full and detailed information in regard to accidents and to send that information to the Interstate Commerce Commission.—A. We believe that that should be done; we believe that every possible authority should be given to the Interstate Commerce Commission, so that they can obtain complete statistics as to accidents and deaths and all the information that is necessary to be had. We pay them a big salary, and they ought to be able to do something that will benefit us.

Q. You are in favor of this proposed personal-liability law?—A. We have had that up for some time. We have been working on that line for several years. I can speak for all the associations on those measures, because we have discussed them among ourselves in conferences and they meet our views and approval. If they are introduced, we shall set our representatives to work to endeavor to bring influence to bear to have them passed. Their success will depend largely upon whether or not the commission here gives them favorable indorsement. What I want to impress upon the minds of the commission is this: We anticipate that these bills will be very carefully considered by the commission, and the approval by the commission of these bills would carry with it a great deal more weight than it would be possible for us to expect to carry; therefore we shall look to this commission for their opinion of these measures, and if the commission approves these bills we shall feel more satisfied, perhaps, than we would at present of the justice of them, and that would cause us to renew our energies to have them enacted.

We expect great things from this commission. Whether we will be disappointed or not remains to be seen. We anticipate that this commission, after it gets through its investigations, is going to present to Congress some recommendations which will be of great value to the working people of all classes—railroad men and all others who work for a living—and therefore we present these matters to you, as a basis of thought coming from us, with the hope that you will find much in them that is of value, and when you come to make your recommendations to Congress that we will find our suggestions formulated into measures that we can look forward to as being very helpful.

I think the Interstate Commerce Commission can be of great value to the country, to the railroads, and to the railroad employees, providing it is clothed with power to do something; but I have yet failed to discover wherein the Interstate Commerce Commission has got any power to do anything, except to go about the country and ask questions and get opinions when they can, and, if they can not, go without. I believe the Interstate Commerce Commission should have all the authority possible delegated to it by statute, so that when anything arises in which the transportation and railroad companies and the public is equally interested they should have the authority to go and investigate; to do those things that would remedy the evils which exist. That is the way I feel about the Interstate Commerce Commission. We have a great deal of regard for the commission. The railroad organizations were kindly treated by the commission 2 years ago, when the question of extending time on the application of safety appliances was considered. The railroads came forward and asked 5 years' extension of time. We protested against it. We appreciated the fact that it was necessary to extend the time, but not for 5 years. We were treated kindly by the commission, and we learned more of its workings at that time than we ever knew before. The commission is very valuable if it is clothed with authority. When you can only sit around a table and issue orders, and then, if the railroads want to carry them out do so, and if not ignore them, the commission is of very little value.

Q. (By Mr. PHILLIPS.) Do you think it has been of great influence so far?—A. They have done very good service.

Q. Even if they have no authority, has their moral effect been very beneficial to the railroad service of the country?—A. Yes, sir.

Q. (By Mr. KENNEDY.) Would you have the powers of the Interstate Commerce Commission enlarged in such a way that grievances of railroad employees against companies might be brought before it?—A. No; we do not propose to turn our affairs over to any such commission. We have gone just as far as we care to in regard to help from the Interstate Commerce Commission in the arbitration act. We want both the Interstate Commerce Commission and the Commissioner of Labor to use their influence so that a strike can be avoided. We do believe, however, that the Interstate Commerce Commission should compile annually statistics of wages, hours of labor, the number of employees on each railroad, and all conditions of employment, as a matter of reference, accessible to everybody. In case of grievances on any railroad, and if we should wish to make comparisons, we could turn to the Interstate Commerce Commission's record and find what every railroad in New England is paying firemen, number of hours work, wages, etc. We believe that authority should be delegated to the Interstate Commerce Commission. We believe this belongs to the commission. I presume these statistics are partially compiled by the Commissioner of Labor, but I believe that the railroad part of it should be in the hands of the Interstate Commerce Commission, because they have access, or should have access, to all affairs of a railroad. I believe railroads should submit these rates, and from such reports the Interstate Commerce Commission should compile tables, showing the wages of men employed on all railroads in the United States; that should be compiled yearly. If we had a yearly report, you could very easily turn to that and see what the wages are on all roads.

I believe the interests of railroad employees are best taken care of by the organizations to which they belong. Railroad men have faith in their organizations. The methods which these organizations have adopted are honorable and fair, and the course which we take in the adjustment of our disputes are commendable. Under the act to which you referred, which provides arbitration where the parties in dispute agree to it, the influence of the chairman of the Interstate Commerce Commission could be used to good advantage, and we believe that that is as far as we should go in that direction. We don't believe railroad employees' differences with their employers should ever be in the hands of the Interstate Commerce Commission to be disposed of; we don't have much faith in that way of settling disputes.

Q. (By Mr. PHILLIPS.) Have you had any case under the arbitration law which took effect in June, 1898?—A. Not under that law, but under the application

intended by it, during the last six months, there have been two cases on the Grand Trunk Railroad that have been settled by arbitration in line with what that law intends shall be done when the parties can not agree.

Q. Were they settled satisfactorily?—A. Yes; with satisfaction to both sides. Our organization was the first to be brought into the conflict with the Grand Trunk Railroad Company by the discharge of several of our members. The case was taken up; we pursued the matter until we could not agree. We then submitted to arbitration, and a decision was rendered in our favor. Shortly after that the question of wages came up with telegraphers on the Grand Trunk, and several telegraphers were discharged because of their prominence on the committee. The matter looked very serious for a time, but it resulted in an agreement to arbitrate. That question was settled satisfactorily; the telegraphers who were discharged were returned to the service, their wages increased and hours reduced, and a schedule made which was very acceptable to the men; and the board of arbitration were very unanimous in their award, regarding it as a successful affair. I was very sorry that did not happen in our country. It happened across the line, but, at the same time, it is carrying out the idea which that law is intended to carry out on the railroads of the United States, and I believe that it has demonstrated to the railroad managers in this country that arbitration is the proper way of settling these matters when they and the parties controlling the men can agree.

Q. Did the railroads make practically no opposition to the passage of the law?—

A. How could they? It would be against public sentiment. The public believe in settling matters by arbitration. How could they oppose a law of that kind? Is not that a just way to settle disputes? It was the railway organizations' policy as far back as during the strike on the C. B. and Q. The railroad organizations have always wanted arbitration.

Q. (By Mr. KENNEDY.) Is there any organization of the employees of the great express companies of the country?—A. They have an organization of express messengers, I think. I do not know how large a membership they have.

Q. Are they affiliated with your organization?—A. No, sir.

WASHINGTON, D. C., March 2, 1899.

TESTIMONY OF MR. H. T. NEWCOMB,

Chief of the Section of Freight Rates, Division of Statistics, United States Department of Agriculture.

The commission met at 11 a. m., Vice-Chairman Phillips presiding. Mr. H. T. Newcomb, chief of the section of freight rates in the Division of Statistics, United States Department of Agriculture, appeared as a witness. The vice-chairman stated that the witness would testify in regard to transportation, especially in connection with the agricultural industry. The topical plan of inquiry on transportation was taken up.

Mr. NEWCOMB. I would like to commence with the topical plan of inquiry on transportation at Division B of Part II, because it seems to me that the primary purpose for which we have our railway transportation system is the carriage of commodities; that the transportation of passengers is an adjunct to that, and that the relations of employees to the railways, however important they may be, should be treated in a way that can be assimilated to whatever treatment we find necessarily growing out of the relations between the transportation agencies, as carriers of commodities, and their patrons. Discriminations among persons, whether as producers or consumers located at single points, or as residents of different localities, or as manufacturers, producers, or consumers of different commodities, appear to me to spring almost wholly out of competition between the separate agencies which make up our transportation system, the competition that causes these discriminations usually being that between rival carriers which seek to perform identical services, each making bids to shippers for the privilege of carrying their commodities. Competition in its ordinary and usual form, as we all understand it, between sellers of a commodity, results in a series of offers which, if competition is free and open, finally result in a common price that is open to all. Competition among railways does not have that effect. The interests of large shippers are so prominent that it is decidedly profitable for the carrier to make a special effort to get their traffic as against the traffic of smaller shippers. There

is no minimum limit to the rates that can be made for specific services, and competition of this kind actually brings the rates, in many instances, very far below the cost of the service.

Q. (By Mr. NORTH.) Do you state that as a fact generally?—A. Not as a fact as regards the whole transportation system, but as regards the points at which there is competition among carriers offering to perform the same services. A great portion of the total railway traffic is not taken subject to that kind of competition, and thus arises a very prolific cause of discrimination. The rates are low at the points where actual competition exists and high at the points where it does not exist, because of the necessity of the carrier reconquing itself for losses at competitive points. In a progressive country like this, where we are requiring additional capital all the time for new transportation agencies, the rate can not permanently go much below the rate in other industries.

It would be very difficult indeed to overstate the detrimental effects of this kind of discrimination. Ability in business affairs becomes, in consequence of these practices, absolutely no safeguard against disaster in the conduct of industry. The man who can obtain these illegitimate favors from railroads has an advantage that can not be offset in any way.

Q. Is that done to the same extent now that it was formerly?—A. I think there has been very little improvement in that regard. There have been, since the interstate-commerce law was passed, occasional periods when discriminations due to rate-cutting were uncommon, and I might say, at the present time the published rates are quite well observed; there is said to be very little discrimination of this kind, and there has not been since the 1st of January. The railroads and the Interstate Commerce Commission have evidently gotten together and through some means an agreement has been reached through which it is hoped rates will be maintained. I do not look for any permanence of that condition. I do not believe, under the conditions of the law that imposes competition and prohibits agreement between carriers in regard to rates, that there can be any permanence in it. Traffic conditions are, however, unusually favorable just now and while they last any arrangement may suffice.

Q. Do you believe it is an evil beyond remedy?—A. Beyond remedy, unless the carriers are allowed to get together, and the interests of particular carriers in taking traffic away from their rivals is done away with entirely and the route traversed by shipments made as nearly absolutely indifferent as possible.

Q. (By Mr. A. L. HARRIS.) Would that be done by the pooling system?—A. Yes, in so far as the pooling system is effective it would. That is the only object of the pooling system.

Q. Has not that been forbidden and wiped out?—A. It has.

Q. (By Mr. PHILLIPS.) Provided there was a pooling system among the various railroads, would they not advance the price and eliminate competition through selfish motives rather than diminish it?—A. I am inclined to think that it would not, except in particular cases where the rates are already too low. The prices which the railroad can exact for a given volume of business is strictly limited by the necessity of moving the business. The railroad is always carrying for a great many people who are absolutely on the margin of profitable production, and any increase of its rates would tend to prevent the moving of that traffic. Then, we must always bear in mind that the low rate on competitive business is made to the few and at very few points, and often to very few shippers at those points; that a great majority of the patrons of the railroad have to give their business to a particular line, and that there is no competition as to them. The Iowa railroad commission, in 1878, after considering the question of the pool between Omaha and Chicago, reported that they considered it the only means by which the through business could be made to bear its just proportion of the fixed charges of the railroads.

Q. (By Mr. A. L. HARRIS.) If pooling is such a good thing, why should it be wiped out?—A. The testimony taken before the Committee on Interstate Commerce of the United States Senate previous to the passage of the interstate-commerce law does not show any particular desire for the prohibition of pooling, and I have not been able to find that any very definite or general sentiment of that kind has existed at any time. The men most acquainted with the nature of pooling agreements and their effect on transportation at that time, testified with practical unanimity in favor of an effective system of pooling under proper governmental supervision. The railroads at that time were asking that the Government supervise the pools. Mr. Albert Fink, at that time chairman of the Trunk Line Association, very strongly urged that the Government provide some effective supervision of those pools. Of course, one great defect was that the contracts were understood to be such as could not be enforced in the courts. No

carrier that I know of ever went to the courts seeking the enforcement of a contract of that kind. The pools were usually temporary affairs, and only one case of continuous operation during a long period is on record—that of the Chicago-Omaha pool.

Q. What is the real difference between pooling and what is known as joint traffic association?—A. The pools are of two classes, either agreements to divide business—that is, tonnage in which the tonnage is actually diverted is put into a pool, and if one receives more than its allotted proportion, the surplus tonnage is actually diverted to other roads; or of another class in which a deposit of money is made, generally subject to the order of a commissioner, and balances are settled by the transfer of a portion of the earnings from business in excess of that allotted. In the Trunk Line pool it was provided, I think, that 40 per cent of gross returns should be considered the expense of conducting the business, and that the remaining 60 per cent should be put into the pool and distributed according to the agreed percentages. The joint traffic association is popularly supposed to have been intended to accomplish the division of traffic in some manner that was never developed. It did not appear in the contract, and if they had any such intention it was never executed so far as public records show. You must remember that it was under fire from the start and if the managers ever intended to do anything of the kind they did not have any opportunity. The joint traffic association was never very effective in any way.

Q. (By Mr. RATCHFORD.) What has governmental management of railroads, under receiverships, to do with the matter under discussion; does such management encourage or discourage discrimination?—A. So far it has very clearly tended to encourage it. Roads under receivers have frequently been the worst rate cutters and most demoralizing to rate situations.

Q. Is it a fact that when railroads are not operated upon a profitable basis, and when the management of such railroads see that they are destined to fall into the hands of receivers, that discrimination, or cutting of prices, begins there in order to divert traffic to their road prior to a receiver being appointed?—A. I do not know of any specific instance of that kind. It may have happened. It does not sound unreasonable at all. I think it is altogether possible that something of that kind may have occurred in the last four or five years, during which the railroads have been expecting and hoping that Congress would make some modification in the antipooling clause of the interstate-commerce law. It may be that some of the roads have tried to increase their earnings with the specific purpose of obtaining large percentages in whatever pools may be created.

Q. (By Mr. FARQUHAR.) Is it a fact that in all the preliminaries before making a pool, it has been the uniform practice with roads that were competent at that time, through rolling stock, etc., to cut rates in order to get a large pro rata of the pool itself?—A. I think it has been done.

Q. Has it not been the trouble in the last 25 years?—A. The latter half of the last 25 years we have not had pools. Recently, I think (from the hope that they might soon be legalized), it has been a part of the trouble.

Q. Do you think that the roads themselves, after their pools are formed, have sufficient honor in their directories to sustain an honorable pool?—A. I would rather not put it that way. It is an historical fact, however we explain it, that pooling agreements have not been observed; that every pool has sooner or later broken down and been followed by a rate war, but so has every other situation among the railroads.

Q. (By Mr. A. L. HARRIS.) Why should it not be made a legal, binding contract?—A. That is precisely what I would desire to have done.

Q. (By Mr. FARQUHAR.) Were it possible under the interstate-commerce law, or any law we could make in this country, to legalize a pool, from your past experience and knowledge of the management of pools in this country, do you think there is sufficient honor among the railroads to sustain a pool?—A. I do not think that there is sufficient honor among any set of public men or business men anywhere to sustain any arrangement that is seriously contrary to their business interests, but I do believe that it can be made desirable for the railways, or a great majority of them, to maintain those pools most of the time.

Q. Can you propose any safeguard to make them observe the pool unless it has governmental supervision?—A. Simply the ordinary legal safeguard we have when we make contracts, that we can go into court and enforce them through damages or otherwise. I do not hope for any solution of the railway problem that will be satisfactory to everybody. I believe we can minimize the number of discriminations and that the legislation of the last few years—the antipooling clause of the interstate-commerce law and all legislation of a similar character—has tended to multiply discriminations.

Q. So you think if pooling were established it would lessen the faults?—A. Yes. I think the contract must take the form of a pool in some way. I do not think there is any use in being afraid of the word "pool" at all. We have what in common parlance we call a "railroad system." We find that it is not coordinated to such an extent as to be a system at all in many respects. One of the respects is this question of rates. We all realize that these rates should be equal and open, and we find one thing—the Interstate Commerce Commission has made it as clear as it can be made in the English language—competition, at the root of it. I believe the way to get rid of that condition is to get rid of competition as much as you can. You can not get rid of it entirely by any means short of absolute consolidation of the railroads.

Q. (By Mr. NORTH.) Would governmental supervision of the railroads accomplish that purpose?—A. I do not believe governmental supervision will do it. No governmental supervision has done it.

Q. Has it been done in England, Germany, or France?—A. In Germany the Government owns the railways and makes its own rates. In England they pool. In France they have divided the country territorially, so that there is no such thing as competition. In Belgium they had rate wars between the State railroads and the privately owned railroads, and they had discriminations, and finally the State railroads were compelled to go into pools with the other roads.

Q. (By Mr. FARQUHAR.) What is the relationship of those fast freight lines; for instance, the Blue Line and a dispatch company?—A. There are two kinds of fast freight lines. There is the fast freight line which is actually incorporated, or a joint stock company, doing business with special privileges over particular lines. There are other fast freight lines, like the Blue Line and most of those in existence, which are, in substance, merely names and trade-marks for particular routes. The latter are cooperative lines. Each road puts in a number of cars, generally proportional to its mileage in the route. For instance, there is a line from Boston to Chicago, formed by the Boston and Albany, the New York Central, and the Lake Shore and Michigan Southern; they put in cars in proportion to their mileage in that route, and they pay the expenses and divide the receipts in the same proportions. They have a common manager; they have joint soliciting agents; and it is simply a trade-mark or a means of securing business. Each important road has a great many fast freight lines, although there has been some effort lately to consolidate them; and we actually find the Michigan Central, the Lake Shore, the Pennsylvania, and such roads competing against themselves in the Chicago markets for business through their separate agencies of this sort. It is just another agency of competition.

Q. Do you refer to fast freight lines that are really owned by the roads themselves?—A. Yes; and I only recall two others—the Empire Line and the Merchants' Despatch; they are the only incorporated fast freight lines I recall now.

Q. That are not owned by the railroad?—A. Yes. There was a time when there were more, but they have gradually disappeared, and they are generally regarded by the railroad people themselves as bad things, although I presume that does not refer to the Pennsylvania line. Their line—the Empire Line—seems to be doing a good business in a good way.

Q. (By Mr. A. L. HARRIS.) Are the stockholders and managers of fast freight lines officers of the railroads?—A. I think that is one of the things that is past now; that was true at one time. I think attempts to make money by inside corporations of that kind have ceased entirely.

Q. (By Mr. FARQUHAR.) Is it a fact that old lines—the Blue Line and others—were at one time independent of the railroads in rates and made their own arrangements for equipment and everything else for the road?—A. I do not know of any lines existing now that were not always cooperative lines.

Q. Were the arrangements with those fast freight lines always satisfactory to the public and to the lines themselves? Was there ever any fault on the prorating of that class of freight?—A. I do not believe that has ever been a matter of importance to the general public.

Q. Did you ever hear of any public outbreak against the prorating that was formed by these lines at that time?—A. No.

Q. Was there such a thing as managing a prorating, and fairness in the transit of merchandise at one time?—A. Will you please tell me what you mean by prorating?

Q. Take the freight the Blue Line itself carried to Chicago from the East—every single line got its prorate from the Blue Line itself in the carriage of freight by its mileage. The Blue Line itself had to settle with the company.—A. That is prorating between connecting lines. I do not know that that is a subject in which the public has any particular interest. I do not know that there is any dissatis-

carrier that I know of ever went to the courts seeking the enforcement of a contract of that kind. The pools were usually temporary affairs, and only one case of continuous operation during a long period is on record—that of the Chicago-Omaha pool.

Q. What is the real difference between pooling and what is known as joint traffic association?—A. The pools are of two classes, either agreements to divide business—that is, tonnage in which the tonnage is actually diverted is put into a pool, and if one receives more than its allotted proportion, the surplus tonnage is actually diverted to other roads; or of another class in which a deposit of money is made, generally subject to the order of a commissioner, and balances are settled by the transfer of a portion of the earnings from business in excess of that allotted. In the Trunk Line pool it was provided, I think, that 40 per cent of gross returns should be considered the expense of conducting the business, and that the remaining 60 per cent should be put into the pool and distributed according to the agreed percentages. The joint traffic association is popularly supposed to have been intended to accomplish the division of traffic in some manner that was never developed. It did not appear in the contract, and if they had any such intention it was never executed so far as public records show. You must remember that it was under fire from the start and if the managers ever intended to do anything of the kind they did not have any opportunity. The joint traffic association was never very effective in any way.

Q. (By Mr. RATCHFORD.) What has governmental management of railroads, under receiverships, to do with the matter under discussion; does such management encourage or discourage discrimination?—A. So far it has very clearly tended to encourage it. Roads under receivers have frequently been the worst rate cutters and most demoralizing to rate situations.

Q. Is it a fact that when railroads are not operated upon a profitable basis, and when the management of such railroads see that they are destined to fall into the hands of receivers, that discrimination, or cutting of prices, begins there in order to divert traffic to their road prior to a receiver being appointed?—A. I do not know of any specific instance of that kind. It may have happened. It does not sound unreasonable at all. I think it is altogether possible that something of that kind may have occurred in the last four or five years, during which the railroads have been expecting and hoping that Congress would make some modification in the antipooling clause of the interstate-commerce law. It may be that some of the roads have tried to increase their earnings with the specific purpose of obtaining large percentages in whatever pools may be created.

Q. (By Mr. FARQUHAR.) Is it a fact that in all the preliminaries before making a pool, it has been the uniform practice with roads that were competent at that time, through rolling stock, etc., to cut rates in order to get a large pro rata of the pool itself?—A. I think it has been done.

Q. Has it not been the trouble in the last 25 years?—A. The latter half of the last 25 years we have not had pools. Recently, I think (from the hope that they might soon be legalized), it has been a part of the trouble.

Q. Do you think that the roads themselves, after their pools are formed, have sufficient honor in their directories to sustain an honorable pool?—A. I would rather not put it that way. It is an historical fact, however we explain it, that pooling agreements have not been observed; that every pool has sooner or later broken down and been followed by a rate war, but so has every other situation among the railroads.

Q. (By Mr. A. L. HARRIS.) Why should it not be made a legal, binding contract?—A. That is precisely what I would desire to have done.

Each important road has a great many fast freight lines, although there has been some effort lately to consolidate them; and we actually find the Michigan Central, the Lake Shore, the Pennsylvania, and such roads competing against themselves in the Chicago markets for business through their separate agencies of this sort. It is just another agency of competition.

Q. Do you refer to fast freight lines that are really owned by the roads themselves?—A. Yes; and I only recall two others—the Empire Line and the Merchants' Despatch; they are the only incorporated fast freight lines I recall now.

Q. That are not owned by the railroad?—A. Yes. There was a time when there were more, but they have gradually disappeared, and they are generally regarded by the railroad people themselves as bad things, although I presume that does not refer to the Pennsylvania line. Their line—the Empire Line—seems to be doing a good business in a good way.

Q. (By Mr. A. L. HARRIS.) Are the stockholders and managers of fast freight lines officers of the railroads?—A. I think that is one of the things that is past now; that was true at one time. I think attempts to make money by inside corporations of that kind have ceased entirely.

Q. (By Mr. FARQUHAR.) Is it a fact that old lines—the Blue Line and others—were at one time independent of the railroads in rates and made their own arrangements for equipment and everything else for the road?—A. I do not know of any lines existing now that were not always cooperative lines.

Q. Were the arrangements with those fast freight lines always satisfactory to the public and to the lines themselves? Was there ever any fault on the prorating of that class of freight?—A. I do not believe that has ever been a matter of importance to the general public.

Q. Did you ever hear of any public outbreak against the prorating that was formed by these lines at that time?—A. No.

Q. Was there such a thing as managing a prorating, and fairness in the transit of merchandise at one time?—A. Will you please tell me what you mean by prorating?

Q. Take the freight the Blue Line itself carried to Chicago from the East—every single line got its prorate from the Blue Line itself in the carriage of freight by its mileage. The Blue Line itself had to settle with the company.—A. That is prorating between connecting lines. I do not know that that is a subject in which the public has any particular interest. I do not know that there is any dissatis-

they pay no dividends at all and yet pay wages?—A. They have to hire labor in the market and pay market prices for the kind of labor they require.

Q. Do you think the water is paid for through wages?—A. I am certain that it is not paid for through wages, and I am also certain that it is not paid for through high rates. I do not believe it is in the power of most railroads to impose, I am certain it is not in the power of railroads to collect, a higher interest on money in the railroad business than the average amount collected in the other lines of industry. In explanation of that, the railroad carrying wheat from Minnesota to its market has to compete with railroads carrying wheat from other points. If it has wheat for export, it has to compete with transportation lines and producers in the Argentine Republic and Australasia and Russia and anywhere else where wheat can be produced, and the price the railroad obtains must be well within the price at which wheat is delivered in Liverpool. The railroad is always carrying for a large number of purchasers who are on the margin of profitable production. If the rate was raised a penny on the hundred pounds or a half cent on the bushel, sooner or later they would be forced out of production. The road is constantly meeting demands from other shippers who want lower rates in order to get into the market, and the tendency is downward rather than upward. It is said sometimes that the railroads raise their rates on agricultural products when prices are high. I can not speak for cotton rates; I have not studied them. For seven years with the Interstate Commerce Commission and four years with the Agricultural Department, I have watched the grain market with a great deal of care, and I only know of but one general advance in grain rates. In 1890 rates were reduced after a long investigation by the commission. Rates were generally reduced. What they called an emergency rate was put in, in order to save the producers, who were in a desperate condition on account of the low prices, and a part only of that reduction was put back in the following year, when prices were higher, and rates never got back to the point where they were before. Otherwise the rates have steadily declined. In a pamphlet published by the Agricultural Department on that subject I have gone into comparisons of that character, and have, I think, shown conclusively that the average rate obtained by the railroads in this country has declined very much more than the prices of agricultural products, comparing with the average for the years 1867 to 1872, using the average of these years as a basis.

Q. (By Mr. A. L. HARRIS.) On the gold basis?—A. On the gold basis; yes. The average rate per ton per mile charged by the railroads now is only 44 per cent of that average. That was for 1896, the latest year that could be given at the time the pamphlet was made up. The average rate of the railroads was 44 per cent of the average of the former years, and the average per cent of the price of wheat was 67. The average price of oats was 49, and rye 51; corn, 44; hay, 56; potatoes, 50; buckwheat, 53, and tobacco, 65. Of course, cotton could not be brought into that comparison, on account of the higher prices during the civil war.

In regard to 46, I do not wish to say anything except a word of remonstrance in regard to the common practice of supposing that the cost of a railroad as it exists now is to be measured by the actual cost of constructing the railroad at first. Most of our railroads have been built as cheaply as possible in order to enable them to handle traffic, and they have been improved afterwards, often by actually raising additional capital by selling more securities. The progress of our railway system from cheap roadbed, light rails, and poor equipment to heavy rails, good equipment, block-signaling system, and all that, has been accomplished after the roads have been put into operation. Terminals, tunnels, bridges, and other items of extraordinary cost that raise the average are usually omitted when people say that these railroads can be duplicated for \$10,000, \$15,000, or \$20,000 a mile. Our roads are all being rebuilt. Those that have not taken it up must do it.

The subject of taxation of railroads is a subject of great complexity. Scarcely any two States have the same system. Some try to tax them on their property just as other property is taxed. To tax them on net earnings is probably the only scientific tax. I am inclined to think that the State which taxes railways higher than they are taxed by other States discriminates against its own citizens by limiting the agencies by which they market their products—practically imposes an export tax on its own products. The tax is shifted to the shipper, and it is in the nature of the business that it must be shifted. The express company, the sleeping-car company, and the fast freight line all ought to be regulated as far as possible, just as railroads are. It was a mistake to leave them out of the original law.

Q. Are the tax laws in the different States upon railroad property uniform?—

A. No; there are scarcely two States that have the same tax.

Q. For instance, the State of New Jersey raises for State purposes about \$1,000,000, and other States assess upon the value of the property. Do other States help to pay the taxes of New Jersey because the shipper has to help pay the tax?—A. Of course, you have splendid illustrations in that case, where those expensive terminals exist in the State of New Jersey, and they can practically tax the people in New York and the West for State purposes in that way very effectively.

Q. Have you given any thought to the question of the unification of tax laws?—A. I have given a great deal of thought to it, but I have never seen a thoroughly practical method. I would like to call the commission's attention to the work of Prof. Henry C. Adams, *The Science of Finance*, and to his proposals in that direction. I am not myself in full agreement with him, but as far as State taxation goes I think I can most heartily approve his plan. I am doubtful as to the effect of the method by which he proposes to tax interstate railway companies for the benefit of the General Government, but if the tax was tolerably certain to be moderate I would favor it; but whether it might not be a dangerous tax, one that would retard the territorial division of labor, I am not yet prepared to express myself on that. It might be dangerous in that way. He gives a very comprehensive suggestion in that line and in the line of taxation generally. He proposes a system for all governments—includes everything, from municipal taxation to national taxation.

Q. (By Mr. PHILLIPS.) Is he connected with the Interstate Commerce Commission?—A. He is the statistician there, and professor of political economy in the University of Michigan.

Q. (By Mr. A. L. HARRIS.) Is that not a Government publication?—A. No.

Q. (By Mr. KENNEDY.) I would like to hear from you upon Government ownership of land transportation?—A. To my mind there are two practicable methods of dealing with the railway situation: One of these is the plan which has been adopted in England, and which has been so far tried in this country, but not thoroughly—the regulation of railroads by commissions having supervisory power, and perhaps mandatory power to a limited extent; the other way is absolutely to take hold of transportation agencies and operate them by the Government. We have undertaken the commission system, and it might be argued that we ought to give it a thorough test before adopting another; no such thorough test has been given it; the law has been in effect, now, since 1887, 12 years nearly, and the law has never been in satisfactory shape; it has always contained this clause which the present chairman of the commission has declared is directly antagonistic to the whole purpose of the law—the antipooling clause. It has always tended to perpetuate competition, while prohibiting the means by which competition is generally made effective. The result of that has been that the usual means have been resorted to, in violation of the law. In other words, the railroad business of this country has been conducted for some time on an indictable basis.

Q. (By Mr. RATCHFORD.) In either case are recommendations practically governmental regulations, whether it be managed by commission or by Government?—A. Yes. I think that is all there is to the question of governmental ownership; whether that is the most satisfactory expedient of regulation is the question. There are objections to the plan of taking over the railroads, and there are arguments in favor of it. It seems to me that the economic argument, as distinct from the political argument—that is, considering the way we may produce with the least expenditure of energy or the least "cost of production," as the economists say—is wholly in favor of the actual consolidation of the whole railway system. That is as far as the economist can take you. The question as to who shall own the consolidated system or who shall operate it is a political question wholly; and, to my mind, the question whether the Government shall own it is one to be decided by the way in which we regard our present administrative agencies. As a matter of course, we could not permit a consolidated railway to be owned by a private corporation. If we believe our present Federal agencies are developed to the extent that they could properly manage an agency employing nearly a million of men and collecting a revenue of more than a billion dollars annually, I should think the argument was decidedly in favor of Government ownership, provided regulation by commission should fail; but no adequate test of that has been made.

Q. (By Mr. C. J. HARRIS.) Have you, in your statistics, ever gone into the economy of private and public management of business? In other words, is not every line of business that is run by the Government nearly twice as expensive as it would be if conducted by an individual?—A. So far as that administrative question goes, I wish to say that it seems to me that it is absolutely fatal to the governmental ownership of railways at present.

Q. (By Mr. PHILLIPS.) How would it apply to the mail service?—A. The mail service generally is conducted on a better basis than anything else the Government does. I should say it would require the development of a generation at least to give us an administrative system in this country that could handle railroads even decently. We are spending in everything we undertake, unless it be in the postal service and possibly the Bureau of Engraving and Printing—in almost everything we undertake we are expending \$1 where 50 cents would be ample. It amounts to that in every agency of the Federal Government that I know of. I believe the proposition can not be overcome on other grounds, but we should unquestionably try the political expedient, which is simpler, at first, and that is through the exercise of the power to regulate interstate commerce by Congress.

I say the interstate commerce law is inadequate, and I would like to indicate in what way it could be improved: First, and as almost the only essential thing in that, I believe in the substitution for the present antipooling clause of a clause which will permit the railways to distribute their traffic among themselves according to agreed percentages, those contracts to be under the supervision of the Interstate Commerce Commission, to be public, and the commission to have power to require them to be suspended, or the rates to be changed, or the other practices corrected if found obnoxious to the public welfare. I do not care very much what shape that amendment takes so long as it embodies those principles. The railroads, ever since the law has been passed, have been urging that that be done. The House of Representatives has passed a bill once providing for it. A majority of the members of the Interstate Commerce Commission are understood to have approved it. The present chairman has approved it very heartily. In the last report he has put it very forcibly. It has been approved by the convention of State railroad commissioners; it has been approved by conferences of representatives of boards of trade and other representatives of municipal concerns. Mr. Reed has spoken in favor of it on the floor of the House. Senator Cullom has approved it, and every man who has made a thorough study of transportation, as far as I know. Judge Reagan, who drew and insisted upon the antipooling clause, has recommended it.

The opposition is of three classes: First, that coming from a small portion of the public that is still ignorant concerning the effect of competition in producing unjust discrimination and believes it to have substantial efficacy in regulating rates, and that it may even secure reductions in the general averages; second, from a class of railway officials who, while desiring pooling, object to measures providing for it, because they have also included amendments intended to strengthen the powers of the Interstate Commerce Commission, which they believe contrary to public policy; and, third, the really dangerous opposition comes from the trusts and powerful combinations of shippers who, through the control of enormous traffic, are able to dictate to the railways the terms upon which they will purchase transportation. These people are able to dictate rates to the railroads and get unfair profits and unfair advantages over their competitors from the necessity the railroad is under of taking traffic at whatever rates they are willing to pay. I will venture to say here, and if you will call railroad men and traffic men before you you will get more definite information from them—I will venture to assert that there has not been a rate on sugar from New York, Philadelphia, or any of the great refining cities, promulgated by the railroads within the last 10 years, that has not first been submitted to the sugar trust. And you can go right through the list of organizations of that kind in this country and you will find they are the ones that make the rates on their own products. The reason, as I believe, that the Patterson bill, providing pooling and increasing the authority of the Interstate Commerce Commission, was not passed in 1894 was the underhanded and secret opposition of the trusts. That being the situation, it seems to me that we ought to get whatever legislation legalizing pooling we can get, with so much other amendment to the interstate-commerce law as is possible. That law ought to be amended so as to give substantial finality to the findings of the commission. The commission investigates a case by methods similar to those adopted by the courts. It cites witnesses, and the parties are represented by counsel, having due notice, and all the regular forms of procedure adopted by the courts. It issues an order and the railroad refuses to obey it, and the commission, or some party interested, has permission to go to the court and seek a decree enforcing that order, and the court is instructed to proceed by rather less formal procedure than usual, but that does not amount to much, and the court goes into it and it declares it has the right to hear that case as a new case, and the commission's findings are simply *prima facie* evidence of the facts it found, and they are subject, like all *prima facie* evidence, to rebuttal. Very

Q. For instance, the State of New Jersey raises for State purposes about \$1,000,000, and other States assess upon the value of the property. Do other States help to pay the taxes of New Jersey because the shipper has to help pay the tax?—A. Of course, you have splendid illustrations in that case, where those expensive terminals exist in the State of New Jersey, and they can practically tax the people in New York and the West for State purposes in that way very effectively.

Q. Have you given any thought to the question of the unification of tax laws?—A. I have given a great deal of thought to it, but I have never seen a thoroughly practical method. I would like to call the commission's attention to the work of Prof. Henry C. Adams, *The Science of Finance*, and to his proposals in that direction. I am not myself in full agreement with him, but as far as State taxation goes I think I can most heartily approve his plan. I am doubtful as to the effect of the method by which he proposes to tax interstate railway companies for the benefit of the General Government, but if the tax was tolerably certain to be moderate I would favor it; but whether it might not be a dangerous tax, one that would retard the territorial division of labor, I am not yet prepared to express myself on that. It might be dangerous in that way. He gives a very comprehensive suggestion in that line and in the line of taxation generally. He proposes a system for all governments—includes everything, from municipal taxation to national taxation.

Q. (By Mr. PHILLIPS.) Is he connected with the Interstate Commerce Commission?—A. He is the statistician there, and professor of political economy in the University of Michigan.

Q. (By Mr. A. L. HARRIS.) Is that not a Government publication?—A. No.

Q. (By Mr. KENNEDY.) I would like to hear from you upon Government ownership of land transportation?—A. To my mind there are two practicable methods of dealing with the railway situation: One of these is the plan which has been adopted in England, and which has been so far tried in this country, but not thoroughly—the regulation of railroads by commissions having supervisory power, and perhaps mandatory power to a limited extent; the other way is absolutely to take hold of transportation agencies and operate them by the Government. We have undertaken the commission system, and it might be argued that we ought to give it a thorough test before adopting another; no such thorough test has been given it; the law has been in effect, now, since 1887, 12 years nearly, and the law has never been in satisfactory shape; it has always contained this clause which the present chairman of the commission has declared is directly antagonistic to the whole purpose of the law—the antipooling clause. It has always tended to perpetuate competition, while prohibiting the means by which competition is generally made effective. The result of that has been that the usual means have been resorted to, in violation of the law. In other words, the railroad business of this country has been conducted for some time on an indictable basis.

Q. (By Mr. RATCHFORD.) In either case are recommendations practically governmental regulations, whether it be managed by commission or by Government?—A. Yes. I think that is all there is to the question of governmental ownership; whether that is the most satisfactory expedient of regulation is the question. There are objections to the plan of taking over the railroads, and there are arguments in favor of it. It seems to me that the economic argument, as distinct from the political argument—that is, considering the way we may produce with the least expenditure of energy or the least "cost of production," as the economists say—is wholly in favor of the actual consolidation of the whole railway system. That is as far as the economist can take you. The question as to who shall own the consolidated system or who shall operate it is a political question wholly; and, to my mind, the question whether the Government shall own it is one to be decided by the way in which we regard our present administrative agencies. As a matter of course, we could not permit a consolidated railway to be owned by a private corporation. If we believe our present Federal agencies are developed to the extent that they could properly manage an agency employing nearly a million of men and collecting a revenue of more than a billion dollars annually, I should think the argument was decidedly in favor of Government ownership, provided regulation by commission should fail; but no adequate test of that has been made.

Q. (By Mr. C. J. HARRIS.) Have you, in your statistics, ever gone into the economy of private and public management of business? In other words, is not every line of business that is run by the Government nearly twice as expensive as it would be if conducted by an individual?—A. So far as that administrative question goes, I wish to say that it seems to me that it is absolutely fatal to the governmental ownership of railways at present.

with the Interstate Commerce Commission in every particular on theoretical grounds. On practical grounds I am willing to make concessions, and I believe the character of these concessions are best decided in the committees of the two Houses. I do not believe you would gain anything by what I might submit.

Q. Have they recommended anything in relation to uniform taxation?—A. That is outside of their province. There was introduced at the opening of the first session of the present Congress in the Senate, by Senator Cullom, a bill which is understood to contain the wishes of the commission. At the time that was introduced pooling was left out. Mr. Morrison was at that time one of the commissioners. I think at the present time if they drew one that pooling would be put in, but even then it was understood they were quite willing that the provision in the Patterson bill might be added. I think I am stating, in this particular, the views of the commission, although I do not represent them in any way.

Q. (By Mr. KENNEDY.) Have you noticed that the Senate has abandoned all the remedial legislation proposed by the Interstate Commerce Commission with the single exception of the antiscalpners' bill?—A. I knew that it had been done.

Q. Does there seem to be much hope of getting anything?—A. There has been disagreement among the railroads as to what concessions they were willing to make in regard to legislation, and I think that has stood in the way. Those differences have almost disappeared. It is understood that one prominent railroad sent its agents here and opposed the passage of the Patterson bill when it was thought it might come to a vote in the Senate, and I believe that is true. There have been very unfortunate differences of that kind among the railroads on account of the demand for substantial changes in the other portions of the law. I think it would be well to do whatever is necessary in order to get the railroad people themselves to unite in favor of legislation. Of course, if you get the legislation you have not got the pools, and have no great certainty that you will be able to get them, but we hope that the various financial interests will concentrate their influence in such shape as to prevent further competition where pools are practical. This (pooling) is not a panacea; it is not a remedy that is going to cure everything, and it is not a remedy that is going to prevent discrimination altogether, but I believe it is going to prevent much of it.

In regard to the taxation of the railroads, it is believed that the only altogether just method of taxing the railroads is to tax the net earnings. Of course, if that means is adopted, some method by which net earnings on interstate business can be separated from net earnings of State business must be adopted. That involves statistical agencies, probably those of the interstate Commerce Commission.

Q. (By Mr. A. L. HARRIS.) May that in many States require amendments to the constitutions?—A. I suppose that is possible.

Q. (By Mr. FARQUHAR.) Is it generally the custom in the Western States to attempt to tax railroads on gross receipts?—A. Several States tax them on gross receipts.

Q. Would there be any difficulty between taxation by the National Government and by the States?—A. Yes; of course. Grave difficulties are in the way of a uniform system, on account of limitations in our State constitutions. A great many of our States have distrusted their legislators, so that they have tried to tie them up in every possible way. It is one of the most unfortunate results of that practice.

Q. (By Mr. RATCHFORD.) Why do you think that railroad property should be taxed on net earnings?—A. The tax on the property of a railroad seems to be an impracticable tax on account of its character and on account of the relation of the franchise to its visible property, and the fact that it is a double tax, if you attempt to reach personally also and tax stocks and bonds in the hands of their owners. It may promote such things as are suggested, where New Jersey was able to tax terminals and thus tax the people in other States. A tax on gross earnings is objectionable because it may make it of advantage to the railroad to maintain high rates and a smaller total of gross earnings than if they were not taxed. That is purely a mathematical question. It may enable a railroad to obtain a larger net income by maintaining high rates and doing a small business with a lower percentage of operating expenses to gross earnings than by doing a larger business at lower rates with a greater total of earnings and a higher percentage of expenses to the gross returns.

Q. (By Mr. FARQUHAR.) Do you believe the same rule of taxation should apply to the farm, the mill, and the factory?—A. I do not; I do not believe they are to be regarded as constituting homogeneous property; they are employed for such different purposes. I would favor a general real estate tax. I believe it would be entirely to the advantage of the farmer to get rid of all taxes on personal property as such. They bear most heavily on the localities where there is the least personal property. I think the labor commission of the State of Illinois has shown

that conclusively in a very elaborate study. I think it is true also in Ohio. The tax has been very disadvantageous to the farmers.

Q. (By Mr. A. L. HARRIS.) Would you exclude improvements from taxation?—A. No; I am not an advocate of that.

Q. (By Mr. SMYTH.) Then you do not believe in the single-tax theory?—A. Not as that word is used. I do not propose that as the only tax, either, so far as the general property tax goes. I would not have that. I would substitute for that a general real estate tax and other tax. If street railroads continue to be operated independently in our cities, I would have a franchise tax; and I certainly should not do away with internal-revenue taxation. It is a very satisfactory means of taxation, and easily collected.

Q. (By Mr. RATCHFORD.) Is the difference, in your opinion, between the two methods due to the relation of the property to be taxed to the public?—A. The distinction in the method of treatment, you mean? If you mean that, I would say it is in the relation which the property bears to the man who owns it.

Q. Do you believe the same methods of taxation should apply to the farm, the mill, and the factory that apply to railroad property?—A. No.

Q. Is your belief on that point founded on the relationship which the public bears to the property to be taxed?—A. Both on that and the relation which the property has to other capital; that is, products employed for the creation of other products. The criterion for a tax, it seems to me, is the ability of the man called upon to pay it; that may be one thing to a farmer with a small farm, finding it difficult to earn wages for himself, let alone any interest on his capital, and a very different thing to the owner of a very productive factory, who is perhaps the owner of a patent, or in some other way able to obtain a monopoly price for his goods. He should be taxed very differently. I should say that a tax which would adjust itself to an income is a proper tax; but that is not an income tax, because incomes are different. If you have an income derived from investments, stocks and bonds, and I have an income obtained from delivering public lectures, they are very different. Yours is permanent; mine depends upon my health, conduct, and various other things, and I should not be taxed as high on mine as you on yours; and I think that excludes a nondifferentiated income tax—if that character of analysis were carried out in the direction I have indicated.

In regard to the general subject of agriculture, I would like to say that a great difficulty, and one fruitful cause of complaint against the railroads, has arisen from the fact that our public-land system induced producers to go beyond the region of profitable production. They were lured by a system which appealed to the land hunger of the Anglo-Saxon race, and called them out there, and they have had a loss to divide and not a profit. The railroads themselves were taken out there by land grants which were uneconomic, and many of the evils were produced by bringing producers where producers should not have gone for generations.

I have a very strong belief that the great difficulty with the farmer, aside from that I have indicated, is that the farmer constitutes an industrial class by himself. The Western farmer particularly has been lured out there, and society is rather responsible for his being there and must pay the penalty in hearing his complaints and in finding some way to make things easier for him. The other difficulty of the farmer is the lack of organization—the lack of knowledge of his own industry—and what can be done is in the line of the work that the Department of Agriculture is doing now. It is a general bureau of information for the farmers, and it should study market conditions statistically, as it does scientific methods of agriculture, and bring all those facts and methods home to the farmer in the plainest possible way, and help him in every practical way. It should be to the farmer what the associations of bankers and the railroad associations and all those other things are to industries in which individuals have the power and means of combination. I do not mean combination to monopolize their product, but combination to study their business. Development lies along that line. Strengthen our Federal agencies and our State agencies. That line of thought has suggested to me a study of the effect of speculation in food products. Of course I am engaged on the statistical work of the Department of Agriculture, and a large portion of our work is to promulgate from time to time estimates of crop conditions, and we continually hear from farmers who tell us that our work has only been helpful to the speculator, and I think it has been believed at times in the Department that that work could not help anybody but the speculator unless we were able to put our estimates in the hands of the farmer himself before or as soon as they can be had by the speculator. I hold that that is utterly impracticable. We can not reach the farmers by telegraph, and speculators, as a matter of fact, get the information by telegraph. We can post estimates in the post-offices and public places,

as the Weather Bureau does its prognostications, but even that will be after the speculators have read them in the daily press.

Q. (By Mr. A. L. HARRIS.) Are you able to get prospective views on the crops?—A. Yes.

Q. (By Mr. FARQUHAR.) Are they made monthly?—A. Yes; except during the winter months. On the 10th of March (1899) we give a report covering the distribution—that is purely a statistical inquiry that does not relate to prospects—but next month we give our first report on prospects of winter grains, and from then to the time when the grains are harvested we give out estimates of the probable production. They are not expressed in estimates of bushels, but in estimates of percentages of a normal crop; but, as I said, it has often been suggested that these reports are only beneficial to the speculators, and the Department, under the administration of Mr. Morton, I believe, thought that the only way to make them beneficial was to put them in the farmers' hands. The statistical study of grain prices for a very extended period will show, however, a smaller difference now between harvest prices and the price in early spring, before the new crop becomes available, than there was 35, 40, or 50 years ago; and the reason of that is the creation of exchanges where there is a continual market. The speculator also has a definite function in the way of being an expert estimator of the probable value per unit of quantity of the succeeding crop.

Q. (By Mr. PHILLIPS.) How do you get accurate information in regard to crop prospects in the various States?—A. We have a very elaborate system of correspondence; we have about 60,000 correspondents who furnish voluntary reports.

Q. (By Mr. SMYTH.) Is it all very much a matter of guess?—A. They are mostly farmers.

Q. (By Mr. KENNEDY.) Township correspondents?—A. Yes. I think the estimates we give are generally good. It surprised me 4 years ago, when I first commenced to handle the thing, how much care and intelligence they put in it for nothing.

The man who buys grain performs a function in distributing. He is a capitalist. Several of them get together in an exchange; they consider all the conditions they can find—the more the better—and they estimate the prospective value of the crop, and the investor who distributes his purchases over different systems of road profits by their knowledge. No matter how depraved speculators may be—practical gamblers—they want to get all the facts they can obtain, and if we let out the report and it does not reach anybody but these men, if it removes indefiniteness it removes some of the difference between the harvest price and the price when the product is marketed, and that benefits the farmer.

Q. (By Mr. A. L. HARRIS.) Do the grain dealers in the grain centers have a system of collecting statistics that is almost equal to that of the Department?—A. I think not. I think their system is not worth much at all except as they are able to correct it every month from what we give them.

Q. Do they correspond with grain dealers in almost every town in the United States where grain is sold?—A. I doubt it. I do not believe we know very much about these independent sources of information. To correspond with all the grain dealers would be very expensive, and to tabulate the reports after they were received would be expensive. I think those men are mostly men who have been in our Department at one time or another. I think most of them are well acquainted with the grain trade and can make shrewd guesses without much foundation.

Q. Are your reports put in the papers?—A. Yes; given to the Associated Press on the afternoon of the 10th, and telegraphed all over the country.

Q. And in that way reach the producer?—A. Yes.

Q. (By Mr. FARQUHAR.) Is it a fact that in all the great grain markets like Chicago the price lists carry the entire sales of the day—carry the entire visible supply of grain, and that even these reports, which are to regulate prices, are supplemented by private circulars by the whole of these great grain commission men of the country?—A. Yes.

Q. Do you think the information that comes through these price lists, the daily newspapers, and the private circulars, comprehend all that needs to be known as to the regulation of prices?—A. I should not say that. I should say, Get all the facts you can. The more you get the better. The more thoroughly you eliminate the speculative element the more accurate information is obtainable, and the higher prices the farmer gets.

Q. Do you think the stability of railroad rates is one of the best things the farmer and producer can have?—A. It is absolutely necessary. Fluctuating rates would be like a fluctuating tariff.

Q. Does it give an opportunity to the speculator and gambler?—A. Yes.

Q. (By Mr. A. L. HARRIS.) What have you to say on topic 43, Part II (Increase

that conclusively in a very elaborate study. I think it is true also in Ohio. The tax has been very disadvantageous to the farmers.

Q. (By Mr. A. L. HARRIS.) Would you exclude improvements from taxation?—A. No; I am not an advocate of that.

Q. (By Mr. SMYTH.) Then you do not believe in the single-tax theory?—A. Not as that word is used. I do not propose that as the only tax, either, so far as the general property tax goes. I would not have that. I would substitute for that a general real estate tax and other tax. If street railroads continue to be operated independently in our cities, I would have a franchise tax; and I certainly should not do away with internal-revenue taxation. It is a very satisfactory means of taxation, and easily collected.

Q. (By Mr. RATCHFORD.) Is the difference, in your opinion, between the two methods due to the relation of the property to be taxed to the public?—A. The distinction in the method of treatment, you mean? If you mean that, I would say it is in the relation which the property bears to the man who owns it.

Q. Do you believe the same methods of taxation should apply to the farm, the mill, and the factory that apply to railroad property?—A. No.

Q. Is your belief on that point founded on the relationship which the public bears to the property to be taxed?—A. Both on that and the relation which the property has to other capital; that is, products employed for the creation of other products. The criterion for a tax, it seems to me, is the ability of the man called upon to pay it; that may be one thing to a farmer with a small farm, finding it difficult to earn wages for himself, let alone any interest on his capital, and a very different thing to the owner of a very productive factory, who is perhaps the owner of a patent, or in some other way able to obtain a monopoly price for his goods. He should be taxed very differently. I should say that a tax which would adjust itself to an income is a proper tax; but that is not an income tax, because incomes are different. If you have an income derived from investments, stocks and bonds, and I have an income obtained from delivering public lectures, they are very different. Yours is permanent; mine depends upon my health, conduct, and various other things, and I should not be taxed as high on mine as you on yours; and I think that excludes a nondifferentiated income tax—if that character of analysis were carried out in the direction I have indicated.

In regard to the general subject of agriculture, I would like to say that a great difficulty, and one fruitful cause of complaint against the railroads, has arisen from the fact that our public-land system induced producers to go beyond the region of profitable production. They were lured by a system which appealed to the land hunger of the Anglo-Saxon race, and called them out there, and they have had a loss to divide and not a profit. The railroads themselves were taken out there by land grants which were uneconomic, and many of the evils were produced by bringing producers where producers should not have gone for generations.

I have a very strong belief that the great difficulty with the farmer, aside from that I have indicated, is that the farmer constitutes an industrial class by himself. The Western farmer particularly has been lured out there, and society is rather responsible for his being there and must pay the penalty in hearing his complaints and in finding some way to make things easier for him. The other difficulty of the farmer is the lack of organization—the lack of knowledge of his own industry—and what can be done is in the line of the work that the Department of Agriculture is doing now. It is a general bureau of information for the farmers, and it should study market conditions statistically, as it does scientific methods of agriculture, and bring all those facts and methods home to the farmer in the plainest possible way, and help him in every practical way. I hold that that is utterly impracticable. We can not reach the farmers by telegraph, and speculators, as a matter of fact, get the information by telegraph. We can post estimates in the post-offices and public places,

Q. (By Mr. PHILLIPS.) Was that figured in gold?—A. All the figures in this pamphlet are in gold.

Q. (By Mr. SMYTH.) Have you information relating to the South Carolina railways?—A. Yes; I have the South Carolina Railway as far back as 1872. It secured 3.254 cents in 1872, and 1.160 cents in 1897. I have some comparisons of passenger rates, if you care to have me put them in.

Q. Do they show about the same decline?—A. Not so much decline. The development there has been in the character of the service. You go faster and safer, and you have to pay for it.

Q. (By Mr. RATCHFORD.) Do the figures you have given on rates in 1897 show that the transportation of agricultural products on some of the Western roads was still cheaper than between New York and Chicago? The Milwaukee and St. Paul, I believe, was \$.006.—A. I was giving you general averages on all their business. Even then I think that would hardly hold true. I think that grain rate from Chicago to New York, and the other rates dependent upon it on the percentage system, which makes nearly all the rates throughout the country on grain dependent upon it, is one of the lowest rates, outside of some of the rates on bituminous coal. It is one of the lowest rates for railway transportation. This year it has been extremely low.

Q. Can you give us any information on the effect of so-called corn and cotton gambling?—A. I tried to take that up a little while ago. It seems to me that the whole effect of speculation is to even prices, to approximate the harvest price to the price at the time the crop is nearly exhausted, and in that way it is beneficial to the farmer. Of course when it takes such abnormal forms as it did last year for a period it will be detrimental, but that is an evil which must be borne occasionally for the sake of the general benefit.

Q. What is your opinion in regard to its effect upon prices for the world?—A. None at all, unless it is to average them.

Q. Where are the prices of farm products fixed?—A. Fixed at the point where the marginal increment of the necessary supply is produced. The man to whom it costs the most to produce—he who contributes the last amount that is required to make up the entire supply demanded by the world—fixes the price. If he did not get his cost of production he would go out of business, and the price would have to be raised until he was brought back into business. Of course, that is the general tendency. Occasionally some fellow is producing below the margin of profitable production.

Q. (By Mr. A. L. HARRIS.) As produce centers do Liverpool, New York, or Chicago fix the prices?—A. It is fixed in Liverpool, as far as that is concerned. It is the Liverpool price which makes up the cost of production, but in the long run that price must pay for the producing of the last increment of the supply.

Q. It is claimed that selling options misleads the merchant in Liverpool, and in that way makes rates or raises the price without relation to the amount of produce; is there any foundation for that?—A. It may be true temporarily, but the merchant in Liverpool who is liable to be misled does not survive. He goes out of business, and a more sophisticated merchant takes his place.

Q. Do supply and demand, after all, regulate it?—A. I believe that is so.

WASHINGTON, D. C., April 18, 1899.

TESTIMONY OF MR. E. E. CLARK,

Grand chief conductor, Order of Railway Conductors; and chairman of the executive committee of the Federation of American Railway Employees.

The commission met at 10.30 a. m., Mr. C. J. Harris presiding. Mr. E. E. Clark, of Cedar Rapids, Iowa, testified.

Q. (By Mr. KENNEDY.) Please state your name, place of residence, and your official relation with railroad organizations.—A. E. E. Clark, Cedar Rapids, Iowa, grand chief conductor, Order of Railway Conductors, and chairman of the executive committee of Federation of American Railway Employees.

Q. How large a per cent of railroad conductors of the United States and Canada are in your organization?—A. Our membership is at the present time about 22,700; I say about; it does not vary over 50 from that. We have probably 1,200 members in Canada and 300 or 350 in Mexico. The Interstate Commerce Commission

report, in good times, on our railways about 24,000 conductors employed in the United States.

Q. Your association having answered the topical plan of inquiry on transportation pretty fully, I would suggest that you take it up and see if there is any special topic in it that you would care to speak about now.—A. I will simply say that when this topical plan of inquiry was sent to us we arranged to answer it concisely, and, as we thought, comprehensively, in a written communication, which we filed with the commission, and naturally we incorporated in that what we thought was important, and what we specially cared to state, and I am here to-day in answer to the urgent invitation of the secretary of the commission. I do not think that I could with any advantage, either to ourselves or to the commission, take this plan up, because it would be a repetition of what we have already said. I am here at the invitation of the commission to answer any questions the commission cares to ask.

Q. (By Mr. C. J. HARRIS.) What are the usual hours of conductors?—A. It is a very difficult thing to state what the usual hours are. The average number of hours on duty for conductors at the present time are considerably shorter than they were a few years ago, brought about by the demand for more and more rapid transit of freight. Freight trains run cars daily faster than they did, consequently the number of hours on duty is shortened. Again, as influencing the situation, the general disposition of railroad companies is to lengthen the distance of the run, and where this has been done the number of hours are approximately the same.

Q. Are you paid by the length of the run?—A. The general basis of pay is by the mile.

Q. Is there any serious complaint in regard to the hours of work of railway conductors at the present time?—A. No; there is no serious complaint at the present time, and I might say no complaint at any time unless in the time of great rush of business, where business is so heavy that it necessitates keeping motive power and cars moving all the time, and naturally railroad companies in times of that kind desire to put on as few new men as possible, because the more new men put on they feel the more possibility of accident; they rather depend on the old men, and sometimes there is a disposition to keep them going too long.

Q. If you make extra runs you make extra pay in those busy seasons?—A. Yes; and I may say it is conceded by the managements of the roads that they do not want men to work beyond their physical ability, and it is the general rule that our agreements with companies provide that after a man has been on duty 16 hours he may demand 8 hours rest; that does not mean if he is delayed by accident; nor can a man demand rest in the middle of a division.

Q. (By Mr. KENNEDY.) I understand that some of the railroads of the United States are adopting a policy of refusing employment to men who have passed the age of 30 years, no matter how much experience they have had in the railroad business. Can you give the commission any information on that subject?—A. There seems to be growing up at the present time a general disposition among railroads to establish certain rules limiting the employment of men. Some companies provide that they will not hire a man as brakeman or fireman who is past a certain age. Some of them put it as low as 28, and some roads have a limit as high as 40 years of age. They direct their subordinate officials who have the employment of men to refuse employment to men who are past this age, and of course the subordinates have no choice but to carry it out.

Q. (By Mr. C. J. HARRIS.) What is the reason of that?—A. The only reason I ever heard assigned by railway officials was that they had a large number of men growing old in their service, and that there was a moral obligation, I think, to take care of those men by furnishing some sort of employment for those who had grown too old to follow in the capacity they were employed. If they hired a man of 20 years of age and had no bad luck they might expect to get 30 years of service out of him by the time he was 50, where, if 40, only 10 years of service would be gotten out of him. There may be room for suspicions as to other influences that are at work in that direction. I do not know that we would be justified in expressing any suspicions. We simply know that is a fact, and we think it is an unfair decision.

Q. (By Representative GARDNER.) If you had to express a suspicion, what would you say?—A. I would say one reason is that it has the effect of overstocking the market with experienced men. There is no use trying to dodge the fact that labor is governed more or less by the law of supply and demand. It may be it is looked upon as an influence calculated to make men extremely careful about losing a position.

Q. (By Mr. RATCHFORD.) Do the brotherhoods agree to the dismissal of their members because of old age?—A. Certainly not. If they undertook to dismiss our members because they got to be 40 years of age we would take care of that. It is where they are dismissed for something else, or out of a position, perhaps resigned a position 2 or 3 years ago; when they try to go back to work on the railroads they will not hire them.

Q. Where railroad companies dismiss any of their employees on the supposed ground that they are becoming aged, is that cause ever assigned by the companies for such dismissal?—A. No; I do not know of any instance where this cause has been assigned for dismissal. It is occasionally assigned as a cause for placing a man in some other employment. I want to carry that a little bit further. While appreciating fully the difficulties that would stand in the way of the enactment of any law, or the effort to enforce any law, requiring a corporation or any individual to give employment to any person they do not want, it does seem to me that if the railroad companies collectively, by understanding, if no direct understanding can be shown, adopt this policy, in the first place it is going to force the organizations to a more rigorous, and, if I may use the term, arbitrary, position in regard to dismissal of members for other causes, and, if there be any such thing as collective moral obligation, and I think there is, I believe if railroad companies are going to say railroad employees who have passed the age of 40 shall not be given employment again in that capacity, that some responsibility for the subsistence and maintenance of the men who have worn themselves out in the service should attach to the railroads or public, or the railroads and public jointly, because men have worn themselves out in the service.

Q. (By Representative GARDNER.) Suppose it was settled that a railroad man applying for a position after a given age, 30 years, would not be given employment, would not that operate to prevent young men from going into the railroad service?—A. It must operate as a preventive of the best quality of young men going into the service. They probably will have a sufficiency to fill vacancies, but they will not get the same class of ability that they get now; can not, because young men would have nothing to look to in the future.

Q. (By Mr. KENNEDY.) I understand that some railroads discharge men from their employment or refuse employment to men who have received some slight injuries; for instance, the loss of a finger, which does not incapacitate them from work, but the company alleges that it does, and treat them as if they had received a total disability. Can you say anything about that?—A. Railroad companies are generally adopting much more rigid physical examination of applicants for employment, and it is a fact that some of them refuse employment to a man simply because of the loss of a finger or thumb or something of that kind.

Q. (By Mr. FARQUHAR.) Do you mean by that, employment in the same class in which he received his injury, or employment as watchman or in some other position on the railroad?—A. I refer simply to a man who is out of employment altogether. The loss of a finger does not prevent a man satisfactorily and efficiently performing the duties he performed before that finger was taken off. Some of the most efficient trainmen and conductors are men who have lost one or more fingers from one or both hands. It does not operate to prevent him performing his duties; but if he has been unfortunate enough to lose a position on one road, and goes to another road for employment, they refuse him employment because of that physical disability—the amputation of a finger. Now, naturally, with the adoption of automatic couplers, the percentage of the men who will be minus one or two fingers will be smaller than in years gone by.

Q. (By Representative GARDNER.) What could be the reason for refusing employment because a man lost a finger?—A. I think it is carrying to an absurd extremity the ideas that have been advanced by some of the railroad companies' surgeons. They claim to know of instances where men have secured employment, and later, as a result of some slight or possibly imaginary accident, have established a claim against the company for damages on account of physical injuries received, and that after the collection of those damages the same man has gone to some remote part of the country and secured employment from some other railroad company, and done the same thing there.

Q. (By Mr. C. J. HARRIS.) For the same accident there?—A. For the same disability.

Q. (By Representative GARDNER.) Can that be true in the case of lost finger?—A. No; they adopt a plan of physical examination. The lost finger is something on its face and can be recorded and shown when men enter their employ. These minor injuries, such as the loss of a finger, have never been considered serious things by train men. If a man had that misfortune and the company paid his

report, in good times, on our railways about 24,000 conductors employed in the United States.

Q. Your association having answered the topical plan of inquiry on transportation pretty fully, I would suggest that you take it up and see if there is any special topic in it that you would care to speak about now.—A. I will simply say that when this topical plan of inquiry was sent to us we arranged to answer it concisely, and, as we thought, comprehensively, in a written communication, which we filed with the commission, and naturally we incorporated in that what we thought was important, and what we specially cared to state, and I am here to-day in answer to the urgent invitation of the secretary of the commission. I do not think that I could with any advantage, either to ourselves or to the commission, take this plan up, because it would be a repetition of what we have already said. I am here at the invitation of the commission to answer any questions the commission cares to ask.

Q. (By Mr. C. J. HARRIS.) What are the usual hours of conductors?—A. It is a very difficult thing to state what the usual hours are. The average number of hours on duty for conductors at the present time are considerably shorter than they were a few years ago, brought about by the demand for more and more rapid transit of freight. Freight trains run cars daily faster than they did, consequently the number of hours on duty is shortened. Again, as influencing the situation, the general disposition of railroad companies is to lengthen the distance of the run, and where this has been done the number of hours are approximately the same.

Q. Are you paid by the length of the run?—A. The general basis of pay is by the mile.

Q. Is there any serious complaint in regard to the hours of work of railway conductors at the present time?—A. No; there is no serious complaint at the present time, and I might say no complaint at any time unless in the time of great rush of business, where business is so heavy that it necessitates keeping motive power and cars moving all the time, and naturally railroad companies in times of that kind desire to put on as few new men as possible, because the more new men put on they feel the more possibility of accident; they rather depend on the old men, and sometimes there is a disposition to keep them going too long.

Q. If you make extra runs you make extra pay in those busy seasons?—A. Yes; and I may say it is conceded by the managements of the roads that they do not want men to work beyond their physical ability, and it is the general rule that our agreements with companies provide that after a man has been on duty 16 hours he may demand 8 hours rest; that does not mean if he is delayed by accident; nor can a man demand rest in the middle of a division.

Q. (By Mr. KENNEDY.) I understand that some of the railroads of the United States are adopting a policy of refusing employment to men who have passed the age of 30 years, no matter how much experience they have had in the railroad business. Can you give the commission any information on that subject?—A. There seems to be growing up at the present time a general disposition among railroads to establish certain rules limiting the employment of men. Some companies provide that they will not hire a man as brakeman or fireman who is past a certain age. Some of them put it as low as 28, and some roads have a limit as high as 40 years of age. They direct their subordinate officials who have the employment of men to refuse employment to men who are past this age, and of course the subordinates have no choice but to carry it out.

Q. (By Mr. C. J. HARRIS.) What is the reason of that?—A. The only reason I ever heard assigned by railway officials was that they had a large number of men growing old in their service, and that there was a moral obligation, I think, to take care of those men by furnishing some sort of employment for those who had grown too old to follow in the capacity they were employed. If they hired a man of 20 years of age and had no bad luck they might expect to get 30 years of service out of him by the time he was 50, where, if 40, only 10 years of service would be gotten out of him. There may be room for suspicions as to other influences that are at work in that direction. I do not know that we would be justified in expressing any suspicions. We simply know that is a fact, and we think it is an unfair decision.

Q. (By Representative GARDNER.) If you had to express a suspicion, what would you say?—A. I would say one reason is that it has the effect of overstocking the market with experienced men. There is no use trying to dodge the fact that labor is governed more or less by the law of supply and demand. It may be it is looked upon as an influence calculated to make men extremely careful about losing a position.

Q. (By Mr. RATCHFORD.) Is there, or is there not, a pretty well-established custom among railroad officials providing for temporary suspension of employees for some wrong or supposed wrong they may have committed in their work?—A. That used to be practically universal, but I think we may safely say now that on the majority of the roads—that is, a majority of the mileage of the country—that is called the Brown system of discipline, or modification of it, is in force, which is punishment without suspension. They keep records of men—all sorts, the merit and demerit entries—in a book. Instead of suspending men from service with loss of pay, they enter up 10 days' suspension against him, and for some meritorious act they give him a credit mark, and 6 months good record will erase 10 days' suspension, the idea being to keep the record of the men in that way and prevent the loss of employment; and it also prevents the necessity of keeping so many men on the extra list to take the place of men temporarily suspended; and the employee who is guilty of a minor offense is reprimanded and is informed that an entry is made against his record, and he goes on with his work, and when they receive a certain number of demerit marks—reach a certain maximum—or when the record is such as to justify dismissal, dismissal follows.

Q. Will you briefly outline the old plan of suspension?—A. The old plan of suspension was, when a man was guilty of a minor offense or oversight, they simply suspended him from duty; he lost his pay for 10, 20, 30, 40, 50, or 60 days.

Q. Have you ever known of a case in which a man was punished who was not guilty?—A. Oh, yes; a great many of them.

Q. Do you regard the change from that system to the present system as being an advantage to members of your brotherhood?—A. I regard it so; yes. It is so generally accepted by our brotherhood.

Q. (By Mr. KENNEDY.) What can you say as to betterment that has resulted from your organization; something of the condition of conductors before you had an organization and since?—A. Since our organization really assumed the position of a labor organization, and took up questions of relations of members with their employers, which commenced in 1890, the wages of conductors on practically all of the railroad mileage west of the State of Pennsylvania, south of the Ohio River, and north of the St. Lawrence River, have been increased from 5 to 25 per cent; their hours of labor have been lessened, conditions of employment have been improved, they are paid for excess hours or overtime, as we term it, which they were not paid for before, and the positions are more stable; and in the State of Pennsylvania, and east of there, there has been a great deal done in that same direction, but not so much—not quite so general. The New England States have more stable conditions than the western roads, and arrangements have been such as to make it very pleasant for the employees. They make an effort to get a man home as much as possible, instead of giving him a long run away from home, keeping him away two, three, or four days. They make the runs short, so that they are home for everything except their dinner, and the rates of wages there are better in comparison with the amount of work required than in the territory west and south and in Canada.

Q. Has your organization promoted independence on the part of the men, and done away with obsequiousness of the employees toward the employer?—A. We think so. In saying that, I do not want to say the organization has had influence in making them insubordinate; at the same time they have never lost sight of duties.

Q. Have discharges for alleged causes been less frequent on railroads than prior to the time your organization became influential?—A. Yes; a marked difference.

Q. (By Mr. RATCHFORD.) Do you attribute that, or any part of that, to the higher qualifications and standard of organized men?—A. I think that has some effect. I think the men have reached a higher limit of excellence in the performance of their duties all around, and I think that the knowledge on the part of the railroad officials of the organization's purposes to afford the men every protection that can be afforded them, is calculated to make them much more careful in making decisions.

Q. (By Mr. KENNEDY.) What do you know to be the sentiment of organized labor engaged in transportation on the subject of immigration?—A. Ordinarily, I might say, with practical unanimity the members of the railroad brotherhoods are in favor of very close restriction of immigration. We believe that this is necessary to the best interests of the workingmen of this country. We do not feel directly the effects of immigration—that is, the class of men commonly called immigrants do not come over here to get employment in train and engine service on the railroads—but we recognize the different branches or classes of working people in the United States, as arranged in a sort of a circuit, through which any evil effects are bound to be felt all the way down; as, for instance (of course I do not

speaking authoritatively, from the standpoint of a coal miner, but I simply make this general statement), a few years ago the coal miners of the State of Pennsylvania were a great deal higher caliber of manhood than at the present day. Now you may take the coal miners or any other class of employees who are able to earn reasonable wages and maintain their families, and who try to live something like Americans ought to live, if you bring in foreigners who live and work cheaper, at wages that these men can not work at and live, you crowd them out. The only thing this man can do is to seek employment in the next (what, you may say) higher paid place. We can not see how the best paid classes of labor in the United States can help but feel an interest in and be affected by conditions that surround and control the very poorest paid classes.

Q. Has your organization ever taken official action on that question?—A. No; excepting to pronounce in a general way in favor of restriction of immigration.

Q. Have you any suggestions to make as to the nature of an immigration law that would be effective, in the interest of our people?—A. I have my own idea. The organization has never pronounced in favor of any particular line.

Q. What are your ideas about it?—A. I had to stay in this country 21 years before I could vote. I do not know why anyone else coming here should not do the same. I believe it is all right to admit, to a reasonable extent, immigrants who make good citizens, who cast their lot with this country, who attempt to stay here and raise their children here. I do not believe in admitting any who come here simply because conditions are better than in the old country, who live like so many swine and send all their money out of the country, as a great many do.

Q. Do you believe if this commission were to recommend to Congress legislation that would restrict immigration, that organized labor throughout the country would support such recommendations?—A. In my judgment it would.

Q. (By Mr. RATCHFORD.) What qualifications should be fixed; what standard is necessary?—A. I do not know that I could define in exact terms my idea of the standard that is necessary; but I can not lose sight of the fact that we have a Chinese exclusion act, and while we have a Chinese exclusion act we are admitting a whole lot more just as bad as Chinese. I would put them in a bunch and put them under the same act.

Q. (By Mr. KENNEDY.) The commission will at some time in the future, I think, consider some proposed bills in the interest of the railroad organizations, and I will read to you the title of them; they were submitted to the commission by Mr. Moseley, the secretary of the Interstate Commerce Commission. The first is a proposed bill to require railroads to make detailed reports to the Interstate Commission of every accident. Does your order favor such a bill as that; and what have you to say as to what should be embraced in such a bill?—A. I believe that the public should take a great deal of interest in the welfare of the railroad employee. We have no Government railroads in this country, and I can not say that I am in favor of Government ownership or control of our railroads to the extent of controlling the operation of them, but I believe employees are in a sense public servants. They serve the public and the public should have the widest possible information as to the conditions under which they work. I believe that the question of the injuries received by the railroad employees is a matter of general public interest. If we had not been able to show by absolutely reliable statistics the number of men who were killed and injured annually in the railroad service in the United States, we never would have secured the passage of the law providing for the use of automatic couplers and brakes. Now in view of the conditions that we have before referred to, and the effect that the minor injury received a few years ago sometimes has on a man to-day, I see no reason why it would not be consistent and of very great value to have all these injuries reported to the Interstate Commerce Commission for the purpose of preparing reliable statistics on that subject.

Q. How much of a report do they make in regard to accidents?—A. They simply report the number injured.

Q. Do they give the cause?—A. They give no details, except that in some cases the number injured coupling cars are kept by themselves; that is, they are gathered in an independent group. They say, "Injured by falling from moving train," but there is nothing said as to what caused the man to fall from the train or what other thing there was that caused him to be "injured while making a coupling."

Q. (By Mr. C. J. HARRIS.) What is the condition of safety appliances now?—A. As near as we can observe (I get it from reports recently promulgated by the Interstate Commerce Commission) they are shaping themselves very satisfactorily.

Q. Are there any suggestions you would make from your experience?—A. Nothing from a national standpoint. I think that the act we now have, under the extension that was granted by the Interstate Commerce Commission, and our

understanding that they will require strict compliance with those provisions, would do all that is necessary.

Q. Anything to complain of just now?—A. No. It will be necessary for some States to require the equipment of cars used only in State traffic.

Q. (By Mr. KENNEDY.) The next is a proposed bill to cover such a case as that known as the Baugh case, on the Baltimore and Ohio Railroad, to bring about harmony in State and Federal decisions.—A. The case referred to is one in which an injured employee brought suit against a railroad company in the State of Ohio. The case was removed to the Federal courts and the decision rendered by the Federal courts was almost diametrically opposed to the decision that would be expected under the State law or decision that would have been handed down by the State court, and the idea is that the decisions of the Federal courts in the State should conform to State laws.

Q. Your organization is in favor of such a bill as that?—A. Yes; we think that is only reasonable and fair.

Q. Another is a proposed employers' liability bill.—A. I think I have outlined our position on that in regard to minor disabilities and the age limit fixed by the railroad companies. I believe full liability should attach to the railroad company for injuries received while in their employ which are in any sense attributable to or the result of improper equipment, improper condition of roadbed or track, negligence, incompetency, or act of fellow employee; and I want to supplement in that regard what is said in our written answer, that a man has no choice as to whom he works with. If we take any given railroad, the Baltimore and Ohio, for instance, right out of Baltimore the trainmaster employs the trainmen. I, as a conductor, am going on that train; the trainmaster says who is to go with me as a brakeman; I have no choice whatever until I have tried that man and find him incompetent and inefficient; then I can object to keeping him any longer. A conductor has nothing to say about what engineer or fireman shall go out with him. The company has absolute control of these things, and inasmuch as the employee has no choice whom he will work with, that company should be responsible for the acts of its agents in assigning the men and the employment of the men.

Q. Another: Proposed bill to provide for blocking frogs in the District of Columbia, Territories, and on Government reservations. Are you familiar with that bill?—A. Yes; and I will be frank enough to admit that the matter of blocking frogs is not of as much importance as some think it to be, and especially at this time when the general increase in the number of cars that are equipped with automatic couplers obviates the necessity of men going between cars so much to couple and uncouple. Where men get caught in the guard rail or frog, in 9 cases out of 10 it is where they get in between cars to uncouple or to couple. The pin occasionally gets stuck in the link, and in trying to loosen it while the cars are moving a man walks along with the cars and unfortunately walks into the frog, falls down, and the cars go over him; and there have been a great many accidents of that kind. Now instead of going in there to pull that pin, with the cars equipped with modern couplings he stays at the outer edge and pulls it from the corner of the car. With the automatic coupler there is very little occasion to step in between the cars. If he does not have to step in between the rails he can not get stuck in the frog. The only danger after these things are completed will be that the men in running across the yard might possibly get stuck in them, but I think the chances are very remote.

Q. (By Mr. C. J. HARRIS.) Have there been any strikes of your organization in late years?—A. Not since 1893, I think it was.

Q. Are you able to settle by conciliation with the managers, as a general thing, your difficulties?—A. Yes.

Q. (By Mr. KENNEDY.) Have you anything further that you think important to talk about?—A. Only one thought that occurs to my mind; that extension of time, granted by the Interstate Commerce Commission, within which the railroads should comply with the safety-appliance act. It has been charged that the officers of these organizations agreed to that at the behest of the railroad companies, and that charge came from those who have no influence or any interest in railroad matters, and I do not think it would be made by any person who was present at the meeting or who would read the proceedings of the committee. These organizations seek in all things to be fair. We realized that some of the railroad companies had been absolutely unable to comply with the law within that time and keep out of the hands of receivers. A good many got in the hands of receivers without complying with it. We opposed any extension that would have the effect of nullifying the spirit of the law, and the fact that the request of the railroad companies for an extension of time for 5 years was cut down, through our opposition, to 2 years, I think, speaks for itself.

speaking authoritatively, from the standpoint of a coal miner, but I simply make this general statement), a few years ago the coal miners of the State of Pennsylvania were a great deal higher caliber of manhood than at the present day. Now you may take the coal miners or any other class of employees who are able to earn reasonable wages and maintain their families, and who try to live something like Americans ought to live, if you bring in foreigners who live and work cheaper, at wages that these men can not work at and live, you crowd them out. The only thing this man can do is to seek employment in the next (what, you may say) higher paid place. We can not see how the best paid classes of labor in the United States can help but feel an interest in and be affected by conditions that surround and control the very poorest paid classes.

Q. Has your organization ever taken official action on that question?—A. No; excepting to pronounce in a general way in favor of restriction of immigration.

Q. Have you any suggestions to make as to the nature of an immigration law that would be effective, in the interest of our people?—A. I have my own idea. The organization has never pronounced in favor of any particular line.

Q. What are your ideas about it?—A. I had to stay in this country 21 years before I could vote. I do not know why anyone else coming here should not do the same. I believe it is all right to admit, to a reasonable extent, immigrants who make good citizens, who cast their lot with this country, who attempt to stay here and raise their children here. I do not believe in admitting any who come here simply because conditions are better than in the old country, who live like so many swine and send all their money out of the country, as a great many do.

Q. Do you believe if this commission were to recommend to Congress legislation that would restrict immigration, that organized labor throughout the country would support such recommendations?—A. In my judgment it would.

Q. (By Mr. RATCHFORD.) What qualifications should be fixed; what standard is necessary?—A. I do not know that I could define in exact terms my idea of the standard that is necessary; but I can not lose sight of the fact that we have a Chinese exclusion act, and while we have a Chinese exclusion act we are admitting a whole lot more just as bad as Chinese. I would put them in a bunch and put them under the same act.

Q. (By Mr. KENNEDY.) The commission will at some time in the future, I think, consider some proposed bills in the interest of the railroad organizations, and I will read to you the title of them; they were submitted to the commission by Mr. Moseley, the secretary of the Interstate Commerce Commission. The first is a proposed bill to require railroads to make detailed reports to the Interstate Commission of every accident. Does your order favor such a bill as that; and what have you to say as to what should be embraced in such a bill?—A. I believe that the public should take a great deal of interest in the welfare of the railroad employee. We have no Government railroads in this country, and I can not say that I am in favor of Government ownership or control of our railroads to the extent of controlling the operation of them, but I believe employees are in a sense public servants. They serve the public and the public should have the widest possible information as to the conditions under which they work. I believe that the question of the injuries received by the railroad employees is a matter of general public interest. If we had not been able to show by absolutely reliable statistics the number of men who were killed and injured annually in the railroad service in the United States, we never would have secured the passage of the law providing for the use of automatic couplers and brakes. Now in view of the conditions that we have before referred to, and the effect that the minor injury received a few years ago sometimes has on a man to-day, I see no reason why it would not be consistent and of very great value to have all these injuries reported to the Interstate Commerce Commission for the purpose of preparing reliable statistics on that subject.

Q. How much of a report do they make in regard to accidents?—A. They simply report the number injured.

Q. Do they give the cause?—A. They give no details, except that in some cases the number injured coupling cars are kept by themselves; that is, they are gathered in an independent group. They say, "Injured by falling from moving train," but there is nothing said as to what caused the man to fall from the train or what other thing there was that caused him to be "injured while making a coupling."

Q. (By Mr. C. J. HARRIS.) What is the condition of safety appliances now?—A. As near as we can observe (I get it from reports recently promulgated by the Interstate Commerce Commission) they are shaping themselves very satisfactorily.

Q. Are there any suggestions you would make from your experience?—A. Nothing from a national standpoint. I think that the act we now have, under the extension that was granted by the Interstate Commerce Commission, and our

was employed, to obtain a slight increase of pay. At that time the wages of locomotive engineers throughout the country was \$60 a month, firemen \$30, freight brakemen \$25, freight conductors \$40, passenger conductors \$60. Those were the almost uniform rates of pay for that class of service up to the formation of the brotherhood. After that we appointed committees on the roads where our brotherhood was established. They were known as general boards of adjustment, whose duties were, if any difference came up between the company and the men, to investigate and ascertain the facts. If they found upon investigation that the grievances were just, they waited upon the officers of the road. If they went to effect a settlement with the general manager of the road, and they were not satisfied and wanted the protection of the organization, they were required to send for the chief executive. It was his duty on receipt of the communication from the committee to proceed at once to the road and seek a conference with the general manager, and president if necessary, and use all honorable means to effect a peaceable and amicable adjustment of the differences that he found existing between the men and the company. In nearly every case, with few exceptions during my administration of 25 years, we succeeded in effecting an amicable adjustment, establishing what we call written agreements between the company and the men; so that to-day we have written agreements embodying the rate of pay, the rules for the government and protection of the men, with 90 per cent of the roads in the country. We have succeeded, through the efforts of our organization, in increasing the wages of locomotive engineers from \$60 per month to 3½ cents in passenger service, and 4 cents in freight, per mile run. The firemen, through their organization, increased their wages in proportion.

Q. Please state what constitutes a run, so that we may have a basis for comparison.—A. A hundred miles or less constitutes a day's work, 3½ cents in passenger service and 4 cents in freight, through, I might say, the Middle and Western States. In the Southern States the rate is 3 and 4 for the same class of service. There has always been a difference between the South and the North in that respect. One hundred miles or less constitutes a day's work; 10 hours or less constitutes a day's work. In 1867 we established an insurance department. It is conducted on the assessment plan; it was patterned after the metropolitan police force of the city of New York at that time. Through that department we have paid to the widows and orphans nearly \$8,000,000. We issue four policies; we may take one of the four, \$750, \$1,500, \$3,000, and \$4,500 is the limit. A large number of our subdivisions also have what they call weekly beneficial assessments which pay \$10 and \$12 a week in case of sickness or injury. It is a rare thing now to find a locomotive engineer, a member of our brotherhood, who indulges in anything intoxicating. The laws of the organization prohibiting it are very strict. In order to become a member of our brotherhood a man must be a man of good moral character, temperate habits, able to read and write, and have had 1 year's experience as a locomotive engineer. He fills out an application, which is referred to an investigating committee which investigates into the character and standing of the applicant, and upon their recommendation he is admitted. I have no doubt it will surprise the commission, but, as I have often said it from the public platform, I do so to convince the people that we are endeavoring to carry out the objects for which the brotherhood was formed—in 1 year we expelled from our organization for intoxication 172 members. That was about the fifth year of the existence of our organization. Our laws are very rigid in that respect. It becomes the duty of the division, when they expel a member for intoxication, to notify the company, so if they retain him in their service they do it on their own responsibility; but I have known the company to do it after they were notified. Some have in many instances cooperated with us in ridding the service of that class of men. Others have not paid any attention to it. We did not receive for many years the assistance and cooperation of the railroad companies that we were entitled to in that direction, but of late years we have. I think that we have convinced them by our work that we are sincere and honest in our efforts to give to the railway companies a more reliable, trustworthy class of men. We have done that. We have always claimed that we were in a position to judge better than any officer of the company, and to detect the men in wrongdoing, because we are mingling together day and night, while the officers are at home or asleep. In that way we have been very successful in ridding the service of that class of men. We have always aimed, as an organization, to do what was right and just between the companies and the men. Our policy in dealing with these questions has been to bring the parties together, and sit down and talk the matter over and reason together, and wherever the circumstances would warrant concessions being made upon either side we have always been willing to make them. We believe in that line of policy being pursued in the adjustment of grievances and

differences, as they will spring up between the employer and employee. Men employed in railway service differ very much from men engaged in other pursuits, from the fact that they are subject to so many different masters. You may commence with the roundhouse foreman, if you please; then comes your yard master, your train dispatcher, your master mechanic, the division superintendent, general manager, etc.; he is subject to them all. It has occurred very frequently where men occupying positions like roundhouse foremen in a little heat have dismissed or suspended men from the service without just cause. That is what really caused the brotherhood to establish these general committees. We believe in protecting the men in everything that is right and just. We have never dictated to a railroad whom they shall or shall not employ. We have asked the railroad companies to give the oldest men in the service, if competent and worthy, a preference of engines and runs. We have succeeded in many places in having that embodied in our written agreements, but we have never resorted to coercive measures to bring it about. We have never attempted to interfere in any way with the railroad company employing men, whether they belonged to our organization or not.

Q. Do they employ many who do not belong to your organization?—A. Oh, yes; quite a number. The majority of engineers of this country, as well as of Canada—of course we include the entire continent—90 per cent of them are promoted from firemen, and it is optional with a man whether he becomes a member of our organization or not. We offer no incentive; we place no obstacles in his way. If our record as an organization is not sufficient to convince him that it is to his interest to be a member thereof he remains out.

Q. (By Mr. KENNEDY.) What is the total number, approximately, of engineers in the country, and how many are in your organization?—A. I think I would be safe in saying that we have 90 per cent of the locomotive engineers of the country in our organization. I should say perhaps there are between 35,000 and 36,000 in the United States and Canada.

Q. (By Mr. FARQUHAR.) Was there an organization of locomotive engineers under the so-called Knights of Labor?—A. No.

Q. Yours, then, is the only organization of the locomotive engineers in America?—A. Yes.

Q. (By Mr. KENNEDY.) Are the Mexican engineers in your organization?—A. There is only one native locomotive engineer who is not a member of our brotherhood. In our constitution we have the color line. A man can not belong to the brotherhood unless he is a white man.

Q. (By Mr. FARQUHAR.) In case of a man being dropped from your organization for intemperance and for satisfactory reasons to your organization, is he, by that one dereliction of duty, shut out from your organization and from employment on another road?—A. He is expelled from the organization, but we do not as an organization interfere with his getting employment elsewhere, if anyone wants to employ him.

Q. (By Mr. PHILLIPS.) What is your reason for excluding colored men from the brotherhood, and are colored engineers employed on the railroads in the South?—A. None that I know of. The only reason that I can assign is this, that in 1873 a delegate from San Francisco brought the question before the convention, as they had a colored man running between Truckee and Wadsworth, on some division of the Southern Pacific road. The question up to that time had not been raised, and he brought it up before the convention, which resulted in a resolution being passed at that convention prohibiting colored men from joining the organization.

Q. (By Representative LIVINGSTON.) Why?—A. I can not assign any reason for it, simply the judgment of the delegates.

Q. What was the reason given by the delegates at the time of passing that resolution?—A. None, whatever, that I know of. A delegate is not required in a convention to give his reason; he exercises his prerogative and uses the ballot. A great many things were said, but no particular reason assigned. We did not want them.

Q. Can you not assign the reason why you do not want them now?—A. Yes; the reason that I would give is, we do not want them. They will not have them in the Southern States. Our organization is well represented in the Southern States, and certainly it would not be right for me, as executive officer, to go contrary to the wishes of the membership in the South.

Q. Would they receive them in Pennsylvania and New York?—A. No.

Q. Then will you not say it covers the whole territory?—A. We do not recognize any particular territory.

Q. (By Mr. KENNEDY.) Would a railroad receive them anywhere in the country?—A. The railroad engineers would not.

Q. Have the companies colored engineers in Pennsylvania?—A. They have not any.

Q. Do corporations and people whose employees have places where life and property are at stake every moment exclude ignorant, careless, and indifferent people, whether they are black or white, and seek to get intelligent, trustworthy, and competent agents?—A. Yes; and we seek, as an organization, to furnish them with that class.

Q. You say you have those written agreements with about 90 per cent of the railroads of the country. Have the men in your organization ever violated those agreements?—A. Yes, some of them have.

Q. Have the railroads ever violated them?—A. Not before the men did. I am sorry to say that a good many of our men became involved in that trouble of 1894, and by doing so they violated the agreement they had with the company and violated the laws of the organization, for which they were punished.

Q. Is there any age limit fixed by the railroad companies beyond which they will not employ men as engineers?—A. I could not give you anything officially. I could only give you that from hearsay, from complaints made to me by some of my men, in which they say that some of the companies refuse to employ a man if he is over 45 years of age. There has been, in the last few years, introduced on a number of roads what they call a personal examination with regard to vision and hearing, and quite a number of old experienced men have been taken off the road for defective vision and defective hearing. And, according to the statements made to me, I have said, and I wish to repeat it here, that the examinations that our men have been required to undergo, if the statements made to me are true, were unfair and unjust; and we have succeeded in having them somewhat modified. We admit that a man requires good vision and good hearing; but when you take a man into a dark room and require him to name the different colored worsteds and detect the tick of a watch so many feet away and so on, I consider that unnecessary, uncalled for, and unfair. If a man has good eyesight and can distinguish the different-colored signals used by a railroad day and night, and has run a locomotive 35 or 40 years, I never could understand why he should undergo such an examination to make him qualified to run.

Q. (By Mr. FARQUHAR.) Would a man who has been in continuous service with a road for 25 or 30 years be allowed to pass the 45-year limit as long as he remained an efficient engineer, or would he be retired at 45 years?—A. I have never known of any such cases yet. We had 1 man running on the Baltimore and Ohio road here who ran up until he was 80 years of age; and he ran the fast line between Washington and Baltimore, and was then retired on a pension. We have men still running locomotives, who are all the way from 45 and 50 to 60 years of age. I ran a locomotive myself for 20 years, and I have been off for 25. A good deal depends upon the man and the care he has taken of himself.

Q. (By Mr. KENNEDY.) Will you tell the commission your experience with injunctions and the manner of their service upon you?—A. Yes; my experience has not been very pleasant with some of the injunctions that have been issued and the decisions rendered by some of our judges. Take, for instance, the case on the Northern Pacific road. There never was a more unjust act perpetrated on men than there was on that occasion. Each one of us in the office was served in Cleveland. Men who never go out of the office, whose duties never take them out of the office to do any business with the companies, were served with injunctions granted by Judge Jenkins, of Milwaukee, which prohibited me and every other man from talking, conferring, counseling, or advising with our men. I think that was very unfair and unjust. In the first place, the road was in the hands of receivers. The receivers, without consulting with the men, got up a new schedule of wages, which was a reduction from what the men were receiving. There may have been some talk among the men; there was a good deal of dissatisfaction; but they could have no strike on that road or any other road without first calling upon the executive officers of the organization and having a meeting with the management. So that this talk and the reason assigned for getting out these injunctions was all uncalled for; there was nothing to it. Finally we met the receivers and talked the matter over with them and arrived at an amicable adjustment for the time being, but the injunction was there all the same; and I remember Judge Jenkins, in his ruling, made use of this expression, "The men have a right to quit work individually or collectively if they want to, but they have no right to quit work if it cripples the business of the road. Whoever heard of a body of men quitting that it did not affect or cripple the business, whatever they were engaged in? Then Judge Taft, or, rather, Judge Ricks, issued an injunction in the case of the Toledo, Ann Arbor and North Michigan road, which amounted to the same thing, prohibiting advising and counseling

with the men, which I think was very unjust. I think there ought to be something done to strip some of these judges of a little of their authority when it is exercised in the wrong direction.

Q. Has such use of the injunction had a tendency to lower respect for the courts among your membership?—A. Most decidedly.

Q. (By Mr. FARQUHAR.) Was it on the application of the railroad managers that these injunctions were issued?—A. It was on the application of the receivers in the case of the Northern Pacific; there were no managers; but in the case of the others it was on the request of the officials of the road.

Q. Were those injunctions called out by public opinion at any time, in your recollection?—A. Not that I am aware of.

Q. Or by any newspaper discussion?—A. No; they were issued at the request of the company. Take the case of the Toledo and Ann Arbor road. We exercised every honorable effort with Mr. Ashley; we even offered to work for him for a less rate of pay than any other road was paying. He positively refused. Consequently the men decided to quit, and we sustained them in quitting and gave them the protection of our brotherhood. We did what we thought we had a right to do, but since the decision of the Supreme Court we learn that we did not have the right. We had in our organization a rule that prohibited our men from handling cars of a company where there was a strike—a legal strike—in force. Consequently, when we decided to quit on that road we notified the chairmen of the committees of the adjoining roads that there was a legal strike in force upon the Toledo, Ann Arbor and North Michigan road, and to notify the general managers of that fact, which they did. Of course, our men, understanding the laws of the brotherhood, refused to handle Ann Arbor cars. Then the injunction was issued to put a stop to it, and our men were arrested. We appealed it to the circuit court and the circuit court sustained the lower court, and we brought it to the Supreme Court at Washington and they sustained it. Consequently we have eliminated the rule.

Q. Was the basis of the decision there on the interstate-commerce clause?—A. Yes; and the antitrust law, I think.

Q. Was the reason assigned by Mr. Ashley, when he asked for a reduction of wages on the Toledo and Ann Arbor road there, that the finances of the road compelled him to do that?—A. No; I am sorry to say young Mr. Ashley did not assign any reason. One year before we had a dispute with his father, the ex-governor, which was submitted to arbitration, and the arbitrators made an award and young Mr. Ashley never carried it out, and that feeling of discontent and dissatisfaction continued to exist which culminated in the strike. Mr. Ashley did not advance any argument except "I won't; I won't."

Q. Previous to this injunction did you have a written contract with Mr. Ashley and the road?—A. Yes.

Q. And the infraction of that contract was through Ashley and the company?—A. Yes.

Q. In a case of that kind is it common, when you make application for the dissolution of an injunction, to bring forward this written instrument of agreement and to show that you are holding to the terms of your agreement?—A. When the papers were served upon me I was sitting in the depot at Toledo. I read them over and I said to the United States marshal, "I will obey the order of the court." I immediately returned home and consulted my attorney, and he told me what to do and I did it. At the hearing before Judges Taft and Ricks all that was brought out, and it had no weight upon the decision rendered by the court.

Q. Did the court take into consideration the written instrument of agreement between the men and the road?—A. No; Judge Taft went so far as to say in his ruling that I was a conspirator.

Q. Independent of the writing or agreement?—A. Yes; independent of anything that was produced in court.

Q. (By Mr. PHILLIPS.) Was the written agreement produced in court?—A. I was under oath. It was not called for. The statement under oath called for it and was given by me.

Q. (By Mr. KENNEDY.) Would you have any objection to telling the commission something about the nature of the different funds which your organization has been building up?—A. Not the least. We have, you might say, three separate funds. One is the current fund, drawn from to pay the general expenses, salaries, printing, and so on; another is known as the charity fund, the widow and orphans' fund, if you please; the other is known as the contingent fund, to be drawn from in case of emergency, or, in other words, in case of a strike. You know we have had strikes; we are not ashamed of them, and we make provision for all those things. Our current fund is drawn from at each convention. We have, in the

first place, what we call a charity blank, which is filled out by persons who need assistance and signed by the officers of the division. They are brought to the convention; they are submitted to our executive committee, who investigate and recommend an allowance. The convention in the first place sets apart so much to be given away to charity. Last year they gave away \$42,000. That is about the average which they give in that direction. Of course, that reduces the current fund somewhat. We have had no occasion to draw from the contingent fund for a number of years, so it is growing.

Q. Would you care to state the size of it?—A. It is in the neighborhood of, perhaps, \$100,000. I could not state the exact figures without looking it up, because I am not the financial officer and do not pay as much attention to the details in that direction as he does.

Q. What is the assessment upon your members for these different funds?—A. What is known as the grand dues is \$2.50 a year, for which they receive a copy of our monthly journal. Then the local dues paid to the local divisions average from \$4 to \$6 a year. So that you may say that the total dues for membership would be from \$8 to \$9 a year.

Q. Are these different funds of your grand organization built up from this \$2.50 or are they partly built up from the \$4 to \$6 paid into the locals?—A. No; they are built from the \$2.50 and the profits on printing. We furnish all the printing of different documents of the subdivisions, on which there is a profit, and that goes into the general fund. For instance, from the publishing of our monthly journal there is quite a revenue derived, and quite a revenue from our constitutions and by-laws and all other documents required by the subdivisions, and all that goes into the current fund, out of which they contribute \$42,000 at each convention.

Q. Is this fund of \$100,000 practically the same as the defense fund among the conductors?—A. Yes; simply that we call it the contingent fund instead of the defense fund.

Q. (By Mr. FARQUHAR.) Is your insurance regarded among your brotherhood as less onerous than the usual rates of fraternal insurance?—A. I can say this: The rate has never yet exceeded $1\frac{1}{2}$ per cent. Some years the rate of mortality is higher than others—and the number of accidents; but the rate has never yet exceeded, to my knowledge, since its formation in 1867, $1\frac{1}{2}$ per cent. We think it is one of the best. It is better than we can get in any old-line company from the fact that we pay for the loss of a hand, arm, limb, or eyesight of one or both eyes, the same amount as we do for death.

Q. Is it the desire of your brotherhood to maintain among yourselves this insurance solely, or to agree to the cooperation of the companies in furnishing a part of the insurance?—A. Our men, speaking of them as a whole, prefer their own. It is only of recent date that the railroad companies have taken any steps to make provision for their men. I remember when it was first introduced in the Pennsylvania system. It created a great deal of dissatisfaction, so much so that I was called to the city of Philadelphia. They were all worked up, excited; did not want it; would not have it. We took the matter up with the committee and we looked it over, and I said, "If you can get the company to eliminate this obligatory clause there are no objections to it." I advised them to go and wait upon Mr. Pugh, or the president if necessary, and ask him to eliminate that obligatory clause. They did so, which was satisfactory. I said, "As long as this matter is left optional for you to take or leave it alone, you have no right to find any fault." The company did eliminate the obligatory clause and left it optional with the men, and it was not but a little while before they all went into it.

Q. Then the striking out of this clause has made it voluntary on the part of the men?—A. Yes.

Q. And is it still satisfactory in existence?—A. As far as the Pennsylvania system is concerned, I have heard no complaints, and I have heard of many who have gone into it.

Q. Would the firemen acquire a larger sum of insurance by taking the cooperation of the railroads?—A. No; I think not.

Q. Would they pass your limit of 4,500?—A. Oh, no; that is the limit with us.

Q. (By Mr. KENNEDY.) Is there no feeling among the engineers that the railroad companies promote these beneficiary societies for the purpose of dividing the allegiance of the engineers between their organization and their interest in the fund controlled by the company, so that in time of trouble they would hesitate what to do?—A. There have been such expressions made by individuals, but I can not say that it is a general feeling. There have been quite a number of complaints made about the way it is managed on the Baltimore and Ohio system, but as I have said, I have heard no complaints from the Pennsylvania system. You

talk with some of our men and you will find that quite a number have a feeling of distrust concerning it; they think it is done, you may say, to wean the men away from their own or win them over. I have said this, that we, as an organization, long before the railroad companies took any interest in that direction, made provision for the men, and we think we are entitled to the preference.

Q. (By Mr. FARQUHAR.) And you think that provision is ample?—A. Oh, of course, that has kept out of our insurance a great number who would have gone into it had it not been for that.

Q. Will you tell the commission something about the relations your organization bears toward the other organizations in railroad transportation?—A. Our relations are friendly, although we are not a part of the federation. We believe in cooperation, and we have, in every instance where a wish has been expressed by our men and the others, cheerfully cooperated with them in the adjustment of grievances, and we will continue to do so. The question of the Brotherhood of Locomotive Engineers joining the federation was submitted to our last convention. It was thoroughly discussed and defeated. Prior to that they had system federations, which left it to the men on the system to determine whether they would have it or not. It was adopted on quite a number of systems, and the other organizations at their conventions delegated authority to their executive officers to formulate a plan and submit it to the membership of their organizations, which they did, and it was adopted. It is known as the national federation, which abolished system federation. Consequently we are outside of the federation, yet our relations are friendly—I can speak personally for myself—with the other executive officers; they are of the most friendly character, and, so far as I am concerned and the organization I represent is concerned, nothing will be done to disturb those relations if we can possibly avoid it. We believe in being on friendly terms with everybody; but when the delegates, who are the lawmaking body of our brotherhood, pass upon the question and decide it, that settles it for the time being.

Q. In other words, you mean that you hold to the autonomy of your own organization and cooperate in a friendly way with like organizations in transportation?—A. Yes; that is our position exactly.

Q. (By Mr. KENNEDY.) What is the principal reason why you do not go into the federation with the other trades?—A. I will answer your question just the same as I told Brothers Clark, Morrissey, Sargeant, and Powell in the city of Washington some time ago. They asked me my reasons for opposing federation. I said, "I am not willing to delegate the power and authority to a conductor, a telegraph operator, a fireman, or a brakeman to say whether the engineers shall quit work or not. I want that question to be decided by engineers, not by anybody else." That is one of my principal reasons. Another reason is, the moment you federate you lose your identity as an organization. No matter how you may do it, the public will look upon it that you have become a part of the federation, and you will be known then as the American Federation of Railway Employees only; there will be no Brotherhood of Locomotive Engineers, or Brotherhood of Locomotive Firemen, or Order of Railway Conductors, or Order of Railway Telegraphers. I may be mistaken. We are the pioneers in the work of reformation among railway men. For years we were the only organization that claimed to be a protective organization. For 23 years the Order of Railway Conductors was known as a nonprotective organization; the same way with the Brotherhood of Locomotive Firemen up to 1885; and for 30 years we went right along adjusting our grievances, making agreements with the companies without the aid or assistance of anybody. We have treated everybody well so far as we knew how, and I never could understand, and I do not know to-day, why it is necessary for the locomotive engineers to federate with others. For what purpose? Might never made right. Some, however, advance this argument: If a delegation representing every branch of the service walks into the office of the general manager he would not dare say no. Well, that remains to be seen. I do not believe that we ought to win by resorting to coercive measures, nor do I believe you would be received in the same spirit if you would approach him in that coercive way. Again, it may be selfish, but federation would mean that each organization would have to spend its time and money in adjusting other people's differences. Personally I have always been opposed to it, and there has never been any argument advanced by anyone to convince me that it was necessary for the Brotherhood of Locomotive Engineers to federate with the organizations for its future good.

Q. You have taken lessons then from the causes which have brought about the downfall of the Knights of Labor?—A. Of course I have had my own notion and my own view about these things. I differ with a great many men as to how a labor organization ought to be conducted. I have gone on the principle that we

should all be willing to do by other people as we would like to have them do by us; that is my way of doing business, and I wish to say here, for the information of the commission, that if the railway managers of this country had received us as we have always been willing to meet them, so far the Brotherhood of Locomotive Engineers is concerned, we never would have had any trouble; there never would have been any strikes.

Q. (By Representative LIVINGSTON.) I believe they say the same thing of you—if you would have done what was right they would have. How do you harmonize those two statements?—A. Let us take the facts. You are the general manager, if you please, of a road whose stock is quoted at 145 or 150, recognized as one of the leading and richest corporations in the West. Your men approach you and want you to pay as much as your competitors. You say, "I won't do it." We try to convince you of the fairness of our proposition. You still refuse; you are stubborn; you will not do it; the men decide to quit. Who is to blame?

Q. Has your organization lessened the number of wrecks, loss of property, loss of lives, and things like that, and by that means improved the situation all along the line?—A. We have assisted the companies in ridding the service of a great many incompetent men.

Q. Does not that help the service?—A. Yes.

Q. Have you lessened the loss of life and property by your organization to a very large per cent?—A. We have, I think.

Q. (By Mr. KENNEDY.) I have here a magazine article, which seems to show pretty conclusively that the practice of blacklisting has been carried on quite extensively in some parts of the country, especially in that great railroad center Chicago? Do you know anything about that question?—A. No.

Q. It is published in the Arena, and the author of it is Mr. William J. Strong, the attorney who won that suit for Fred R. Ketcham, one of the strikers who was blacklisted in the strike of 1894, and the jury gave him a verdict of twenty-one thousand and odd dollars.—A. I could not say from personal knowledge, you understand, that any company had blacklisted the engineers. I have heard that such things have been done. Statements have been made by some of my men in which they say like this: "I have been discharged for belonging to the brotherhood; have applied for employment on another road; I was given employment, went to work, and in a few days I was notified that my services were no longer required." They attributed it to some notice the road had received from the last road where they were employed, but I could not state positively that a man was blacklisted. You of course remember the trouble of 1894. Quite a number of our men became involved in that trouble. It occurred on a certain day in June. Those men who voluntarily quit, asked for letters from their former employers. They were given letters in which it stated the date they quit.

Q. (By Mr. FARQUHAR.) And the date corresponded?—A. With the date of the strike, and consequently when they sought employment and produced this letter; that seemed to shut them out. Of course I have read of cases. I think I read of the case you speak of, where men have recovered, and I think they ought to. I do not think you have any right to place any obstacles in the way of any man obtaining employment to earn a livelihood for himself and his family, because if he does not suit you he may suit someone else. It is all wrong and ought not to be allowed.

Q. (By Mr. KENNEDY.) Was it ever alleged that there was a blacklisting feature connected with the trouble on the Reading road some years ago when it was in the hands of receivers?—A. No. I will give you the history of the Reading road. Of course Mr. Gowan is dead and gone. During the Centennial of 1876 the Reading road carried a great many passengers, did an immense business very successfully. After the Centennial the men made application for a slight increase of pay. Instead of granting it, along in the following month of March, I think it was, Franklin B. Gowan, as president of the road, issued his printed circular, requesting his engineers to leave the brotherhood or leave his service. It was a peremptory demand. Men were handed those circulars, some of them, while oiling their engines at the station. We were sent for. We met with the men at Philadelphia. The question came up, whether they would remain with the Reading Company or with the brotherhood. They decided by unanimous vote to remain with the brotherhood. Consequently, they all quit in a body, with the exception of 12, expecting by so doing that the company would not be able to fill their places, but they did. They filled their places. Those men scattered over the country, and the brotherhood paid them under the laws of the organization so much a month for 3 months. The men who took the places of our men joined the Knights of Labor later on, and afterwards had a strike, and some of the old men, who lost their jobs in 1877 and were still in that

section of the country, took the places vacated by the Knights of Labor, and for so doing they were charged with being scabs. During the strike on the Chicago, Burlington and Quincy road a gentleman came to Chicago and represented himself as being master of the Knights of Labor lodge at Reading. He stated that many of our men had taken the places of their men, and if I would call them off he would take his men back home. He had brought a carload to Chicago. I told him I had no authority to do that, but I would request the chairman of our executive committee to go to Philadelphia and investigate, and if he found our men had taken the places vacated by those men to ask them to withdraw and promise them pay from the brotherhood. He went to Philadelphia and investigated and found it was not so. Somehow or other this telegram that I gave to the chairman of our committee got into the newspapers, which angered Mr. Corbin, who turned against our brotherhood. Up to that time he had been our friend, but would not employ after that time a brotherhood man on the Reading road, and that gave rise to what you speak of, blacklisting the men.

Q. The road was in the hands of receivers part of that time?—A. No; that was later on. Later on, when Mr. McLeod was receiver—that was the last time I had anything to do with the Philadelphia and Reading road; he afterwards went to the New England road—2 of our men were discharged. It was represented to me that they were discharged for joining the brotherhood. I took it up with Mr. McLeod at that time. He produced a paper that one of our men had signed on entering the service of the company, wherein he agreed not to join any labor organization. He turned to me and asked me if I sustained men in violating an agreement of that kind. I said, "No, sir. If that man signed that paper which you produce, I have nothing further to say. In this case," I said, "here is another young man who has never signed any paper and was called into the office by Mr. Swigert (who was the general superintendent) and asked if he was a member of the brotherhood, and when he answered in the affirmative, he was discharged. I want you to reinstate that young man." He said, "Where is he?" I said "Down stairs." "Bring him up." I brought him up. He asked the young man the question and he answered it just as he told me, and he reinstated that young man and paid him for what time he was off, which was all we could ask. That satisfied me that they were not proscribing men for belonging to the brotherhood. They preferred, when they entered the service, that they should not be members of any organization, but if they employed them and it came to the knowledge of the officials that they were members they were not disturbed for that.

Q. What were Judge Paxon's relations to your organization?—A. That occurred with the trainmen, I believe. He was charged with discharging 2 members of the Brotherhood of Trainmen. He was charged with being an avowed enemy to organized labor. For that reason organized labor protested against his appointment. I did not know the gentleman. All I know is what I have been told.

Q. Your organization among others?—A. Yes.

Q. What is the attitude of your organization on the subject of immigration?—A. That question has not been brought before our convention, yet I feel safe in assuming the responsibility of speaking for the organization on it: We are in favor of restricting immigration, believing it would be for the best interests of the country at large.

Q. (By Mr. PHILLIPS.) Your organization is not directly affected by it?—A. No.

Q. (By Mr. KENNEDY.) How about indirectly?—A. It is indirectly affected in this way, just the same as any other branch of industry, that after awhile it creates a large surplus of workmen.

Q. (By Mr. FARQUHAR.) How do you propose to restrict, educationally?—A. I would have it educational.

Q. (By Representative LIVINGSTON.) Is that the only restriction you would put on it?—A. No; I would add property; that is, a financial test.

Q. How much would you require each immigrant to own and possess in his own right in money or anything else?—A. I do not think I would be justified in prescribing a limit. If he had anything at all, he ought to have sufficient so he would not become dependent on the community.

Q. What do you think that ought to be?—A. I think it ought to be at least \$500.

Q. (By Mr. KENNEDY.) Do you think your organization would support a bill in Congress restricting immigration?—A. I think it would; yes.

Q. (By Representative LIVINGSTON.) Any other way in which you would restrict it?—A. I do not know of any other way.

Q. Would you restrict them in their rights of becoming citizens?—A. Perhaps I have peculiar views upon that question. If I had my way I would qualify the ballot. I would not allow any man to vote who could not read or write.

Q. English or German or Italian?—A. Could not read the ballot that was printed for him in this country.

Q. That means English?—A. That is my answer. I regard the ballot, the way it is used now, as a farce and a mockery. Men go up to the polls and deposit a ballot at the behest of somebody else and do not know what they are doing.

Q. You think, then, the commission should recommend to Congress a bill with all those disqualifying schemes in order to have these elements eliminated wholly?—A. Yes, I think it should.

Q. (By Mr. FARQUHAR.) What are your views on compulsory arbitration?—A. I have always been in favor of arbitration, but there has been so much said, and a great deal of opposition manifested, on compulsory arbitration, that I have dropped that part of it. Still I never could understand why there should be reasonable objections raised to compulsory arbitration, so far as it applies to railroads. They have the Interstate Commerce Commission that regulates and controls the railroad companies in regard to rates, which makes it compulsory on the part of the companies to submit to the rulings decided upon.

Q. Do not the Interstate Commerce Commission claim they have not enough power to carry out what they find?—A. They want more, and I guess they will get it.

Q. (By Representative LIVINGSTON.) Arbitration, to be arbitration, must be compulsory, must it not?—A. I think so; unless there is some way to compel parties to abide by the award, some penalty attached—it is left simply to their honor.

Q. (By Mr. PHILLIPS.) Did you not embrace your views, as well as the views of the brotherhood generally, in an arbitration bill which has recently become a law?—A. Yes.

Q. (By Representative LIVINGSTON.) What is your opinion of the last act; does it cover the ground?—A. It covers the ground as far as it goes; it is simply this: public sentiment is worth a great deal to any party engaged in a dispute; and if it is known to the public that one party to a dispute offers to arbitrate and the other refuses, we would have public sentiment in our favor. That is one advantage to be derived from the arbitration bill.

Q. How much effect on corporations, moneyed syndicates, does public opinion have when they take a near cut to get a thing?—A. When public sentiment is thoroughly aroused it generally has its effects sooner or later, and will continue to. We can not afford to ignore it.

Q. Have you had any cases of arbitration under the law passed by the last Congress?—A. No; fortunately for us there has been no occasion. We have been able so far to adjust every case we have had. We have had some 7 or 8 cases. I just returned from St. Paul, where we had a case. President Stickney and I had a very pleasant conference and succeeded in effecting a very amicable settlement; consequently, so long as that can be done there will be no occasion to avail ourselves of the justice of that law.

Q. (By Mr. PHILLIPS.) If you did not agree in the case to which you refer, would you have to offer to arbitrate under this law?—A. Yes, we would have made the effort.

Q. Do you have an idea that the existing law had anything to do with your settling that, knowing that it would be appealed to?—A. I think not. I think that the man we had to deal with, being a fair man, known as such, had more to do with it than anything else—the disposition to listen and do what was right.

Q. (By Mr. KENNEDY.) Have any of your organizations made any criticism as to the operation of section 10 of that law?—A. Not that I am aware of.

Q. It has been stated that it is evaded by the railroad companies, in some cases, by not having employment for a man who applies for work and does not express a desire to become a member of the beneficial association. Do you know anything about that?—A. In a general way, we have heard complaints, but nothing official. I know this, that men have entered the service of the Baltimore and Ohio Company without being required to take it out; that is, it was not one of the conditions upon which they were employed. It is pretty generally understood that in accepting service they also become a member of that relief association.

Q. It is believed to operate in this way, that if they come and ask for employment, and also signify a desire to become members of that association, they get employment, and if not they do not get employment?—A. There may be something in that. Still, I have sent quite a number of engineers there and have not heard any complaint from them on that question, and I very seldom allow myself to form any opinion on rumor. If I get anything official, authentic, then I am prepared to pass on it; but you know men talking say a great many things sometimes, and when you come to investigate them there is really nothing in them.

Q. (By Mr. FARQUHAR.) Has the question of incorporating your organization been before your annual meeting at any time?—A. Yes; our insurance departments were incorporated. We were obliged to have them incorporated, and they have their own officers now, and a board of trustees. That was brought about through the action of 2 men who joined our brotherhood in the city of New York. When a man joins the brotherhood he is required to take out and carry at least one insurance policy. After they became members they refused to comply with that law, consequently they were expelled. They laid their case before an attorney in the city. This was some 5 years ago; and we learned for the first time that we were doing business in the State of New York contrary to law as an insurance association. As soon as we learned that we consulted an attorney and he told us to become incorporated and take out a license. They had to have their own trustees, and in that way the insurance department became incorporated; but the brotherhood proper is not, and some objections have been raised by the delegates to becoming incorporated because they say each individual member could be sued and recovered against in case of trouble, and consequently there has never been any effort made to become incorporated.

Q. Was it your opinion that it was rather unsafe for the labor organizations to become incorporated?—A. According to that ruling. Now, for instance, Mr. Ashley sued me for \$300,000 damages. He sued me as an individual, as an officer of the association, on account of telegrams I sent out. We learned from our attorneys that they could recover; it would depend upon the jury how much judgment they got; but through the attorneys it was settled out of court on the payment by us of \$2,500. That grew out of cars of this company being detained with perishable freight.

Q. (By Mr. PHILLIPS.) Would not the incorporation of labor organizations free the individual members from legal responsibilities?—A. They tell me not—if he had anything they could get.

Q. (By Mr. FARQUHAR.) Then you do not think that there is any advantage to the labor organization in its becoming incorporated, unless it is to cover funds of the organization or the insurance?—A. They require bonds. We are under bonds for \$25,000. Mr. Ingraham and the officers of the insurance department and the secretaries of the local divisions handling money are all under bonds, so that the members are protected in that way.

Q. (By Mr. KENNEDY.) Have you had any experience with boycotts, or do you resort to it in your organization?—A. We did until the Supreme Court decided against it. They called it the boycott. If we had a strike, if you please, on the Pennsylvania road, under our rule the members of the brotherhood on any other road would not be permitted to handle the Pennsylvania cars, but the Supreme Court decided it unlawful, consequently we eliminated the rule.

Q. Have you anything to say about proposed legislation to strengthen the Interstate Commerce Commission outside of what you have said in your statement to the commission?—A. Nothing, unless it is that they ought to have power to punish for violation of any State law; upon investigation, they ought to have the power to punish the guilty.

Q. Do you believe railroad companies should be compelled to file with the Interstate Commerce Commission a full detailed account of all accidents, giving the causes of the accidents, names of the persons maimed or killed, etc.?—A. Railroad companies, just as individuals, ought to be compelled to comply with any law enacted by the Government. I do not know why a railroad company should be relieved or released from compliance with the law any more than an individual. In regard to the equipment of cars, you remember the time expired the 1st of last January. The railroad companies appeared before the Interstate Commerce Commission and appealed for an extension of 5 years. The representatives of the organizations thought that too long, and they protested against it.

Q. (By Representative LIVINGSTON.) On what ground?—A. Some of them had made no effort to comply with the law. We can not understand why they should be permitted to ignore the law any more than anybody else. Whenever they assign a good reason—poverty was the principal one—then it should be considered. Then the companies passed through a very serious time, just the same as the country at large. Under those circumstances they were entitled to consideration; but where a company took the position that they did not do it and at the same time acknowledged that they had been paying 8 per cent dividends right along, we did not think that a very good reason for noncompliance with the law.

Q. Are the railroads agreed upon uniform couplings?—A. I do not know whether they are or not.

Q. Does not that law require it?—A. It does not bind them to any particular coupling.

Q. The law requires that cars should be of the same height and have uniform couplings?—A. Yes.

Q. Have they attempted to comply with that?—A. I believe they have, so far as I know.

Q. (By Mr. FARQUHAR.) What is the usual duration of these written agreements between the companies and the men?—A. They are unlimited. Some of them embody a clause for 30, 60, 90 days' notice if either party desires a change.

Q. (By Mr. KENNEDY.) It is you who propose agreements to railroad companies, is it?—A. Of course in the early days it was something new for a committee to wait upon a railroad management. I believe I was the first to help make a written agreement with a railroad company in regard to wages and rules for the protection and government of the men. In some of the agreements 30 days' notice is required; others, 60; some, 90. If you desire any change you have to give that length of notice; and what led up to the agreement was simply this: The committee got together and presented a paper to the company; it was taken up and discussed; it was then reduced to writing by the company and printed, and went out as an agreement between the engineers and the company, signed by the general management and the chairman and secretary of the committee. That was the origin of them.

Q. (By Mr. PHILLIPS.) Do most of the railroads sign such contracts?—A. Yes.

Q. (By Representative LIVINGSTON.) Have you ever made a test in the courts of those cases, where contracts have been violated, for damages?—A. No.

Q. (By Mr. PHILLIPS.) What effect, if any, has the watered stock of railroads upon the employees?—A. That would only come up in a discussion between the committees and the company if they pleaded poverty. They generally go prepared to come back at that argument.

Q. Is it not a fact that there is a very large per cent of watered stock in a large number of railroad companies?—A. I would not like to say that; personally, I never knew it. We never trouble ourselves about them if they give us what we want.

Q. Is it your opinion that the employees could not receive better wages than they do if they were not compelled to work, or did not work, for companies which have a large amount of watered stock?—A. The railroad men in this country, as a rule, for the last year or two, have had no occasion to complain so far as relates to their wages, and with few exceptions they have been maintained all through the panic. We did in 1893 submit to a slight reduction on two or three roads, where we were called upon. For instance, the Louisville and Nashville requested a reduction; on the Southern they made a slight reduction, and on the Wabash. But outside of them the wages have been maintained, among the trainmen especially, so that they have been given no occasion to complain so far as that goes. We are getting the same rate of pay to-day—I am speaking now of the engineers, and the same may be said of the firemen—that we have been receiving for the last 15 years, with a few exceptions, and we are pretty well satisfied with the rate of pay we are now receiving, with one or two exceptions. Our men on the Southern Railway here have been striving to get their reduction restored, but Mr. Spencer has given very good reasons. He simply said to the committee he could not do it at that time; but he has agreed to take the matter up next August, and we expect then, when they are in a position to do it, that they will restore the 10 per cent, and I think they will.

Q. (By Representative LIVINGSTON.) Can you buy as much now with a dollar as you could 10 or 15 years ago, or more?—A. I think in some cases more.

Q. You are really getting more wages now than ever?—A. Yes.

Q. (By Mr. KENNEDY.) Were your scales pretty well maintained during the financial depression of 1893, until recently?—A. Yes; with few exceptions—the roads that I have mentioned.

Q. Was there a falling off in the number employed?—A. Oh, yes. You see, men employed in the train service as a rule are paid by the trip or mile. Their wages depend upon the amount of business done. That is one reason why we have not been called upon to submit to a reduction in prices, because there have been cases where men would not earn over \$35 or \$40 a month. If there were no trains to run there was no pay.

Q. The members of your organization are steadfast in their loyalty to the organization, are they?—A. As a rule; yes. Of course in 1894 a few of them broke away.

Q. (By Representative LIVINGSTON.) That 1894 scrape settled the fact whether they were loyal, did it not?—A. A large majority.

Q. (By Mr. KENNEDY.) The railroad engineers are in a position, practically, to enforce their reasonable demands and their rights?—A. We feel that we are, if driven to it.

Q. (By Mr. FARQUHAR.) Do you think your strength gives your men an incentive to strike when they have a difficulty that is not very great?—A. No.

Q. Do you think, on the other hand, that your strength restricts striking?—A. Yes; in the first place they can not have a legal strike without the consent of the grand chief engineer, and they never will get it unless they have a just cause. They know that.

Q. (By Mr. KENNEDY.) Has there been more or less striking since the organization of railway engineers?—A. Of course we know of no strikes among railroad men prior to the formation of our brotherhood.

Q. (By Representative LIVINGSTON.) You are speaking of one class of railroad men; not for the conductors, are you?—A. Yes; I speak for the train service so far as it relates to strikes, because I am familiar with it.

Q. Does not a strike depend upon an organization?—A. Not always.

Q. How can you strike unless there is an organization?—A. I will cite a case on the New York Central road. I never was employed on any other road. At the close of the war, the shopmen, the section hands—everyone but trainmen—went out on a strike. They had no organization. It was simply this: It started down in the city with the laborers on the street. They formed together and drove every man out of the shop who was not receiving over \$1.50 a day.

Q. You would not call that a strike?—A. It was a mob; they drove every man away. I have no doubt that the organization would like to have a law whereby an employee could recover for injuries received through the negligence of another employee, provided they could prove that this employee was incompetent and that was known to the employer.

Q. Suppose that employee to whom negligence is chargeable was not a member of your organization and the man hurt was?—A. We would not discriminate.

Q. (By Mr. FARQUHAR.) Then you think that the railroad companies ought to assume a little more liability in respect to accidents and damages than they do at present?—A. I do.

Q. Have you taken any action toward laying this requirement before legislatures or Congress?—A. Only in this way: The 5 organizations have decided to send a representative to Washington to look after legislation, and in that way protect the interests of the organization better than it would to have quite a number. We have a representative at Washington during the sitting of Congress. Then in each State we have a legislative board, which is supposed to look after legislation.

STATE OF OHIO, *County of Cuyahoga* :

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

P. M. ARTHUR.

Sworn and subscribed before me this 2d day of October, 1899.

WM. H. MARLATT,
Notary Public, Cuyahoga County, Ohio.

WASHINGTON, D. C., *October 5, 1899.*

TESTIMONY OF HON. MARTIN A. KNAPP,

Chairman Interstate Commerce Commission.

The commission met at 10.40 a. m., Vice Chairman Phillips presiding. Hon. Martin A. Knapp, of New York, chairman of the Interstate Commerce Commission, being first duly sworn, testified as follows:

Q. (By Senator MALLORY.) Judge Knapp, we recognize the fact that you are better acquainted with these subjects than the commission itself is, and we would prefer that you pursue such a course of statement as may seem best to you.—A. Well, you will permit me to say that I should prefer to be interrogated. I have made no special preparation for appearing before this commission for two reasons: I understood, in a general way, that you desire to make inquiry in respect to discriminations in freight charges, and that is a very broad subject. It covers nearly the whole railroad question. It is in a way the railroad problem, and I could not foresee whether you desired information respecting the causes of discrimination,

the facts of discrimination, the effects of discrimination, or the methods by which discriminations might be prevented; but as either one of these phases of the subject would require volumes, I may say, to exhaust, I could not, by any special preparation, anticipate the direction which your inquiries might take. And then, for a minor reason, I felt indisposed to appear to desire to utilize this commission as a medium for exploiting any views which I may entertain. If I can give you any information or make any suggestions respecting the subject of your investigation which will be valuable, I shall be very glad to serve you in that way.

Q. Is there no other branch of the subject that you have contemplated testifying on besides the subject of discrimination?—A. Well, I observe in the topical statement which your commission has issued that your investigation begins with the subject of the relations between railway corporations and their employees, and it occurred to me that perhaps you might desire to know something about the arbitration act which has now been in effect for something over a year. That measure was approved, I think, in June, 1898, and its substantial provision is to the effect that whenever a controversy arises respecting wages, hours of employment, or other conditions of service which actually interrupts or threatens to interrupt the movement of interstate commerce, either party to the controversy may apply to the Commissioner of Labor and the chairman of the Interstate Commerce Commission, whose duty it is, on such application, to put themselves in communication with the parties and endeavor, by mediation and conciliation, to bring about a friendly settlement. Failing in that effort, they are required to use their offices with a view of inducing the parties to enter into an arbitration; and if that method of settlement is accepted on their recommendation, then each of the parties appoints one arbitrator, and if the two thus chosen are unable to agree upon a third, the third arbitrator is to be appointed by the Commissioner of Labor and the chairman of the Interstate Commerce Commission. In only one instance has there been any attempt made to settle a controversy under the provisions of that act since it became a law. The controversy in that case related solely to the wages of a certain class of employees. It did not appear whether the controversy had assumed such a serious aspect as to actually threaten a strike or other interruption of the movement of commerce by the carriers complained of. Consequently the Commissioner of Labor and myself both agreed that the applying parties should make a written application, setting forth a state of facts which would confer jurisdiction upon us under the terms of the law, as otherwise it might be claimed that there was no controversy, and therefore we were not authorized to interfere. That view was acquiesced in by the applying parties, and presently a written application and statement of facts was presented, which upon its face showed a state of things plainly within the contemplation of the law; and thereupon copies of that complaint were sent to each of the carriers against which it was directed, with a request that they promptly answer in writing. They complied with that request, and within a few days those answers were received. Upon examination it appeared that, while the Commissioner of Labor and myself were treated with the utmost courtesy and the language of the answers was framed in the most respectful form, nevertheless they were substantially refusals to accept our offers of conciliation. In a word, they met the application at the threshold with a substantial declination to accept our friendly offices even to the extent of bringing about a settlement by conciliation, and of course accompanied that with a point-blank refusal to consent to arbitration. Briefly stated, their position was that where the controversy related only to wages, in view of the fact that the amount paid for wages is so large a percentage of the gross earnings of railroad carriers, they could not in justice to themselves or their stockholders submit that question to the determination of any other tribunal than themselves. In other words, that it was their right and their duty to decide for themselves without interference or advice as to the justice of the compensation paid by them.

Q. I infer, then, that the application for arbitration or conciliation was made on the part of the employees, and the refusal on the part of the employers?—A. That is the fact. Under these circumstances, the tender of mediation having been declined, we were clearly of the opinion that our duty was discharged and that there was nothing further that we could do, and the applying parties were so informed and furnished with copies of all correspondence; and there the matter, so far as we have any official knowledge, came to an end.

Q. (By Mr. FARQUHAR.) Who were the parties to this case?—A. I would prefer not to disclose the names of the parties, for the reason, and solely for the reason, that the representatives of the employees in this case were desirous that no publicity should be given to this controversy and no newspaper comment result from it; and it is entirely in obedience to their wish that I ask to be excused from disclosing the names of the carriers or the names of the employees who made the application. I have no personal objection whatever.

Q. (By Senator MALLORY.) Is that the only case that has arisen, to your knowledge, under that act of 1898?—A. That is the only instance in which any effort has been made to apply or utilize the arbitration law. I might add, what is the obvious conclusion, that the carriers in declining to accept the mediation of the officials named in the act, whose duty it is to tender their friendly offices for that purpose, virtually put themselves in the position, I think, of refusing obedience to the law. That is to say, after conceding that a controversy existed, as they did, and declining the official mediation which the law provides for, they in effect took the position that they would not accept the method of settlement which Congress has provided.

Q. Well, the law is purely voluntary?—A. Entirely so.

Q. (By Professor JOHNSON.) Do you think there are subjects of controversy that could arise that might be settled by this law, judging from your experience in this case?—A. Well, I can understand that if a controversy related to hours of employment or other conditions of service and that controversy was recognized as actually serious, and threatening to interrupt commerce, the mediatory offices of the Commissioner of Labor and the chairman of the Interstate Commerce Commission might be accepted, but, of course, I can not determine what would be done in any case until it arises.

Q. (By Senator MALLORY.) Had you, before making your proffer of mediation, examined into the facts alleged by the parties seeking your intervention?—A. Only to the extent of hearing the statement of their representative. He was invited to disclose to us, as fully as he desired, the circumstances out of which the controversy arose and the reasons which, in his judgment, warranted the class of employees he represented in demanding higher wages.

Q. In your judgment, then, and in the judgment of the Commissioner of Labor it was a proper subject for such action as Congress authorized to be taken under those circumstances?—A. I think it was clearly a situation within the contemplation of the law.

Q. After that experience, have you been able to form any opinion as to the utility of that law in cases of serious differences between the employers and employees of railroads?—A. No; the single instance in which attempt has been made to apply that law hardly warrants any general deduction, and I am no more competent, I think, to express an opinion on that subject than any other gentleman.

Q. Has it occurred to you that any amendment to that law, looking to the meeting of such a case as that, would be advisable?—A. I am not able to suggest any specific amendment which seems to me calculated to overcome the inherent and fundamental difficulty in all such cases. The very idea of arbitration, it seems to me, implies a voluntary submission; and having reference to the voluntary acceptance by both parties to the controversy of that method of settlement, I do not quite see how the law in that regard could be materially improved. If that method of settlement is accepted, it seems to be ample enough to permit an adjustment of almost any sort of controversy between railway management and railway employees; but if it is not voluntarily accepted of course there must be a deadlock in all cases.

Q. Do you know whether there are any laws of similar character in the States?—A. I know that there are State laws on the subject.

Q. Do you know anything about the working of those laws?—A. Only in the most general way.

Q. I believe this is the only piece of legislation that Congress has ever enacted on the subject of conciliation and arbitration?—A. I so understand it.

Q. And the status of that is now, after this one experiment, that if either side to a controversy between railroad employers and employees is not willing to submit the differences to mediation, that effectually bars any conciliation?—A. Yes. To put it in another way, if the railways generally, when application is made under the terms of this law, take the position which the carriers in this instance took, that they will not even accept the tender of mediation, of course nothing can be accomplished under the law.

Q. If I remember, you said that the reason assigned for that was that this was so vital a matter that they could not afford to submit. Is that a brief statement of it?—A. That was the position of the carriers—that in view of the very large percentage of their earnings which goes to employees, they regarded the question of wages as so vital to their financial solvency that they could not relinquish exclusive jurisdiction over that subject.

Q. Have you given any consideration to the question of compulsory arbitration?—A. Only in the most general way.

In further answer to the question you asked me a moment ago, as to whether this law can be improved in any way, and without proposing to suggest any respect in which it can be profitably amended, I venture to make this comment upon the theory

and plan of that enactment. It seems to me that the practical result will be in every case, even where the tender of mediation is accepted, either to bring about a settlement by methods of conciliation or a refusal to arbitrate. In other words, if the Commissioner of Labor and the chairman of the Interstate Commerce Commission, acting upon an application of this sort, enter into communication with the railroad management interested and do not succeed in bringing about an adjustment of the difficulty by that friendly mediation which, of course, would involve conferences now with one side, now with the other, and a most informal and at the same time most exhaustive examination of all the facts and circumstances in the case—if that does not result in a settlement, naturally the carrier would refuse to arbitrate for the reason that, as each side to the controversy would select one arbitrator, and as the third, who would ordinarily be the determining factor, is to be chosen by the Commissioner of Labor and the chairman of the Interstate Commerce Commission, if the first two chosen did not agree, it would hardly be expected that the third arbitrator would entertain a different view of the situation from the view taken by the chairman of the Interstate Commerce Commission and the Commissioner of Labor in the first instance, and therefore that the carrier or the employee would not accept any other result than to act on the recommendation of the officials in the first instance. As to whether the law can be improved in that respect I do not now undertake to say.

Q. Does not that view, if it is correct, bring that legislation down to a very unimportant position as a factor in the settlement of such troubles?—A. It certainly does; as I said, if the railroads generally take the position which was taken in this instance, that they will not accept the mediation provided by the statute.

Q. I am referring to your last remark in regard to the statement that you do not think it will ever reach beyond the period of conciliation; it will never reach arbitration.—A. I make that suggestion. It seems to me, in the nature of the case, if the method of settlement which this law contemplates is accepted by both parties, either there will be an adjustment as a result of the mediation of the officials charged with that duty, or a refusal to arbitrate, which would leave the matter just where it was at the outset; in other words, you come then to the question whether there can be any compulsory arbitration.

Q. I understand that you have not given that question sufficient consideration to justify you in expressing an opinion. Is there anything else on this branch of the subject that you care to state?—A. I observe that one of the subdivisions of this Part I relates to safety appliances. I can add nothing of value to what appears in the more recent reports of the commission to Congress, and to the statistical information, which will be placed at your disposal by our secretary, showing the present state of railway equipment.

Q. Under those statements it appears, I believe, that there has been considerable advance in the application of these safety appliances to railroads in the past, since the passage of that act?—A. Oh, a very rapid advance.

Q. And I also understand that, of course, we will have the fact in a statistical form, but I would like to have you state it. It is also a fact that there has been a very decided decrease in the fatalities and casualties to employees?—A. I think that is a justifiable inference from the data we collect. Of course, this should be borne in mind: During the period of transition from the old link-and-pin coupler to the automatic device, the danger in making couplings between a car that is automatic and one that is not is probably somewhat increased. Then there is further the want of familiar acquaintance, on the part of employees, with the new devices; and very recently our attention has been informally brought to a somewhat interesting feature of that subject, which is this, that a part of the automatic-coupling device which consists of what is known as the releasing rig, the lever to be used by the employees to avoid the necessity of going between the cars, either by reason of improper construction or imperfect adjustment, frequently gets out of order, and therefore the trainman is unable to unlock cars which are coupled by the automatic coupler without going between the cars, and sometimes the lever will not remain in position without being held there, which would compel the trainman, of course, to walk along if the train was moving, both of which things, of course, are quite as dangerous, and perhaps the former is more dangerous than the conditions which existed under the old link-and-pin coupler. So that until we get an automatic coupler in very general use, with all its appliances in perfect condition, so that they will operate according to their design, we can not certainly tell to what extent it will prove a life and limb saving device. My belief is that when those conditions are realized the loss of life and injury to employees will be very greatly reduced.

Q. Well, the air brake has advanced *pari passu* with the coupling, has it not, in being applied to freight cars?—A. Broadly speaking, I think that is the fact. The present indications are that by the 1st of January the safety appliances will be so

nearly completed or applied to so large a percentage of the cars that there will be no application for an extension of the time for completing that equipment, and that pretty much all of the equipment engaged in interstate transportation will be equipped in accordance with the provisions of this law.

Q. Now, those two branches I believe you have disposed of. Will you take up now the question of discriminations, and in the first place will you state whether or not, in your judgment, discriminations are practiced by railroads in this country?—A. Undoubtedly, at the present time.

Q. In what form or method is the discrimination against individuals most usually practiced?—A. Well, generally speaking, of course, by some secret arrangement which results in one person getting a more favorable rate of transportation than another person under the same conditions. The methods by which that result can be accomplished are limitless. I think it can be fairly stated at the present time that the instance of the actual repayment, to the shipper, of rebates is comparatively rare. Where concessions of the sort I am now referring to are made, they are brought about in some other way.

Q. Why should there be a cessation of the rebate system and the continuance of other systems? Is it because the rebate system is more open and more liable to detection than the other methods?—A. That is doubtless the controlling reason. Of course the law specifically prohibits transactions of that kind, as, indeed, it aims to prohibit all methods which practically accomplish the same result. And just now, as you are probably all aware, nearly every railroad in the country has all the business it can do. The necessity, therefore, to secure business by making concessions is not as great as it is when the volume of traffic is below the present standard. And then rates generally have been very much reduced, so that the margin of concessions which can be made and leave any profit at all to the carrier or any justification to the carrier for taking the traffic is in many cases and in a large part of the country exceedingly small. Then, I think I am warranted in saying that, through voluntary action and perhaps a better recognition of duty to the law and to the public, unusual efforts have been made during the last year by railroad officers to observe tariff rates.

Q. You speak of concessions. Could you mention specifically some of the different forms or any form in which concessions are made other than the rebate? We would like to get hold of some practical illustration of how such things are done.—A. As I said, the possibilities in that direction are almost unlimited. I hardly know where to begin to illustrate the range of methods which would have the result of giving one person better rates than others. Sometimes it is said that where a given road is largely engaged both in State and interstate business, as most of them are, they observe rigidly their interstate rates and secure business by making concessions to shippers on purely State traffic. That, you can see, is a wide opportunity.

Q. (By Professor JOHNSON.) I do not mean to ask you to state them, but I would like to ask you if you know that such instances actually exist?—A. In the nature of the case, I can have no such official knowledge. I can only say that such information comes to me as leads me to believe that what amounts to such concessions are made in that way. Then, of course, through the payment of commissions, through the purchase of supplies, the variety of ways is almost unlimited.

Q. (By Senator MALLORY.) Have you ever heard it said that there is any considerable discrimination effected by means of false weighing or improper weighing?—A. Oh, yes.

Q. Of bulk goods?—A. Oh, yes. The infirmity of human nature finds expression in that way very frequently.

Q. Well, have you had your attention called to any one of these various methods of concessions that seem to be more common, more usually practiced than any other?—A. Well, passing for the moment, then, to discriminations which are effected by such devices as false billing, false weighing, misdescription of goods, our information shows many instances in which practices of that kind have been indulged in. In fact, it is a matter of more or less public knowledge that several parties are now under indictment for misdescription of goods. As, for example, a large hardware house, having very extensive dealings over a large section of the country, ships a carload of goods described as nails, if you please, which are taken at a comparatively low rate. That car, upon examination, would be found to contain shelf hardware, fine cutlery, tools, and various other commodities which, if carried according to the classification, would bear a much higher rate.

Q. And that is done in single instances to the detriment of others, is it?—A. Undoubtedly. To illustrate, and without mentioning names or places, which I assume you do not care to know about, complaint came from one great trade center in the country, where there are numerous houses dealing in that general class of merchandise, that their trade in a certain section of the country was materially

affected and injured by practices of their rivals at another trade center sending goods into the same consuming territory under false billing and false weighing; and without going into details, I think there were circumstances in that case which justified the accusation.

Q. As a general rule, why is it that one party is discriminated against and another is discriminated in favor of; what consideration is there for that distinction?—A. The general answer to the question is the competition between the carriers. Where two or more rival roads are actively competing for the carriage of goods from one producing section to another consuming section, or between any two great centers of trade, and there is not business enough for them all, it is a natural, if not an inevitable, result that efforts will be made by each of them to a greater or less extent to secure business by some sort of concessions. In other words, the competition between the carriers is the excuse always advanced, and probably the actual reason in nearly every instance for the discriminations which occur. I have no knowledge of any instances in which discriminations of that sort were made by arbitrary action of the carrier—that is, through any desire to help one man or injure another. That may have influenced concessions in incidental cases, but ordinarily, I think, it is the competition between the carriers and the necessity which they avow of getting business which leads to these secret practices. Of course, coupled with that all the while is also the sharp competition between different producing and consuming territories.

Q. Well, then, according to your view of it, in prosperous times, when the railroads have about all they can do, naturally there is less of this than there is when times are dull and they have to hustle for trade?—A. That we should all expect to happen, and that does happen.

Q. Can you give us some idea of how discriminations between places are carried on or practiced?—A. Let me approach an answer to that general question by a preliminary statement. I think it is well to keep in mind, and perhaps to emphasize, a point which seems to me often lost sight of, and that is the difference between those discriminations which are effected as between individuals through concessions from the published rates and those discriminations between communities or commodities which result although the published rate is rigidly enforced. What we ordinarily mean by individual discriminations—that is to say, the circumstances under which a shipper at a given place gets more favorable rates than his rival at that place—are always brought about by some departure from the published tariff. Of course there is the open rate appearing upon the tariffs of all the roads; everybody knows what it is, and therefore if one person is favored against the others that means, of course, that that person gets something off or something below the published tariff, and, as you all understand, there may be the most rigid and absolute observance of the published tariffs and yet the most serious discrimination result because the tariffs themselves are improperly or unfairly adjusted as between different communities or different articles of traffic.

Q. In the case of discriminations against individuals, as I understand it, it is by reason of the nonobservance of the tariff rates which may be adjusted?—A. Yes.

Q. And in the other, it is by the observance of an unfair tariff?—A. Precisely. You may have a perfectly just tariff, just as between communities, as between individuals, as between commodities; and then injustice may result from departures from that tariff. You may have perfect observance of tariffs and yet great injustice because the tariffs themselves do not fairly and equitably adjust the burdens of transportation as between different communities or different articles of traffic.

Q. Can you give us an illustration, from your experience, the past experience of the commission, of a case of that kind, of discrimination between places? I am speaking now of flagrant discrimination, something that is palpably a discrimination in favor of one place as against another on the line of a railroad.—A. Well, I venture to take a situation that is pretty well known as an illustration. For many years there has been a basis of rates from the Atlantic seaboard, the great manufacturing territory of the country, to the western cities of distribution or consumption, so that the rates from, say, New York, for example, to Chicago and St. Louis and Kansas City, are adjusted with reference to each other with, I may say, a fair recognition of distance and other conditions of locality; and it so happens that the rate on first-class goods from New York City, all rail, to Kansas City is, I think, \$1.47, and proportionately less to St. Louis and Chicago; and on that general basis all the rates over the most important section of the country are adjusted; and you can readily see that the maintenance of rates in particular localities depends upon maintaining the general basis of rates, otherwise the whole transportation system would be thrown into disorder. Now, not long ago there was constructed what is known as the Kansas City, Pittsburg and Gulf road, running almost directly from Kansas City to the Gulf of Mexico. That road became insolvent and receivers were appointed.

That railroad, in connection with the Mallory Steamship Line, which takes goods from New York to Galveston, after various intermediate reductions, finally put in a rate from New York City to Kansas City at 80 cents as against \$1.47 by the all-rail lines, with the result that a very considerable amount of traffic moved by a circuitous route approximately $2\frac{1}{2}$ times as long as the direct route, making, of course, higher rates from New York to St. Louis and from New York to Chicago than from New York to Kansas City, a condition which, in a way, is illogical, and so, of course, can not permanently continue. I am not saying now whether the interested carriers were justified or not; that is not the point; but the effect, of course, was to bring about discriminating rates between the greatest trade centers of the country, because anyone can see that the rate from New York to Kansas City should not be lower than the rate from New York to St. Louis or from New York to Chicago. And yet during the last three or four months that has been the actual condition, that a very considerable amount of traffic has gone from New York to Kansas City, by way of Galveston, at a rate only a little more than half the standard rail rate from New York to that city.

Q. Can you say what conditions brought that about?—A. Well, I only know the excuse which, I understand, is put forward by the receivers of that road. They insist that they were entitled to what is known as a differential; that is, by reason of their circuitous route, the greater length of time which it would require to take traffic from New York to Kansas City by that route, the cost of marine insurance, and all that sort of thing, they could not get any of the business at the same rates as the all-rail lines; and therefore they ought to be allowed to charge somewhat less, with a view of getting what they claimed was their share of the business. And it was the refusal of the other lines, the all-rail lines, to concede the differential claimed which led them to get the differential by force. I may add, for your information, that by recent action of Judge Thayer, who appointed these receivers, they have been ordered to restore the rates which existed at the time this controversy arose. Of course, all that was complicated, and I mention it to illustrate the intricacies of the whole situation; that is, the water lines down to Savannah and Charleston and then the rail lines from there across the country to the same destination.

Take another illustration drawn from a very recent investigation and which, very likely, Commissioner Prouty will speak on more fully in some of its other aspects. We have been investigating the exports of grain and grain products, and the fact appeared that in some instances and through some of the gateways, through some of the ports, the rate on flour exported was often as high as 11 cents per 100 pounds above the rate on wheat. Now, obviously, if there is any such difference as that or anything approximating such a difference between the rates on exported wheat and exported flour, there can be no exportation of flour, and of course the mills and millers of the country who have large investments and large capacity for supplying the foreign demand for flour would be, if that state of things continued, entirely shut out of the business and the exportation would go abroad in the form of wheat and the flour would be made by the foreign miller rather than the domestic miller, and yet all those discriminations, as you see, can be accomplished with absolute adherence to published rates. They were not, as a matter of fact, in this case; but that is quite possible. Of course I assume that you are all perfectly familiar with that class of discriminations which has been the subject of repeated and grievous complaint which results from the disregard of what is known as the long and short haul clause. The act to regulate commerce contemplated that carriers subject to its provision should not in any case charge more for a short distance than for a long distance in the same direction, where the short distance was included in the long distance, except under conditions which would warrant the commission in allowing that exemption from the general rule. Well, without going into that subject, because I could spend a whole session talking about it, the Supreme Court has construed that section or provision of the act in such a way as to make it substantially nugatory, and as a matter of fact, especially in the territory south of the Potomac and east of the Mississippi River, the injury to small towns which results from higher rates to them from the great centers of production than to the larger cities of the South more distant, has been serious and is still serious. To a great extent similar conditions exist with reference to the transcontinental traffic, rates all rail to the Pacific-coast terminals being ordinarily much higher than to many places in the interior. Of course the justification put forward in all those cases is the competition of water carriers and the necessity, often actually a justification fairly satisfactory in many instances, that they must approximate the rates of the water carrier or else they can not get any of the business. But whatever may be their necessity or justification, the fact remains that the interior town is put at a serious and often at a fatal disadvantage.

Q. There is a species of discrimination to which my attention has been called

which you have not mentioned exactly; at least, I do not think it falls under any of these heads; and that is the charging of different rates over the same road in different directions, on the same line of road. For instance, from my State, Florida, up to New York, and the same cars coming back, there is a different rate per hundred charged?—A. Oh, yes.

Q. Now, the excuse that is offered for that, the reason, as I understand it, is that they have to bring the cars back anyhow; they have to get down South from here, and it is better to get something than nothing for it. Have you had occasion to consider the validity of that excuse or reason?—A. Oh, yes, in numerous cases; that is, to consider the general question which that situation raises. I recollect, without being able to give exact figures, an investigation in which it appeared that a certain railroad system charged a good deal more for carrying petroleum products south bound in tank cars to certain interior destinations than it charged for carrying cottonseed oil, a much more valuable product, in the contrary direction in the same cars.

Q. Now, the reason, I suppose, is the same in that case as it was in the one to which I referred. Is that, in your judgment, a sufficiently strong reason to justify the discriminations which are practiced?—A. I do not hesitate to say that I do not think it is sufficient. Of course, gentlemen, you all understand, I assume that it depends on the point of view. If you accept railroad transportation as a purely private enterprise, to be conducted like a farm or factory, then the financial interest of the carrier may justly lead it to many and obvious discriminations; but if you say, as I think we are all now disposed to say and presently everybody will say, that railroad transportation is not a commodity, not a private enterprise, but purely a public service, and that public rights are to be considered at least equally with the rights of the carriers, then, of course, the asserted justification often entirely fails, and discriminations, which might be excused on the theory of private enterprise, become palpably insufficient and inadequate when you contemplate the railroad system as an agency of the State.

Q. Of course, I do not undertake to cover all these various kinds; but there is another species of discrimination which I would like to hear something from you on, as to its character and its extent, and that is the granting of free passes. You say that you know of no instance, or if there are instances they are very few, in which individuals are discriminated against because of their personality or discriminated in favor of because of their personality. The matter of granting passes to individuals over their roads by the railroads of this country, as I understand it, is a very general practice?—A. Your question very properly implies a criticism upon my general statement, which was designed to apply to rates of transportation of freight.

Q. I did not intend any criticism.—A. I know you did not; but I ought to have modified it in the direction of freight. Undoubtedly, when it comes to granting free passenger transportation the action of the carriers is in a sense arbitrary; of course, doubtless always influenced by considerations of self-interest. They presumably expect that they will receive corresponding advantages, or at least they find themselves placed in a situation where they can not well afford to refuse, as they think, the demands for free transportation. Of course, that is not an evil of the first magnitude as compared with the other subjects to which I have alluded, and yet it is one of very considerable importance, and one which in my judgment is without any excuse.

Q. It is the abuse of the principle more than anything else, of the principle that railway rates should be equal and fair in their application to the individual?—A. To give an illustration to the extent to which that sometimes occurs, although the general conditions are nothing like what this instance would indicate, a gentleman told me that on one occasion he came from Chicago to Washington just along in the latter days of November, and every other passenger in the Pullman car, besides himself, was a member of Congress or other Government official, with their families, and that he was the only passenger who paid a cent for transportation from Chicago to Washington, either for his passage or for his Pullman car.

Q. (By Mr. FARQUHAR.) Is there any remedy for such a condition of things that you could suggest?—A. Well, I should despair, Mr. Chairman, if there was not a remedy for what I regard as so grievous an injustice.

Q. Is it not a fact that this class of discrimination against the paying passenger is usually extended by free passes to all the legislatures of the State and to Congress itself?—A. Well, it is a general fact, as I understand, that representatives both in the State and National legislatures are very generally, if not always, offered free transportation. I am aware that it is not accepted in all cases.

Q. After the passage of the interstate commerce bill, was it not a fact that all the passes that had been issued to members of Congress and legislatures were taken in

by the roads?—A. I do not know what the fact was in that regard. I was not a member of the commission until several years after; but I have some sympathy with the view which is expressed in some such fashion as this, that the law is used by the railroads when they do not want to give free transportation, and when they do want to do it they find a way to do it.

Q. Is the usual plan adopted by the railroads of issuing passes for newspapers or newspaper men?—A. Oh, that is one of the forms which the transaction takes.

Q. Also for advertising?—A. Yes, a pass that permits of free transportation in some way is furnished ostensibly for newspapers as consideration for advertising their time tables, etc., and then the recipients of these favors distribute them to their friends. And then I happen to know in many cases that passes are given which on their face are limited to transportation within the State, there being, except in some States, I think, no law against it; so that if a person is fortunate enough to have passes of that character covering the territory of one, two, or a dozen States through which he desires to go, why, he finds a method of getting himself carried without paying much, although he may have no pass for the whole journey.

Q. Has your commission ever investigated how far the pass system enters into the passenger system of the country; that is, the proportion of passes to the paid fares?—A. No.

Q. Not even one small case?—A. Not with a result which would enable me to answer your present question, or showing the percentage. It is very difficult to estimate. There are free passes of all the sorts that have been alluded to and perhaps some others. There is the free transportation given sometimes to the shippers as a consideration for getting their business; there are reduced rates for round-trip tickets, which are manipulated through the scalping offices. It would be impossible to say to what extent that results in diminished revenue to the carrier. I have heard it claimed—I know nothing about it, and make the statement only on that information—that probably the actual revenues received by all the railroads of the country from their passenger business did not exceed 75 or 80 per cent of what they would be at the published rates multiplied by the journeys actually taken.

Q. If it would be possible to abolish this pass system, which is just as bad a discrimination as the freight, in fact worse, what effect do you think it would have on the cash fare—would it lower the rates of a paying passenger or would not the railroads charge the same, taking the usufruct of the whole for themselves?—A. What would result I can not say.

Q. What would be your opinion, in your Interstate Commerce Commission, about a question of that kind?—A. I should feel warranted in answering your question this way: If we could eliminate the free transportation and bring this public service down to the impartial conditions where every person who uses it pays his proper share, I believe the passenger rates throughout the country could be materially reduced and still the railroads have better returns from that branch of their service than they have at the present time.

Q. Is it possible to amend the interstate commerce bill to abolish passes?—A. I think so, surely, and a good many other things that now occur.

Q. (By Mr. RATCHFORD.) Is it not a fact that professional men and ministers of the gospel usually are provided with passes?—A. I am not aware that professional men as a class ordinarily receive any concessions, but clergymen as a rule get half rates.

Q. (By Mr. KENNEDY.) Does the practice extend to Federal and State judiciary and district attorneys?—A. I do not know. I think the practice is diverse. My opinion is that in many sections of the country the judiciary, both Federal and State, have free transportation. In some cases it is not accepted. In some States it is prohibited, in others it is in a way recognized as one of the perquisites and emoluments of the office.

Q. (By Professor JOHNSON.) It was testified before your commission by an officer of the Louisville and Nashville that his railroad gave passes to judicial officers.—A. Yes; but there is no such general practice, I mean to say, as corresponds with the arrangement in which clergymen get half rates. That is quite universal.

Q. (By Mr. RATCHFORD.) What can be the motive of that?—A. In the case of clergymen?

Q. Yes. What is the motive of the railroad?—A. Broadly stated, charity; consideration for their profession; benevolence, and, presumably, unselfish. It is in harmony with the general sentiment and action which prevails that gives concessions to the clergy in other directions.

Q. It would seem, then, the transportation companies, in giving passes and discriminating rates, have motives other than unselfish motives in some cases?—A. Oh, yes. So far as a corporation can be unselfish, I think railroads are as corporations unselfish.

Q. (By Mr. FARQUHAR.) Is it not a fact also that the parties who apply for passes may have some claim on the railroad—for instance, boards of assessors in cities, aldermen, councilmen, and sealers of weights and measures, clear down to the rod-men who belong to the engineering department—and while they have a pull, as it is popularly called, that pass is usually handed to anybody and everybody having no rights whatever to free transportation?—A. That may be the case, but I do not know of any such instances.

Q. Have you ever had before your commission any question of that kind regarding the class of people who really do receive passes—the list that was published by order of the Senate through request of Senator Chandler with respect to a road in New England?—A. Oh, yes; there was an investigation in the case of the Boston and Maine Railroad, and they were required to disclose to the commission the classes of persons to whom they gave free transportation. That investigation was published at the time and was afterwards, as you mention, published by some resolution introduced by Senator Chandler. I should take pleasure in furnishing a report of the commission in that case, and I might say that is a fairly typical case.

Q. Could you succinctly state it to the commission now—the facts?—A. The statute contemplates a state of things in that regard which if realized would express the view of the commission, unless I should say the statute does not go far enough. It seems to me the permission of law giving to one railroad the right to carry employees of another railroad free is a privilege which results in abuse.

Q. (By Mr. PHILLIPS.) Are there not a number of leading central points that are made equal, and shippers ship business through intermediate points to that point, beyond, and then reship perhaps 100 or more miles back in order to get a reduced rate, when the railroad would not stop the freight at the point?—A. Oh, yes—the situation which results from what is called the long and short haul clause. In such cases the general plan on which rates are made is this: The rate to the interior and noncompetitive point increases gradually with distance until it comes to a point where it equalizes the lower through rate plus the local back from that destination to the point in question. Of course they can not make it any higher, because otherwise they would ship through and ship back. The rates to these interior points, as a matter of fact, are equivalent to the through rate plus the local back. Of course the shipment does not go through. It is stopped off at its actual destination.

Q. (By Senator MALLORY.) Has your attention been called to the fact, in connection with the subject of discrimination, that certain railroads are going into other business than railroading and transportation per se; engaging in mercantile business, by the formation of companies in which their directors are the directors, separate and distinct, working in with the railroads?—A. I have no special information on this line. In a general way I think more or less of that thing occurs, but of course that is a natural outcome of existing conditions. It is asserted that there are instances in which the officers and managers of railroads have been interested in the development of towns through the personal ownership of land and in some particular line of business in which they were stockholders or otherwise interested, and that rates have been adjusted with a view of favoring those localities or those industries. That is a perfectly natural outcome, and undoubtedly things of that kind have occurred frequently.

Q. Has your attention been called to the concrete case of railroads combining or associating with or owning elevators—grain elevators—in Chicago and controlling the business of the elevator?—A. Yes; we have some information on that subject; but, if it is agreeable to you, may I suggest that you interrogate Commissioner Prouty, who is to follow me as a witness, and who is more familiar with the particular facts in that direction than I am.

Q. (By Mr. KENNEDY.) You stated it was possible to abolish this system of giving passes and stopped there. Would you state to the commission what you would suggest as an amendment to the interstate-commerce law to carry out that suggestion?—A. The best answer I can give to that question is to refer you to what the commission has stated in its last two annual reports to Congress and the recommendations which are put in the form of proposed amendments which appear in these reports. I am perfectly willing to express my own views, but they have been stated in these reports and in these recommendations with deliberation and with the attempt to be accurate, and reference to them would, I think perhaps, be more satisfactory to you than anything I could now say on the spur of the moment.

Q. Can you say briefly what these recommendations are?—A. That would lead us into a pretty long chapter; we should have to start at the beginning. It is apparent that any system of railway regulation begins with the requirement that the carrier publish its rates. I can not conceive of any legislation which amounts to anything or which purports to accomplish anything in the way of railway regulation that would not require as the foundation a publication of tariffs; the announcement to the public

of the charges which the railroad proposes to apply. Now, starting with that proposition, which I think commends itself to the intelligent reflection of everybody, you have two general classes of questions immediately arising. One question is, How are you going to secure the observance by the carriers of the published rate? How are you going to prevent departures from it? How are you going to put a stop to these individual discriminations which result in one individual obtaining the same service on more reasonable terms than another individual in like situation? Now, I do not know any way to handle that question except the way the present law proposes—that such transgressions are criminal misdemeanors and to be punished as such, because any civil remedy would be entirely unavailing. No suit for damages would be brought because the amount involved in any particular case is so inconsequential as to afford no remedy whatever; therefore we can only do what this law seeks to do—that is to say, treat transgressions of that kind as criminal violations of the penal law, to be punished as such; and I think that is a proposition which we must all accept in any view or any theory of public regulation. Now, that being so, the moment you say a transgression of that kind is a misdemeanor, you are obliged to treat it just as you would any other sort of criminal offense. You can not have any special way of dealing with it, and, therefore, a misdemeanor that comes from giving rebates would be prosecuted in the same way, by the same tribunals, as a misdemeanor under the postal, revenue, or any other laws of the United States—indictment, trial by jury, and all that sort of thing. Now, I conceive that more exact and unambiguous statements of the duty of the carrier to publish its rates (for the present law is very crude and imperfect in that respect), coupled with exact and determinable penalties for disregarding that duty, would help very materially to put a stop to the discriminations of that nature. Of course I do not hesitate to express here an opinion which I have long entertained. We shall not, in point of fact, under any system of laws secure exemption from injustice of that character as long as we attempt to keep up the compulsory competition of railroad carriers, which laws—mistaken, in my judgment—we now attempt to enforce. In other words, they create conditions which the necessities of human nature will compel to result in discriminations of the sort which we have now under consideration.

Q. (By Senator MALLORY.) That compulsory competition—do you mean by that the law which prohibits pooling?—A. Yes, and the antitrust law.

Q. You think the repeal of that clause would be conducive to fairer treatment of the public by the railroads?—A. I do, indeed.

Q. Has the commission made such recommendation?—A. Not as a commission; not exactly that recommendation. The commission's views, deliberately expressed, as I have stated, on that subject appear in these reports to Congress. I do not wish to be misunderstood on this point. While I believe these laws in their application to railroad transportation are unwise and against public interest, against the general good of the average citizen, I am not in favor of repealing them without at the same time having legislation which will enable the public to prevent a greater evil which exists or might exist under changed conditions.

Q. Your idea is that the repeal of the antitrust law and antipooling clause of the interstate-commerce law would be a long step in the direction of securing more equitable treatment of the public and individuals by the transportation companies. In addition to that you also would be in favor of specifically making misdemeanors of the violations of the law?—A. That is it. I put the two things together. I believe that rights of contract with each other which are now denied and prohibited ought to be granted to the railroad carriers, because they are engaged in a public service; but as a part of any such scheme of legislation I want a much more accurate and comprehensive definition of their legal duties, and a grant of power to the public authority, whether represented by a commission or some other tribunal, to prevent any abuse of the privilege.

Q. A supervisory power over the right to contract?—Yes, or over the results of the contract, which is the rates. That is a matter the public is interested in.

Q. As a matter of detail in regard to this provision for punishing infractions, on whom would you impose the penalty? Railroad employees are generally simply agents for their superior. Would there not be some question there as to justice, if you impose the penalty upon the man who actually committed the act and did it at the instance of a superior?—A. Plainly enough, the corporations ought to be indictable and punishable, and that is one of the glaring imperfections of the present law, that the corporation, which is the principal, which is the real offender, is not amenable to criminal process, but only the agent or representative of that corporation.

Q. (By Professor JOHNSON.) In addition to what you have already stated on discrimination, I think the commission would like to hear you state concisely the class of shippers that under existing conditions are most favored as a result of these dis-

criminations.—A. It is doubtful whether I can add anything to what is commonly known on that subject. In the nature of the case it must happen where railroads are in actual and sharp competition with each other that the shipper whose business is of the most consequence or largest in volume is the one whose favor is likely to be secured.

Q. Let me put my question a little more concretely: Is it the meat packer and miller, or the wholesale grain dealer—are those classes now receiving special favors?—A. Undoubtedly.

Q. The favors, then, do not go to the benefit of the consuming public or to the general producing public?—A. No; and if I might be allowed to digress a moment or enlarge a little on what I have tried to say, it all depends on the point of view and on the ends that we seek to secure. Now, there seems to be a vague popular notion that the public generally gets the same benefit from the competition of railroads that it gets from the competition of farmers or manufacturers, but I think that is a very mistaken idea. The industries and occupations of the world are so distributed that what we call competition results to pretty nearly equal advantage everywhere and to every person. If the resident of a remote hamlet thinks the crossroads merchant charges him more than he ought to, there is another little store only a mile or two away where he can get the same article. Generally speaking, competitive conditions are so general, so diversified, so complete all over that when it comes to the articles of use, wear, and consumption one man is not charged much more than another in purchasing the same thing at the same place; but when it comes to this railroad service, a moment's reflection shows you that only a small portion of territory and only a small portion of the population are so situated that they can have the benefit of railroad competition. Competition, it seems to me, objectively considered, is simply the power to choose between two or more persons who can furnish the same article; that is the objective value of competition to him. As I said, there are only a few people comparatively who have any actual choice between railroad carriers. To much the largest number of people in this country, by far the largest number, and throughout the greatest part of its territory, railroad service is and always has been an actual monopoly, and the result of the competition which grows out of rival railroads gives this opportunity for choice only to a few persons in some of the great centers. Now, if I may be permitted to suggest a further word, which will give you some information of the way I look at this matter from an economic point of view—as I said before, I want not only to consider the point of view, but the result to be accomplished. Now, I want to say this: First, on what I call actual property—I mean the things we eat, use, and wear, the products of human labor and skill—possibly some of us do, but I do not want uniform prices under present conditions. We want every producer to be perfectly free to get just as much as he can for anything he has to sell, and we want every consumer to be perfectly free to buy everything he wants as cheap as he can. We want the utmost freedom of contract between buyer and seller in everything that relates to property. Therefore, it seems to me, all those conditions which tend to abridge that freedom of contract, whether by controlling and limiting production, controlling markets, or in whatever ways which operate against the general good of the public, ought to be prevented, if they can be, because it seems to me this freedom of contract between buyer and seller of property is the very foundation of industrial freedom. I can not conceive of commercial liberty that does not involve that absolute freedom of contract; but when you come to railroad transportation, that is not property, but public service, which the State might lawfully do by its own direct agency, but which from motives of expediency only it commits to private corporations to perform, you do not want uniform prices; you do not want any freedom of contract at all; you want every person to get exactly the same advantage under like circumstances as every other person, therefore you want quite a different thing from what you want with respect to property; you want uniform charges; you want the burden of transportation to be just as nearly equal as possible on one person as on another. Therefore, all that tends under proper limitations to bring about absolute uniformity of charge and impartial treatment by those who perform a public service is a thing to be commended and encouraged by legislation. Why, gentlemen, it seems to me you can not have industrial freedom, commercial liberty in its full sense, without rates and charges for public transportation which are in the nature of monopoly. That is the thing that ought to be equal to everybody. That is the element which in no instance ought to cut any figure. So I say we mistake as to the results we desire to accomplish; we mistake the thing which would be to the general public benefit when we say those who are engaged in a purely public service shall not enter into contract relations with each other for the purpose of performing that service on terms of impartiality. I will put it in another way: Competition is simply discrimination. When

you analyze that thing you call competition, what is it? Simply the right of every man who has a piece of property to sell to one man at one price, and to another man at another price, or to vary that price to the same person when he thinks best. Of course railroad service can not be conducted on any such principle. Look at the conditions today. Suppose you have 2 great department stores in a town which supply its trade. Now, suppose the law required of those 2 stores what it now requires of the railroads—first, that they should publish all their charges on every article that they sell and that they should not vary the price to increase it without 10 days' notice, or reduce it without 3 days' notice; and suppose, in addition to that, it was made a criminal offense for them to vary on any article under any circumstances; and suppose they were required to report every year their capital, earnings, number of employees, wages, dividends, and all that sort of thing. Under that would there be any competition? If there was, it would be a competition in violation of that law which required them never to charge, in violation of their published rates; and that is the sort of competition we get now in railroad service. When tariff rates are actually and rigidly observed in all cases, there is no competition in rates; and when there is competition in rates it is when private concessions are made which result in giving one man an advantage over another. I do not mean to say that competition between carriers has not been a most powerful influence in bringing down the charges for railroad transportation to their present low level. Undeniably it has, and I am not at all suggesting that they should be allowed indefinitely and at pleasure to combine with each other without restrictions and conditions which give public authority adequate control over their rates and charges; but I do mean to say that you will not get that impartial treatment which every person is entitled to have and at the same time actual competition between the carriers.

I want to add another thought, which lies at the bottom of the whole thing; I do not ride on the railroad by virtue of any contract, but I use the agencies of the public carrier in the exercise of my political rights. I have just as much right to ride on the cars as I have to be protected in my person and property by the police administration; just as much right as I have to submit any controversy to the adjudication of our legal tribunals. I can not be excluded. The relations between railroads and patrons are not contract relations; the ticket is not evidence of a bargain; it is more in the nature of a tax receipt; it shows I have paid money which any person might pay and get the same service, and from which no person can be excluded. The merchant who sells goods has a right to stand on his threshold and say I can not enter his store. He has a right to refuse to sell me goods. He has a right to make one price to me and another to my neighbor at the same moment, but no railroad man can stand in his station and say I can not enter or say I shall not have all the privileges of service which his company can offer on exactly the same terms as any other man. I say you can not practically have that and at the same time have that actual constant competition which goes on in the industrial world.

Q. (By Senator MALLORY.) I think it is generally conceded that the popular position in the United States against permitting railroads to pool is based on the apprehension that they will utilize it to increase rates exorbitantly. Is not your understanding that that is the objection?—A. Yes; and I may be permitted to say again: We hear a good deal about trusts and combinations these days, and I do not care to go into that subject, but there is another thought which may be perhaps worth considering. We find no way, under our free government and consistent with constitutional liberty, to control the prices of property by direct legislation. Now, I suppose the objection to that tendency, which is now so marked, is possibly, so far as it is intelligent and thoughtful, based on the belief that these combinations do, or the apprehension that they will, use their power in such a way as to compel the consuming communities to pay more than they ought to and more than they otherwise would. We can not control the price at which they shall sell anything, because even if we could fix the prices we could not compel them to sell any more than we could compel the consumer to buy. As long as we can not fix the price we try by indirect methods to accomplish the same result. We try to prevent the combination. I am not saying whether that is right or wrong. It is not my province to enlarge on that phase of the economic question. The point I wish to make is that when it comes to public service, like railroad transportation, we can go right to the end we aim at and fix the prices. It is entirely competent for the State legislature and for Congress by direct legislation to say how much any carrier shall charge on any commodity or between any places. Of course that power is subject to the same limitations which is put by the Constitution on all legislation, that no man's property shall be taken without due process of law and that every man shall have the equal protection of the laws. But under these limitations the power of Congress over interstate, and State legislatures over State traffic is plenary and exclusive. Therefore the objections to the railway combinations

which apply to the industrial combinations have no foundation, because we can prevent any excesses or abuses of railway combination by direct legislation, because we have the authority to do it, unquestioned and ample.

Q. That is what I wanted to get at. The apprehension of the people of the United States, when this subject of pooling is brought up in Congress, is that by allowing them to combine and form pools they would put up rates exorbitantly, and thereby become oppressive. If they could be permitted to pool, and at the same time a law-making power be authorized to impose such wholesome restrictions upon extravagant rates as would insure reasonable rates, is it not your opinion that if the people could be brought to understand that they would acquiesce in it in view of the very manifest necessity for our giving some opening at least for them to make their own rates?—A. I do not at all doubt that is so. I think unless this question is clearly comprehended, unless it is comprehended by the ordinary man, what my distinguished predecessor, Judge Morrison, used to describe as the “low-down man”—if his interests are to be consulted, if his welfare is to be promoted, so far as it depends on public transportation we will undertake the elimination of all discrimination and bring transportation charges to one uniform basis. Now, it is easy to enlarge on that and suggest that the objections to this combination are not well founded, but I have no disposition to go into that. I desire to put my opinion solely on my observation and judgment of what is for the benefit of the average man. I do not believe the antitrust law or the prohibition of pooling in the effort to regulate commerce has ever been of one penny's benefit to the farmer from Maine to Texas, the wage-earner or the crossroads dealer, or the man in the ordinary walks of life, but it has practically, almost necessarily, resulted in giving the capitalists at great centers advantages to which they are not entitled and which in a large measure accounts for their enormous accumulations.

Q. Do you think if Congress were to show a disposition to repeal the antipooling clause, and at the same time put some supervisory control in the hands of somebody, whether a commission or some other body, so as to see that they should not become oppressive, that it would be acceptable to the railroads of this country?—A. It is not easy to answer that question. I could easily excuse myself by saying I do not know. So far as I can perceive, there is a considerable difference of opinion among railroad men, and certain great railroad corporations are now in a position where they do not want any legislation for themselves, and they are therefore unwilling to have any legislation which will be presumably or actually in the public interest. You know very well in some sections of the country, by methods of consolidation, and one thing and another, what we observe elsewhere as to competition between railroad carriers has been practically eliminated. Where that has been the result, so far as my knowledge goes, not only have rates not been advanced, but they have been somewhat reduced; the service has been improved and impartial treatment has resulted to everybody. From these sections of the country the commission rarely gets a complaint now, where the railroads by consolidation (and this is a process very rapidly going on, and liable to continue)—where the railroads by consolidation get more or less exemption from these competitive conditions. They are no longer, in the nature of things, in favor of the repeal of the present laws, and of course those roads or influences which they command will not be likely to favor legislation which would give the commission or any other tribunal any greater control than they now have (which is not very great) over their practices or their charges. So, when you consider the practical aspect of legislation, and the attitude of railroad management toward the general plans of legislation, which perhaps I have in a way suggested, you find the roads which do not need the privileges on their side will be against it presumably, and only the roads which do need it will favor it. That is so with roads and systems of roads in such sharply competitive relations to each other as to threaten their financial integrity and their future prosperity, and they will submit to very drastic conditions under which they will be allowed to relieve themselves, but roads which do not need that relief, of course, are not likely to favor the establishment of any commission or tribunal to have actual control over their practices and their charges. Then, again, it must be considered in a general way that the greater combinations whose shipments are so enormous as to be of first consequence to carriers are not likely to favor any scheme of legislation which would enable the roads to combine with each other to stand up against their inducements. My own belief is that influences emanating from these sources have been more potent than any other to prevent the passage of what I believe to be legislation in the interests of the great body of the people. As an illustration of that, and it is a phase of that competition which you ought to take into serious account, take the discrimination effected by the use of private cars—shippers' cars. Here is a great concern, no matter of what sort or in what business. Its shipments amount to train loads a day. Instead of using

you analyze that thing you call competition, what is it? Simply the right of every man who has a piece of property to sell to one man at one price, and to another man at another price, or to vary that price to the same person when he thinks best. Of course railroad service can not be conducted on any such principle. Look at the conditions today. Suppose you have 2 great department stores in a town which supply its trade. Now, suppose the law required of those 2 stores what it now requires of the railroads—first, that they should publish all their charges on every article that they sell and that they should not vary the price to increase it without 10 days' notice, or reduce it without 3 days' notice; and suppose, in addition to that, it was made a criminal offense for them to vary on any article under any circumstances; and suppose they were required to report every year their capital, earnings, number of employees, wages, dividends, and all that sort of thing. Under that would there be any competition? If there was, it would be a competition in violation of that law which required them never to charge, in violation of their published rates; and that is the sort of competition we get now in railroad service. When tariff rates are actually and rigidly observed in all cases, there is no competition in rates; and when there is competition in rates it is when private concessions are made which result in giving one man an advantage over another. I do not mean to say that competition between carriers has not been a most powerful influence in bringing down the charges for railroad transportation to their present low level. Undeniably it has, and I am not at all suggesting that they should be allowed indefinitely and at pleasure to combine with each other without restrictions and conditions which give public authority adequate control over their rates and charges; but I do mean to say that you will not get that impartial treatment which every person is entitled to have and at the same time actual competition between the carriers.

I want to add another thought, which lies at the bottom of the whole thing; I do not ride on the railroad by virtue of any contract, but I use the agencies of the public carrier in the exercise of my political rights. I have just as much right to ride on the cars as I have to be protected in my person and property by the police administration; just as much right as I have to submit any controversy to the adjudication of our legal tribunals. I can not be excluded. The relations between railroads and patrons are not contract relations; the ticket is not evidence of a bargain; it is more in the nature of a tax receipt; it shows I have paid money which any person might pay and get the same service, and from which no person can be excluded. The merchant who sells goods has a right to stand on his threshold and say I can not enter his store. He has a right to refuse to sell me goods. He has a right to make one price to me and another to my neighbor at the same moment, but no railroad man can stand in his station and say I can not enter or say I shall not have all the privileges of service which his company can offer on exactly the same terms as any other man. I say you can not practically have that and at the same time have that actual constant competition which goes on in the industrial world.

Q. (By Senator MALLORY.) I think it is generally conceded that the popular position in the United States against permitting railroads to pool is based on the apprehension that they will utilize it to increase rates exorbitantly. Is not your understanding that that is the objection?—A. Yes; and I may be permitted to say again: We hear a good deal about trusts and combinations these days, and I do not care to go into that subject, but there is another thought which may be perhaps worth considering. We find no way, under our free government and consistent with constitutional liberty, to control the prices of property by direct legislation. Now, I suppose the objection to that tendency, which is now so marked, is possibly, so far as it is intelligent and thoughtful, based on the belief that these combinations do, or the apprehension that they will, use their power in such a way as to compel the consuming communities to pay more than they ought to and more than they otherwise would. We can not control the price at which they shall sell anything, because even if we could fix the prices we could not compel them to sell any more than we could compel the consumer to buy. As long as we can not fix the price we try by indirect methods to accomplish the same result. We try to prevent the combination. I am not saying whether that is right or wrong. It is not my province to enlarge on that phase of the economic question. The point I wish to make is that when it comes to public service, like railroad transportation, we can go right to the end we aim at and fix the prices. It is entirely competent for the State legislature and for Congress by direct legislation to say how much any carrier shall charge on any commodity or between any places. Of course that power is subject to the same limitations which is put by the Constitution on all legislation, that no man's property shall be taken without due process of law and that every man shall have the equal protection of the laws. But under these limitations the power of Congress over interstate, and State legislatures over State traffic is plenary and exclusive. Therefore the objections to the railway combinations

tory, then if your adjustment of rates into that consuming territory, from Baltimore on the one hand and from Cincinnati on the other, is such as to give Baltimore an advantage, the Cincinnati dealer is practically shut out of that territory; and it does not matter, if the rate is actually observed, if it is an open rate to everybody, both from Cincinnati and from Baltimore, whether they become combined, or what you call a trust, having its plant at Baltimore, and being therefore the only producer at Baltimore—if the rates from Baltimore into the consuming territory are lower than they are from any other place where the same article is produced, the Baltimore producer, be he big or little, has practical control of that market.

Q. (By Mr. PHILLIPS.) Now, the newspaper press published a letter, probably the latter part of last year, which seemed to have been addressed to your commission from the receivers of the Baltimore and Ohio Railroad, from which it seems there had been discriminations up to that time, but they were to terminate on January 1, 1899. Did you or did you not receive such a letter?—A. We did; yes.

Q. Will you give us your views in regard to that?—A. Well, to fully explain all the circumstances connected with that communication, and the conditions out of which it arose, would require a recital of a considerable of recent railroad history. I said something in the early part of my examination about the absence of these secret discriminations, comparative absence of them at the present time, and perhaps it would not have been unfair to have mentioned this communication of the Baltimore and Ohio Railroad, and the attitude of that road at that time, as one of the influences which contributed to the improved state of things, aided by the enormous volume of traffic, and the other circumstances to which I alluded; but it is undeniably the fact, and so conceded by that railroad to be the fact, that it had allowed concessions which amounted to serious discriminations. I think the managers of that property, in connection with the managers of other great railroad systems in the east, about that time became very much impressed with the danger which threatened the financial solvency of all great railroads of the country. Now, an examination of the reports made by us for the year ending June 30, 1898, showed that about half of that railroad year had been a pretty prosperous one. As we understood, the first half of 1898 showed that the 8 trunk lines, on their business east of Buffalo and Pittsburgh, took in about \$250,000,000. These roads traversed the most prosperous section of the United States, and these railroads, understood to be among the most prosperous institutions in the world, took in that year approximately two hundred and fifty millions, yet after paying operating expenses, taxes, and interest on bonds they virtually had nothing left. Only 3 of them paid dividends on their capital stock, and 2 of those, the 2 largest of all, paid the dividends, not out of the earnings during that year but out of accumulations during previous years. Now, that was the state of facts for railroad managers of trunk lines to confront, and I think they perceived, what seemed very plain to me, that there is nothing which makes against the integrity of railroad revenues in the long run like secret concessions. It is made to one; it gets to be known, or believed, or understood, and that intensifies the pressure of others, and so on, and ultimately that rate, first granted secretly, early finds expression in an open tariff to everybody; so the tendency goes on toward reduced rates, a tendency so marked at that time, in view of the volume of traffic moving then, as to lead even the managers of the New York Central and Pennsylvania to look on the future with serious apprehension. And so I think in a way, the letter of the Baltimore and Ohio may be regarded as an indication that railroad managers in that part of the country had, so to speak, suddenly become aroused to the necessity of taking some action that would protect their revenues and arrest this tendency, which would leave them solvent, and so the Baltimore and Ohio says, We will take a public position, and whatever rate we publish we will actually observe.

Q. And has that been done since, to your knowledge, largely with them and other roads?—A. Yes.

Q. But did discriminations continue since 1898 to January, 1899?—A. Well, generally speaking, as far as I have known, the rates since that time, in what is known as trunk-line territory, have been pretty rigidly maintained.

Q. But prior to that time there were large discriminations?—A. Undoubtedly, very grave demoralization of rates. Of course, as concerns the ordinary movement of merchandise in that territory, I think the published rates are very seldom departed from. When it comes to the movements, both for export and otherwise, of grain and packing-house products, and some things of that kind where transportation is partly in other territory than trunk-line country, and by other roads, partly for export, and rates are participated in by ocean carriers, I think it is not improbable that the published rate has been disregarded in some instances.

Q. Can there or can there not be a discrimination which is a just one? Are there not circumstances in which that could occur?—A. Well, the law uses the term "unjust

you analyze that thing you call competition, what is it? Simply the right of every man who has a piece of property to sell to one man at one price, and to another man at another price, or to vary that price to the same person when he thinks best. Of course railroad service can not be conducted on any such principle. Look at the conditions today. Suppose you have 2 great department stores in a town which supply its trade. Now, suppose the law required of those 2 stores what it now requires of the railroads—first, that they should publish all their charges on every article that they sell and that they should not vary the price to increase it without 10 days' notice, or reduce it without 3 days' notice; and suppose, in addition to that, it was made a criminal offense for them to vary on any article under any circumstances; and suppose they were required to report every year their capital, earnings, number of employees, wages, dividends, and all that sort of thing. Under that would there be any competition? If there was, it would be a competition in violation of that law which required them never to charge, in violation of their published rates; and that is the sort of competition we get now in railroad service. When tariff rates are actually and rigidly observed in all cases, there is no competition in rates; and when there is competition in rates it is when private concessions are made which result in giving one man an advantage over another. I do not mean to say that competition between carriers has not been a most powerful influence in bringing down the charges for railroad transportation to their present low level. Undeniedly it has, and I am not at all suggesting that they should be allowed indefinitely and at pleasure to combine with each other without restrictions and conditions which give public authority adequate control over their rates and charges; but I do mean to say that you will not get that impartial treatment which every person is entitled to have and at the same time actual competition between the carriers.

I want to add another thought, which lies at the bottom of the whole thing; I do not ride on the railroad by virtue of any contract, but I use the agencies of the public carrier in the exercise of my political rights. I have just as much right to ride on the cars as I have to be protected in my person and property by the police administration; just as much right as I have to submit any controversy to the adjudication of our legal tribunals. I can not be excluded. The relations between railroads and patrons are not contract relations; the ticket is not evidence of a bargain; it is more in the nature of a tax receipt; it shows I have paid money which any person might pay and get the same service, and from which no person can be excluded. The merchant who sells goods has a right to stand on his threshold and say I can not enter his store. He has a right to refuse to sell me goods. He has a right to make one price to me and another to my neighbor at the same moment, but no railroad man can stand in his station and say I can not enter or say I shall not have all the privileges of service which his company can offer on exactly the same terms as any other man. I say you can not practically have that and at the same time have that actual constant competition which goes on in the industrial world.

Q. (By Senator MALLORY.) I think it is generally conceded that the popular position in the United States against permitting railroads to pool is based on the apprehension that they will utilize it to increase rates exorbitantly. Is not your understanding that that is the objection?—A. Yes; and I may be permitted to say again: We hear a good deal about trusts and combinations these days, and I do not care to go into that subject, but there is another thought which may be perhaps worth considering. We find no way, under our free government and consistent with constitutional liberty, to control the prices of property by direct legislation. Now, I suppose the objection to that tendency, which is now so marked, is possibly, so far as it is intelligent and thoughtful, based on the belief that these combinations do, or the apprehension that they will, use their power in such a way as to compel the consuming communities to pay more than they ought to and more than they otherwise would. We can not control the price at which they shall sell anything, because even if we could fix the prices we could not compel them to sell any more than we could compel the consumer to buy. As long as we can not fix the price we try by indirect methods to accomplish the same result. We try to prevent the combination. I am not saying whether that is right or wrong. It is not my province to enlarge on that phase of the economic question. The point I wish to make is that when it comes to public service, like railroad transportation, we can go right to the end we aim at and fix the prices. It is entirely competent for the State legislature and for Congress by direct legislation to say how much any carrier shall charge on any commodity or between any places. Of course that power is subject to the same limitations which is put by the Constitution on all legislation, that no man's property shall be taken without due process of law and that every man shall have the equal protection of the laws. But under these limitations the power of Congress over interstate, and State legislatures over State traffic is plenary and exclusive. Therefore the objections to the railway combinations

Q. That involves the question whether or not it is a proper thing for the governments to exercise supervision over this matter of increasing capital stock unnecessarily or watering stock.—A. It would seem to me the very reason that applies to supervision over banks would apply to railroad corporations.

Q. (By Mr. FARQUHAR.) You have frequently said in your testimony that competition is the cause of discriminations.—A. Yes.

Q. And evidently to eliminate this competition there ought to have been an arrangement between the railroads so as to get uniform rates? That is, you would leave it to the railroads themselves whether by pooling or otherwise, to have uniform rates prepared for all? In other words, you would give contract power to the railroads themselves so that there could not possibly be any of this free competition or antagonism of roads in getting customers?—A. Substantially that. I would give to the carriers certain rights of contract with each other which are now denied and prohibited, but on condition that the public be protected against abuse of that privilege by such contemporaneous legislation as would give public authority ample power to control any abuses which might result from that combination.

Q. Now, were it possible to make practicable the proposition which is quite general in this country, of the Government ownership of all railroads, do you not think that that would solve the whole question of discrimination and regulation, by having the whole of those roads in the hands of public servants?—A. I will answer a part of your question first. I do not think it would at all stop discriminations, and to my mind that is one of the most serious objections to Government ownership of railroads; I mean as a present solution of the railroad question. Undeniably, under Government ownership this individual discrimination would disappear; the published rate would be observed; but the discriminations which might most grievously result from an unfair adjustment of public tariffs, as between communities and between commodities, might increase, intensified by the political control or influences which would be brought to bear upon that situation. I am so little disposed to say anything that should look like favoring Government ownership that if I thought it necessary I would say everything against it, and I feel very strongly on that precise point. Under Government ownership you would, of course, get rid of this private concession, but how would you see to it that rates were fairly adjusted so that the produce of this great country would circulate freely and in natural volume in different directions? How would you prevent political control, if I may so express myself, of rates which themselves would produce the most intolerable discrimination in favor of communities or sections of the country?

Q. Do you think there is any danger, when you speak of political control in the ownership of railroads, when you take into consideration the fact that the 800,000 employees of this country might possibly take one side of the political question?—A. That is so obvious an objection that it does not seem to me to need any comment.

WASHINGTON, D. C., October 5, 1899.

TESTIMONY OF HON. CHARLES A. PROUTY,

Member Interstate Commerce Commission.

The commission met at 2.15 p. m., Vice-Chairman Phillips presiding. At 3.30 Mr. Phillips introduced Hon. Charles A. Prouty, of Vermont, one of the members of the Interstate Commerce Commission, who, being first duly sworn, testified as follows:

Q. (By Senator MALLORY.) I will say to you, Judge Prouty, as I did to Mr. Knapp, that I would much prefer that you proceed on your own motion as to those points that you prefer to discuss.—A. Well, I have not any particular thing that I care to say to the commission. The chairman this morning covered the ground substantially, I think. If there is any point about which any member of the commission would like to interrogate me I shall be happy to answer that question.

Q. There is a point that I intended to refer to this morning in Mr. Knapp's testimony, which I omitted, and which I would like very much that you would devote some attention to, and that is embodied in topic 34 of the topical plan of inquiry on transportation—"Rates on imports and exports from and to the seaboard; in what do they differ from the rates on domestic products and commodities from and to the seaboard; if they are less, for what reason, and what is the effect on such difference?"—A. I have no particular knowledge and can make no particular statement

as to the rates on imports. I know that in many cases rates from the seaboard to the point of consumption are very much less than in cases of corresponding domestic articles. The rates from Liverpool to San Francisco through New Orleans are not more than one-half on a great many articles what the rates from New Orleans to San Francisco are; but since I have been a member of the commission that subject has not been especially under consideration and I have no special knowledge about it. We have very recently investigated the question of export rates on grain and grain products, and, as the chairman stated, I prepared the opinion of the commission in that case. That does not give me any greater acquaintance with the subject than the other members of the commission have, although perhaps it ought to be, but I do not think it is, somewhat fresher in my mind for that reason. There were three points involved in that investigation: First, the comparative rate on grain from interior points to the seaboard, to New York, for instance, when intended for domestic consumption and when intended for export; second, the comparative rate on wheat and flour; and third, the publication of tariffs. The railroads have always claimed that they were under no obligation to publish their tariffs when the traffic was for export. That was entirely without the purview of the law. And we investigated that, among other things, and held that they were under the same obligation to publish schedule rates in case of export traffic that they were in the case of domestic traffic. Now, in reference to the relative rate on grain when for export and when for domestic consumption, we found this condition. I may get these rates wrong, because it has been some time since I looked into it particularly, but, generally speaking, the rate on wheat from Kansas City to Galveston, if that wheat was to be ground at Galveston and eaten up in Texas, was 27 cents a hundred pounds. The rate on wheat, if that wheat was to be exported from Galveston, taken over to Liverpool, and ground in England, was 10 cents a hundred pounds. The rate on wheat from the Mississippi River to New York, if that wheat was to be ground and eaten in New York, was about 20 or 21 cents a hundred pounds. If it was to be taken over to the other side and ground, it was 12½ or 13 cents a hundred pounds. That is to say, we found that the railroads were sometimes charging twice as much when the wheat was to be used at home as they did if the wheat or corn—for corn came into the investigation—was to be used abroad. Now, the railways said that that was necessary to meet market conditions abroad; that is to say, we could not sell our corn and wheat abroad unless they put in a lower rate which carried it abroad. Upon investigation it turned out to the satisfaction of everybody, and was admitted by the railroad companies themselves, that this was not true; that, looking merely at those rates which we had under investigation, there were no market conditions abroad which required charging a less rate on export than on domestic traffic. The rate had been charged entirely for the reason that our carriers were competing among themselves at home. Now, that being so, the low rate which was made on export traffic could not have benefited the American farmer. It benefited entirely the foreigner who ate the grain and who used the corn or the wheat. If the price is fixed in our country the farmer gets so much here anyhow; and of course, if the freight rate is low, the foreigner pays the price here plus the freight rate. On the other hand, if the price is fixed in a foreign country, then the farmer here gets the price abroad minus the freight rate, because he gets the benefit of the freight rates. We were satisfied, and the railroads admitted, that there were no market conditions which required this low rate; and it came to just this, that our railroads in the last year, under those low rates, because of their carrying the enormous amount of traffic along these lines, had been making a gratuitous present to foreigners of probably millions and millions of dollars which ought to have gone either into their own treasuries, or, if they did not need it, the American ought to have had the benefit of it in the way of a lower rate. While that was true, and while the railroads admitted it was, we had no power to stop it, and we were obliged to say that we could not undertake, with the power that the commission has, to prevent that discrimination. The question is complicated by water competition. This corn or wheat comes to Chicago, and it can go by water all the way from Chicago to Montreal, and can go by water all the way to New York, and that, of course, fixes the rate to Montreal and New York, and fixes the rate to every port through which it is exported; and that was one reason why, perhaps, we thought we ought not to interfere in that matter.

In reference to the flour rate, we found that the Chicago miller had paid about 21 cents a hundred pounds to get his wheat and flour, either in the shape of wheat or flour, to New York; that the English miller could take his wheat to New York for 13 cents. There was a clear discrimination, depending somewhat on the point of origin, but a clear discrimination of about 8 cents a hundred pounds in favor of the English miller. The testimony showed that on export flour a profit of from 2 to 3 cents a hundred pounds was regarded as a pretty good one by our millers, and of

course our millers could not grind for the export market in the face of a discrimination of 8 cents, when all the profit they normally made was 5 cents. In that case we thought we should attempt to grant some relief, although our ability to do so was doubtful. We directed that the rate on flour should not exceed the rate on wheat by more than 2 cents a hundred pounds.

Q. Did you investigate at all as to the character of the rates, whether it was a paying rate for Galveston, that you were speaking of?—A. Twenty-seven cents and 10 cents.

Q. Did you inquire whether it was a paying rate really to the railroads, or whether it was a losing rate?—A. Yes, we inquired about that, but nobody can tell. Here is a railroad, here is the motive power, here are the cars; you must pay your fixed charges anyway. No man can tell whether it is good business or not good business to haul that stuff from Kansas City down to Galveston for 10 cents a hundred pounds; but it is only 900 miles from Kansas City to Galveston; it is 1,200 miles from the Mississippi River to New York. If it is good business to haul grain from the Mississippi River to New York for 12½ cents a hundred pounds, we certainly can not say that there may not be some money in hauling grain from Kansas City to Galveston at 10 cents.

Q. If that was a reasonable rate, the other rate must have been very extravagant?—A. That is the question. On all these Texas lines the percentage of operating expenses is very large, usually 90 per cent. The local traffic is light, and the through traffic is light. They must keep up their roads whether they carry the through traffic or not. We all felt that there was a grave inconsistency in these two rates and that the difference was altogether too wide, but we could not see how we had the power to remedy the difficulty.

Q. As I understood, you did not interfere with the Galveston rate?—A. No, we did not interfere with it; did not think we could. If the road carried any export business, the rate must be the same through Galveston as it is through New York. But the ocean rate from Galveston is high. The rate to New York was 12 cents, and the Galveston rate had to be as low as 10 cents or they could not do any business.

Q. Then the real reason, as you state, for that discrimination between rates for export and domestic consumption is competition to the seaboard by water?—A. No; the real reason is competition between carriers to the seaboard; that is what makes the low rate. Of course, the competition is between the point of origin and the point of destination; between, we will say, Chicago on the west and Liverpool on the east. The rate to Liverpool is made up of the freight rate to New York or somewhere else and the ocean rate to Liverpool. Now, the ocean rate to Liverpool is lower from New York than it is from Galveston. Therefore the freight rate to Galveston must be lower than the freight rate to New York.

Q. (By Mr. A. L. HARRIS.) I would like to ask whether or not the price of wheat in the foreign market had anything to do with the freight rate?—A. So far as we could learn, the price in the foreign market had not produced the slightest effect on freight rates; and, so far as we could learn, the freight rate did not produce any effect on the amount of grain sold in the foreign market. There might be conditions where it would, but the period which we investigated did not develop any of those conditions.

Q. (By Senator MALLORY.) This morning we had a very interesting statement from Mr. Knapp on the subject of discriminations. Is there anything that you would care to suggest in connection with that subject in addition to what he said?—A. No; I do not think that there is. The more you gentlemen look into it the more you will decide that the most important subject which you have to consider, or which can be considered in connection with the industrial operations of the country, is the freight rate. I do not think there is anything to-day which so contributes to build up the trusts and monopolies of this country, which you gentlemen are investigating, as the freight rate. I am not talking about this epidemic of combinations that is sweeping over this country now, which embraces a great many subjects into which the freight rate does not enter; but I do not believe that there is a great trust to-day anywhere—that is to say, in any one of the staple commodities handled in this country—which could have established or maintained itself in the face of absolute equality of the freight rate. I do not mean by that that every monopoly has a rebate. I do not mean by that that every monopoly enjoys some concessions in the rate; but I mean if you would strip these great combinations of all dominion over, and of all participation in, the making of the freight rate, not one of them would be a very dangerous element in our social polity.

Most people do not have the slightest appreciation how important a thing a slight change in the freight rate is. Some time ago the railroads centering in Chicago imposed a terminal charge on all cars of live stock shipped into Chicago. The Chi-

as to the rates on imports. I know that in many cases rates from the seaboard to the point of consumption are very much less than in cases of corresponding domestic articles. The rates from Liverpool to San Francisco through New Orleans are not more than one-half on a great many articles what the rates from New Orleans to San Francisco are; but since I have been a member of the commission that subject has not been especially under consideration and I have no special knowledge about it. We have very recently investigated the question of export rates on grain and grain products, and, as the chairman stated, I prepared the opinion of the commission in that case. That does not give me any greater acquaintance with the subject than the other members of the commission have, although perhaps it ought to be, but I do not think it is, somewhat fresher in my mind for that reason. There were three points involved in that investigation: First, the comparative rate on grain from interior points to the seaboard, to New York, for instance, when intended for domestic consumption and when intended for export; second, the comparative rate on wheat and flour; and third, the publication of tariffs. The railroads have always claimed that they were under no obligation to publish their tariffs when the traffic was for export. That was entirely without the purview of the law. And we investigated that, among other things, and held that they were under the same obligation to publish schedule rates in case of export traffic that they were in the case of domestic traffic. Now, in reference to the relative rate on grain when for export and when for domestic consumption, we found this condition. I may get these rates wrong, because it has been some time since I looked into it particularly, but, generally speaking, the rate on wheat from Kansas City to Galveston, if that wheat was to be ground at Galveston and eaten up in Texas, was 27 cents a hundred pounds. The rate on wheat, if that wheat was to be exported from Galveston, taken over to Liverpool, and ground in England, was 10 cents a hundred pounds. The rate on wheat from the Mississippi River to New York, if that wheat was to be ground and eaten in New York, was about 20 or 21 cents a hundred pounds. If it was to be taken over to the other side and ground, it was 12½ or 13 cents a hundred pounds. That is to say, we found that the railroads were sometimes charging twice as much when the wheat was to be used at home as they did if the wheat or corn—for corn came into the investigation—was to be used abroad. Now, the railways said that that was necessary to meet market conditions abroad; that is to say, we could not sell our corn and wheat abroad unless they put in a lower rate which carried it abroad. Upon investigation it turned out to the satisfaction of everybody, and was admitted by the railroad companies themselves, that this was not true; that, looking merely at those rates which we had under investigation, there were no market conditions abroad which required charging a less rate on export than on domestic traffic. The rate had been charged entirely for the reason that our carriers were competing among themselves at home. Now, that being so, the low rate which was made on export traffic could not have benefited the American farmer. It benefited entirely the foreigner who ate the grain and who used the corn or the wheat. If the price is fixed in our country the farmer gets so much here anyhow; and of course, if the freight rate is low, the foreigner pays the price here plus the freight rate. On the other hand, if the price is fixed in a foreign country, then the farmer here gets the price abroad minus the freight rate, because he gets the benefit of the freight rates. We were satisfied, and the railroads admitted, that there were no market conditions which required this low rate; and it came to just this, that our railroads in the last year, under those low rates, because of their carrying the enormous amount of traffic along these lines, had been making a gratuitous present to foreigners of probably millions and millions of dollars which ought to have gone either into their own treasuries, or, if they did not need it, the American ought to have had the benefit of it in the way of a lower rate. While that was true, and while the railroads admitted it was, we had no power to stop it, and we were obliged to say that we could not undertake, with the power that the commission has, to prevent that discrimination. The question is complicated by water competition. This corn or wheat comes to Chicago, and it can go by water all the way from Chicago to Montreal, and can go by water all the way to New York, and that, of course, fixes the rate to Montreal and New York, and fixes the rate to every port through which it is exported; and that was one reason why, perhaps, we thought we ought not to interfere in that matter.

In reference to the flour rate, we found that the Chicago miller had paid about 21 cents a hundred pounds to get his wheat and flour, either in the shape of wheat or flour, to New York; that the English miller could take his wheat to New York for 13 cents. There was a clear discrimination, depending somewhat on the point of origin, but a clear discrimination of about 8 cents a hundred pounds in favor of the English miller. The testimony showed that on export flour a profit of from 2 to 3 cents a hundred pounds was regarded as a pretty good one by our millers, and of

I have already said that it is not only the rebate, it is not only that sort of a discrimination which operates to the advantage of these monopolies. It has been said that the Standard Oil Company does not to-day pay or take any rebates. We all know what the history of that company was to begin with, but everybody else took rebates then and I suppose the Standard Oil was fortunate in being able to get twice what anybody else did. But they say that since 1887, since this law went into effect, they have not received any rebates. Assume for a minute that they have not, that is not all there is to it. It is not only by the payment of a rebate that you manipulate a freight rate. For the purpose of illustrating what I mean, I will take New Haven territory. That is up in my country and I know about it. Take the territory which is controlled by the New York, New Haven and Hartford Railroad to-day; that is, the whole State of Connecticut practically, part of Massachusetts, and part of Rhode Island. What is the condition of things there? We find this significant fact: In 1887, when this interstate-commerce law went into effect and the freight rate was first published, the rate from Cleveland, where a good deal of oil is refined, to Boston, on grain and grain products—if I get the figures right, it is a year or such a matter since I have looked at them—was 22 cents a hundred pounds; the rate on petroleum was 22 cents a hundred pounds; the rate on iron articles was 22 cents a hundred pounds; to-day the rate on grain is probably 15 cents a hundred pounds; the rate on iron articles is 20 cents a hundred pounds; the rate of petroleum from Cleveland to Boston is 24 cents a hundred. While the freight rate generally has declined, while the rate on every other article has declined, we find that the rate on petroleum has gone up. That is a very significant fact when you remember that the cost of transportation is less to-day than it was in 1887.

You come to another peculiar fact: On almost every commodity which you can ship from the West into New Haven territory there is a through rate from Chicago, Cleveland, and everywhere else to these different points. In the case of petroleum and its products there is no through rate. When you reach New Haven territory you strike a Chinese wall, and you can not get beyond that wall with a carload of petroleum unless you pay the local rate over the New Haven road to the destination. That is another significant fact, that while every other commodity takes a through rate into that territory, petroleum pays the local rate. Now, how is the petroleum business done in New Haven territory? The Standard Oil Company owns large receiving facilities at East Boston, and I am told it refines its commodity at seaboard points and transports it largely by tank boats to Boston. From Boston it distributes it through interior territory. Independent refiners at Cleveland and at other points in the West say the freight rate is such that they are unable to enter that territory in competition with the Standard Oil Company. If they had the through rate of 24 cents from Cleveland into that territory they might; but when you add to that rate the local rate of 10 to 20 cents, they can not do it. But suppose they could, here is another significant fact: The New Haven road says petroleum and its products shall be second class unless the party to whom it is shipped has a private siding or tank opposite the rails into which he can pump that petroleum, and in that case it is fifth class. Now, the Standard Oil Company has these tanks and private sidings all over this interior territory. The person without these facilities pays second class, and the person with these facilities pays fifth class. The fifth-class rate between Boston and New Haven is probably 10 cents a hundred pounds; it was about a year ago; and the second-class rate is probably 20 cents, a difference of 10 cents a hundred pounds. While, therefore, the Standard Oil Company does pay the published rate—it has gotten above the point of taking a rebate—it can make a rate, and the manipulation of these rates is just as effective to keep the independent people out of that territory as the payment of a rebate, and more so.

I will give you another instance, and that is the rate from Cleveland to New Orleans. The Standard people have some refineries at Cleveland, and there are a great many independent refineries at Cleveland; the Standard Company has also large refineries at Whiting, just out of Chicago, and theirs is the only company that has refineries at that point. There is a general relation of rates from Cleveland and Chicago to New Orleans. I had brought together the rates on about 25 articles, which pay substantially the same rates as petroleum ordinarily, and I find the Cleveland rate is about 2 cents higher than the Chicago rate on iron articles, acids, and everything of that grade. It costs about 2 cents more to send from Cleveland to New Orleans than from Chicago. Linseed oil took a rate of 16 cents from Chicago and 28 cents from Cleveland; but when you strike petroleum you find that whereas the rate from Cleveland to New Orleans is 31 cents, the rate from Chicago is 23 cents. Now, the independent refiner at Cleveland pays the 31 cents, and the only person who gets the benefit of the 23-cent rate is the Standard Oil people at Whiting.

That is the way in which the independent refiners claim the Standard Oil people

manipulate rates to-day. Now, I do not think the property of the Standard Oil Company is not entitled to as much respect as the property of individuals; I do not believe any legislation against that company which is in any sense unjust would be wise or redound to the benefit of the country; but I do think the avenues of commerce, the arteries through which the lifeblood of this country circulates, should be unimpeded. I think the humblest shipper should have the same rates as the mightiest monopoly, and there ought to be some power to see that that is so.

Q. (By Senator MALLORY.) Have you any idea what influence it is that enables the Standard Oil Company to get such concessions as evidently it has in these rates?—

A. Exactly the same influence which produces every discrimination—the interest of the party offering the discrimination somewhere, I suppose. In the case of the New Haven road, it is apparent. The New Haven road can make more money by transporting on a local than on a through rate. You ask me why the New Haven road does not adopt the same policy with reference to all commodities. Because the people of Connecticut, if they were compelled to pay a local rate on everything they use, eat, and wear, would send to the Capitol some Senators and Representatives who would endeavor to enact a law which would stop it; whereas they will get along with one or two commodities.

Q. Have you any suggestion as to a practical, expeditious remedy for such an evil as that, conceding it exists?—A. Of course I do not say it is an evil; I do not say it is an unjust discrimination. I state the facts as they appear. But assuming that this is an unjust discrimination against other commodities; that all commodities in New Haven territory ought to be treated alike; assuming all commodities ought to be carried on the through rate into New Haven territory, the only remedy is to endow somebody with the power to compel the New Haven road to make such a rate. There is no such power anywhere now.

Q. It is within the power of Congress to vest that power in somebody?—A. Undoubtedly.

Q. (By Mr. PHILLIPS.) Have you any knowledge that discriminating rates obtained up to the beginning of, say, 1896?—A. My knowledge on that subject would be twofold. In the first place, I should judge from complaints made to the commission and from investigations which the commission undertook. I was at Portland, for instance. We undertook an investigation there as to freight rates, and it turned out that every road running from Chicago west had an agent in Portland; and when any man wanted to ship anything from Chicago to Portland, he telephoned around to these agents and got the best rate he could, and the stuff was billed at the published rate, and he was afterwards paid the difference between the published rate and that rate. I make the same inference, from what railroad men tell me. They say a good many things to us in confidence that they do not say when they get onto the stand, and many things which we would not care to repeat to anybody else. While I am not at liberty to call any names, I have no doubt that during 1898 the demoralization of rates was about as bad as it could be. Competitive traffic did not pretend to move on the published rate. There was a paper in Chicago which quoted the actual rate just as the price of wheat is quoted. I am not so optimistic as my brother Knapp about the present condition. I would not like to say they are in all cases maintained, being under oath. I do not believe they are. They had a meeting in New York the other day to restore rates. I do not know just what that was for if rates are being maintained.

Q. (By Mr. A. L. HARRIS.) I hold in my hand the report of the commission of 1897. Amendments are recommended and written out in full. Have you any recommendations since 1897 as to amendments?—A. I think not.

Q. Are these amendments at the present time all you would suggest as a relief?—A. No; these amendments omitted provision for what I think is one of the most essential things. The commission has no power at all to establish a through rate. The transportation business of this country is done almost entirely on rates which are combinations of rates between different railroads. You can not control these rates; you can not handle these rates unless you have power to establish a through rate. But with that addition I think they do contain substantially all the amendments that might be desirable.

Q. That bill was introduced?—A. It was known as the Cullom bill.

Q. (By Mr. CLARKE.) You heard the testimony of Judge Knapp in favor of the freedom of contract between railroad companies; in other words, freedom to pool?—A. I did.

Q. Do you agree with that?—A. As the law stands now, I do not; as the law might stand, I do.

Q. How would you have it stand?—A. When it is possible for some tribunal to effectively control the rate, then I think railroad companies might safely be allowed to pool. So long as you treat transportation as a private concern, so long as the rail-

ways are given the right to make their own rates independent of all effective control, I do not think they ought to have the right to combine. At the same time I believe, we must change our ideas on that subject. We must treat railroads as monopolies, and we must regulate them as monopolies.

Q. You are familiar with the subject of transit in bond across Canada, I suppose?—A. To a certain extent.

Q. Is it your understanding that the trunk lines are opposed to that privilege of allowing Canadian roads to make a differential?—A. What do you mean by trunk lines?

Q. I mean American trunk lines, wholly in this country.—A. I take it that those that do not participate in this traffic are opposed to it, and perhaps most of those that do would be in favor of it. The Grand Trunk road brings large quantities of that traffic down to the border at Niagara and passes it over to its various connections; and these connections, some of them, could not live for a month without it. I take it they would favor the practice, and the line that is independent of it would probably be opposed to it.

Q. If they had this freedom of contract how do you think it would affect the transit in bond?—A. Not at all.

Q. It would be continued the same as it is now, you think, substantially?—A. I think so. You understand the freedom of contract does not mean the railroad company is obliged to contract. It simply means they can contract. There is no way of making a man contract unless he wants to.

Q. (By Mr. A. L. HARRIS.) What action, if any, has Congress taken on the recommendation made by the Interstate Commerce Commission with reference to the law?—A. Senator Cullom has introduced a bill. There were one or two hearings before the Senate committee which nobody on the part of the Senate attended, if I remember; and I think that is the extent of the action. I do not know it, and I do not say it, but it is said that no action can be taken on an interstate-commerce law until the railroads consent to it.

Q. (By Senator MALLORY.) By the Interstate Commerce Commission or by Congress?—A. By Congress.

Q. Have you given any consideration to the point that Mr. Knapp referred to this morning in answer to the question of the commission concerning the advisability of the Government exercising the right of inspecting the books?—A. I think they ought to. I do not think there is any one thing which would so tend to stop the payment of rebates of various forms as that would.

Q. Just the mere thought that they are subject to inspection?—A. If some of the Government officials had the power to step into the office of a railroad company and examine their books, and they were required to keep books in a specified form, it would be very difficult to pay rebates. In January, 1899, the railroad companies began to maintain rates. I said to a railroad president, about the middle of January, "How does your road show in comparison with what it was before?" He said, "For January and February we do not expect any improvement, because we have to pay our former rebates out of January and February, but after that it begins to show." These rebates which the railroad companies paid were very serious things; they amounted to very large sums of money.

Q. Some enactment separate and distinct from the interstate-commerce act, establishing a corps of officials under the supervision of some department, and giving them the same powers that are possessed now by bank examiners, say, if carried out would have a great effect, in your judgment, in preventing and stopping discriminations in the shape of rebates, etc.?—A. I think it must, inevitably.

Q. (By Mr. FARGUHAN.) What have you to say about these private cars owned by shippers? What advantages do these shippers gain over the men that use the ordinary equipments of the road?—A. That, as Lord Dundreary said, is one of the things that no fellow can find out. That is one of the unfortunate things about it, and you can see to some extent how they are used. A packer owns a car; he gets on that car a certain mileage; if he can send it from Chicago to New York by a road that is 1,200 miles long, he gets so much more mileage than by sending over another road 918 miles long. There is an inducement to send it by the long haul. He never loads that car to the maximum weight, because he wants to get as much car mileage as he can. It is expensive to the railroads, unfair, and perhaps the most fruitful source of discrimination.

Q. What class of products are these cars chiefly used for?—A. I suppose more of them are used for transporting fresh beef and packing-house products than for any other purpose; but they are used, of course, for transporting live stock and fresh fruit from California east. I think in case of these cars they are generally used by some fruit association rather than by the shipper.

Q. We have in existence what are called the Red Line and Blue Line, the

Despatch, etc. What privileges have they over the general equipment of the road?—A. It is generally understood that these lines have no privileges. They are simply an association of railroads for the purpose of transporting freight; but there is one line which operates over the New York Central, an incorporated company, which receives, say, 10 per cent of the freight money for collecting and delivering to the railroad company the freight.

Q. Is it or is it not a fact generally understood, at least, that these lines are really a part of the railroads themselves?—A. They are simply an organization.

Q. And they just simply are an advertising feature of fast freight or something to gain business. Now, in the case of roads under receivers, do such roads participate in the deliberations of these traffic associations?—A. I think so. I understand they do. I do not want to say that, but my understanding is they do.

Q. Have the shippers any more privileges under a receivership than under an orderly managed road?—A. Until recently it has been understood that the roads in the hands of receivers were the worst violators of the law to be found anywhere, but recently, about the beginning of this year, some of the courts turned over a new leaf, and I do not think that has been so since. I think the courts came to the conclusion that this law must be obeyed, and notified the receivers to that effect.

Q. Was it not usually the instruction from the court that the receiver had the authority to make the rates to suit himself and get all the traffic on the road he could for the benefit of the stockholders and creditors of the road?—A. I do not know what the instructions were. I know what they were supposed to do.

Q. Was not that practically the result in the case of receivers?—A. I think that was the result, as a rule.

Q. And were these not placed in the hands of a receiver more for the purpose of reorganization?—A. The result is usually a reorganization. They usually go into the hands of a receiver because they can not pay their fixed charges.

Q. Now, is it not a fact in railroad management in this country, that a good deal of this cutting, rebating, and rate wars, and everything else has resulted from mismanagement; that the roads are not able to run as long as they cut rates to get traffic?—A. I do not know exactly what you mean. There are some roads undoubtedly that can not get what they think is their part of the traffic, unless they cut the rate, and they cut it for the purpose of getting that traffic. Whether that is mismanagement or not would depend.

Q. Suppose they were under the agreement of the traffic association or anything of that kind, and they did not get sufficient traffic, on a road that would not draw traffic itself. Is it not a fact that a good deal of the cut rates come from these roads? Is it not the poverty of the road that will make it cut?—A. That is my understanding; but I do not know it.

Q. It is not dishonesty, but poverty?—A. It is not dishonesty which induces a road to cut; but it is dishonesty to cut. I do not think the railroads want to cut the rate because they like to be dishonest, but they have to.

Q. In prorating in a pooling organization, has it not been the custom on American roads to cut rates privately and quietly so as to get all the traffic that they can get for the pro rata when it comes to a pool division?—A. That is said to be so; that they all do it, whether weak or strong. They all want to establish the fact that the traffic belongs to them, so that when they make up the pool they can say they ought to have it.

Q. (By Professor JOHNSON.) In regard to the insolvency of roads it has been stated by some persons that it would be a good thing to establish a special tribunal consisting of specialists, which tribunal should look after the management of insolvent roads; what are your views on that?—A. I have never given the subject any consideration and have no views about it.

Q. Do you favor the supervision by your commission of the business of express and telegraph companies?—A. I do not see any reason why a telegraph company should be subjected to the supervision of our commission. I can see why an express company should be, perhaps, but I do not think any substantial complaint exists in this country about treatment by express companies.

Q. I understand it is claimed that telegraph rates are unnecessarily high. Do you see any reason why your commission is not the best authority that the supervision of the telegraph companies ought to be placed under?—A. I think that if we had the power to do what we are supposed to do now, we would have all that we could attend to.

Q. If the business of the telegraph companies is to be supervised, into whose charge should the business be put?—A. That comes more nearly the Post-Office Department than the railroad department. Perhaps you could supervise it under the Post-Office Department.

Q. (By Mr. FAIRHAR.) Do you care to state your opinion on the abuses of the pass system?—A. I do not think the abuses of the pass system as it exists to-day are

as great as Chairman Knapp stated. That is, I do not believe that the revenues of the roads are depleted to that amount; but I do think that every man ought to pay his fare, and if you want me to suggest a remedy, all you have to do is to require the railroads to publish, and file with the Interstate Commerce Commission, or put somewhere, a list of every pass they issue, and let every man who wants to, look at it.

Q. You think an amendment of the interstate-commerce law covering that feature would remedy the whole matter?—A. If the roads obey it.

Q. Do you think the abolition of the pass system would result much in the lowering of the cash fare?—A. Perhaps not, because cash fares and freight all come together, and it might not. Fares are perhaps too high in some parts of the country now and in other parts they are low enough. I think myself we ought to have in this country some system like they have in Hungary, where a poor man who is willing to travel slowly and without the accommodations and conveniences we have now can travel cheaper. I think we ought to have some rate of that kind. Now, to-day every man pays substantially the same rate. In Canada they have a second class but they all go in first-class cars. It costs money to run a train fast. If we had some system of trains that ran slowly and carried people at a lower rate of fare it would be a good thing for the railroads and the public.

Q. You think we should have such a thing in the United States as first, second, and third class rates?—A. I do not think we could use different classes on the same train. I would advocate a difference of rates of fare on different trains.

Q. (By Mr. CLARKE.) You think railroad consolidation is on the whole beneficial?—A. I think that railroad consolidation tends to do away with discrimination. It does away with competition and to that extent prevents discrimination. Railroad consolidation in New England has proved to be a good thing, in my opinion. You know our territory is divided up there. We have the Boston and Maine and the New Haven Road. They control their own territory. I live in the Boston and Maine territory. Since the consolidation of that system our rates have been reduced; our service has been improved. New England is in my territory. I receive complaints from New England if there are any. I do not receive 1 complaint from New England where I receive 50 from the State of Ohio. At the same time the freight rate is higher in New England than almost anywhere else. The average over the country is about 8 mills a ton per mile, and in New England it is almost twice that.

Q. Suppose these great systems should be further consolidated, so that practically there would be only one system in the Eastern States, would you expect benefit or injury?—A. That would depend on the system. If the consolidation was carried out, that system would have it in its power to benefit or injure absolutely as it saw fit, as policy might dictate. Consolidation is bound to come in the United States unless something else comes first.

Q. Do you not think this tendency to consolidation makes it almost imperative that there should be supervision of these great roads?—A. Certainly I do. I do not think you can have a satisfactory railroad service until you have proper supervision. It is as much in the interest of the railroad as in the interest of the public.

WASHINGTON, D. C., October 5, 1899.

TESTIMONY OF HON. JUDSON C. CLEMENTS,

Member Interstate Commerce Commission.

The commission met at 10.40 a. m., Vice-Chairman Phillips presiding. At 2.10 p. m. Hon. Judson C. Clements, being duly sworn, testified on the subject of transportation as follows:

Q. (By Senator MALLORY.) I would like to call your attention to question No. 35 of the topical plan of inquiry on transportation, and ask if you have anything to say relating to the subject there referred to, "unreasonable and excessive rates."—A. It has frequently been asserted in recent years that there are practically no unreasonably high rates, and for proof of this it has been cited that the tendency of railroad rates for years past has been downward all the time; and while this statement is generally true, it is also a fact that rates covering large movements of property have within this same period been raised again and again. They have not always stayed down. They go down in rate wars and fierce competition and then go up again. This is not only true as shown on the tariff sheets with respect to miscellaneous freights, etc., but it is so with respect to the vast movement of grain from the West. Nevertheless, it is true as a general rule that the general result has been that rates are

lower than they have been in years past, and decidedly so; but in almost every instance of gross discrimination in rates as between the localities I think there will be found two extremes—in the one case the rates to the competitive points are perhaps lower than they might be, particularly so as compared with the local rates, or the rates to intermediate or local points, so that where you find a rate that is pressed down below what is a reasonable rate this is counteracted in unreasonable rates to the numerous intermediate local stations. To illustrate: The rates from the East and from the North to Atlanta—I take that because that is a central city in that section of the country, where a trade-center system, as we call it, prevails, of lower rates to the trade centers, regardless of distances, and higher rates to the local stations, whether they are nearer or farther, because they are noncompetitive. Take the rates, for instance, to Atlanta from the East or from any point North, and the dealer at a local station 50 miles north of Atlanta will pay the through rate to Atlanta and the local rate back to the point through which the freight to Atlanta passes; but that destined to the local station 50 miles north stops there. There is no haul beyond usually, but the charge is made for it. Not only is that charge made for the haul to Atlanta, which is not actually made, but the local rate back again is charged; and so the through rate to the given station 50 miles this side of Atlanta, for illustration, is the sum of the rate to Atlanta and the local rate back. The Atlanta rate was made, presumably, to take care of 2 terminal services, 1 where the shipment begins and 1 in Atlanta, and the local rate from Atlanta to the local station back 50 miles also is in it. In the making of that rate there was taken into consideration, presumably, the expense of the 2 terminal services for that, so that the through rate, made up by this combination, to the nearer-distance point, is much higher in the aggregate than to the farther-distance point, and yet only have the 2 terminal services actually been performed, though the rate is made up as if there were 4. All practical railroad men agree and insist upon and testify that the terminal service is one of great importance, and that it is an expensive business to them to procure and maintain their terminal stations and do the switching and all those things incident to the movement of traffic and its delivery, and particularly it is a large proportion of the expense and service with regard to a short haul of 50 miles. With 2 terminal services in it a large proportion of that charge reasonably is creditable to the terminal service, so that I think in all cases of that kind of discrimination, or in most of them, there is an unreasonably high rate to the local stations, and the effect of this system is that the rate to a point 50 miles beyond Atlanta is just the same as to that point 50 miles this side. In each case it is assumed the traffic goes to Atlanta and is then shipped to that place on a through rate, and then out again, whether back or forward at the established local. Well, I do not want to enlarge upon this question, but I think gentlemen who travel through the Southern territory, particularly where this system prevails to its greatest extent, and then travel in the middle North, Ohio, Pennsylvania, and in the trunk-line territory, official classification territory, will readily see at a glance by the most ordinary observation the effect it has upon the country generally. In one section you will see in the North the prosperous cities and prosperous towns, small stations, suburban stations, and the smaller stations between the trade centers, between Pittsburg and Philadelphia and between Pittsburg and Columbus and Cincinnati, etc. When you go to the trade-center country of the Southeast, where this system prevails, you will see a prosperous Atlanta, Nashville, Knoxville, Birmingham, and so on, the recognized trade centers of importance, but between these you pass through towns that simply exist. They are in a struggle for existence. In some cases where they are nearer these larger places the stores that were filled with goods and with people dealing with merchants, and dealing with some degree of prosperity some years ago—many of them are unoccupied; and there is a vast difference between the rate to the trade center and to the intermediate stations, small noncompetitive stations, whether nearer or farther, which must tend to establish all of the manufacturing that goes to that country in these favored cities, because the freight rate is a serious matter for consideration with respect to people who are going to invest hundreds of thousands of dollars approximately in a plant that is going to continue and that can not be moved. It is a continuing tax upon their business to pay this difference for the smaller services, and it does not seem to me that it is well for the country at large that such a condition of things as that should be induced and encouraged. Neither do I think it is a good policy on the part of railroad management, but of course they assume they know more about their business than we do. But I have said more about that than I intended to, and my object in referring to it is to insist that there are many unreasonable rates in existence on the face of the tariffs.

Q. Do you mean they are unreasonable per se, or unreasonable by reason of the rates charged the cities at terminal points?—A. I think it is undue relation that works great prejudice and disadvantage to the intermediate station, and at the same time I

think if the rates were properly adjusted it would result in the cutting down of these local rates; that they might be reduced in many instances.

Q. Well, there must be some potent cause of this regulation with respect to that Southeastern territory. Do you know what it is that has brought this state of things about?—A. Well, I have generally heard it assigned, when that system has been criticised by the commission—as it has been in numerous cases—I have generally heard it said that that territory was peculiarly situated with reference to water; that the Mississippi River and the other rivers to the Gulf and the Atlantic Ocean so surround that territory that there were so many points that could be reached by water, or partly by water, largely by water, that it necessitated a reduction, the making of low rates to these points. But that I do not think is borne out to any great degree, because the territory North, that of which I have spoken, is surrounded by a system of great lakes on the north and by the Mississippi River and Ohio River and Atlantic Ocean, the canals, and is subject to quite as many water influences, I think, as the South, except, perhaps, in winter time, when the lakes are closed.

Q. Have you had occasion to compare the local rates which prevail in that Southeastern section with the local rates which prevail in the other sections which you referred to, east of the Mississippi, north of the Ohio?—A. Well, the rates are usually lower in the North than they are in the South, both local and through. That is usually true.

Q. Then it would seem that the reason assigned does not apply to those local rates. May it apply to the terminal rates?—A. Yes. Another reason assigned for it is the sparseness of business and population. Of course, that is an influence; that is a reason in part for higher rates generally in the South, and I suppose a good reason for it is that the volume of business is not such as to support the roads on an even rate with the same kind of traffic in the North, where the volume is much greater.

Q. From your observation do you think it would be possible to arrange a different system of rates, local or intermediate, and terminal rates, for that section of the country that would give lower local rates, and at the same time not oppress the railroad?—A. Well, if the rule of the so-called fourth section, that they shall not be charged greater for a short haul than for a longer haul in the same direction, had been found to mean what it says, it would have corrected this condition of things. I do not mean an absolutely hard-and-fast rule without discrimination or relief from it under any circumstances; but as it is now, the carriers judge for themselves whether the circumstances and conditions are similar or not, and then they put in rates as they always did before. They never charged any more before the interstate-commerce law was passed for the short haul than the long one, except in the face of competition. Now they say that competition creates dissimilarity of circumstances, whether it is water competition or rail competition. Where two or more roads converge, that is rail competition, and that makes the situation dissimilar, and so changes it, and so it has been held that that may be a reason for finding these dissimilar circumstances and conditions. It has also been held that they may judge of it themselves and act upon it in the first instance, so we are right where we were before the law was passed in regard to that rule.

Q. (By Professor JOHNSON.) All that is needed to remedy the situation you depict would be an insertion in the law of a clause saying that competition between railroads shall not constitute dissimilar circumstances within the meaning of the act?—A. Yes; and to enforce it and carry it out. Of course it might work some hardship somewhere if there were no exception to it, if the so-called rule of the fourth section was made operative in all cases, unless upon showing that relief ought to be had, and then the measure of relief might be granted upon hearing. Any case could be relieved that ought to be, where there is a good showing made to prevent particular cases of hardship.

Q. (By Senator MALLORY.) Does this difference between intermediate and terminal rates exist to the same extent in any other section of the country, to your knowledge?—A. It exists to a great extent in the far West.

Q. (By Professor JOHNSON.) In the Rocky Mountain territory?—A. Yes.

Q. (By Senator MALLORY.) Does there seem to be a general complaint in that section of the country against it?—A. There is more or less complaint from that section of the country, probably more from the Southeast than from the West. We hear of it oftener.

Q. Has any remedy suggested itself to you that you would be willing to outline?—A. None further than I have intimated, and such as the commission has heretofore recommended—that is, that the so-called rule should operate and be binding on the roads except where application is made for relief, and upon hearing by the commission or some tribunal authorized to hear the facts they might allow the higher charge for the shorter haul and fix the difference.

Q. The rate would have to be fixed at the starting out. Now, somebody would have to fix those rates. Suppose the railroads fixed the rates and the local or intermediate rates were complained against, brought to the attention of the commission. The commission would then have to consider whether those rates were reasonable, in view of all conditions existing. If they held they were unreasonable or excessive, or ordered them to be reduced—I understand that your idea is that they should be reduced; now, would the railroad companies' rate board have the right to appeal from that decision of the commission?—A. As the law is now they have the right. They are not required to take any notice of it now if they dispute it, and then the burden is on the commission to enter suit and establish the lawfulness of this order and have it enforced in court.

Q. Well, as I understand, your idea is that the onus should rest upon the corporation?—A. Yes; I think it would be better. The law now states that the finding of the commission shall be prima facie evidence of the correctness of the conclusions reached; and I think that it would be no hardship on the roads if the public tribunal, impartially devoting itself to these questions, after complaint made and notice to the carrier, full hearing, and taking of all testimony and argument, reaches the conclusion that a given rate is unreasonable and unlawful, either because too high or unjustly discriminatory, that the order of the commission or other impartial tribunal ought to go into operation and effect within a reasonably short time, unless the carriers can go into court and show that order to be unlawful. In all these cases it is the rate that is complained of—that is, it is the daily, continuing, operating rate, that is charged to-day, and to-morrow, and the next day, that is affecting a man's business, that he complains of, and if it is unlawful and hurtful and ruinous to his business he should have relief from it. As it is now he may bring his complaint and have a hearing, and all parties are heard fully, and it is decided by a public tribunal not interested in the question, and that tribunal makes an order which the law says shall stand prima facie, and yet they can ignore it. The commission must then institute a suit. It is tried in the circuit court de novo; new testimony may be taken and the whole matter gone over again after a great delay; volumes of briefs are written, and it passes up, and after awhile a decision is rendered and appealed. An appeal is taken to the circuit court of appeals, and the same thing is done again, except there is no new testimony taken, of course, and then to the Supreme Court, and in the meantime 3 or 4, 5 or 6 or 7 years have gone by before the controversy is ended. Now, what individuals or communities, understanding that they have to go through all of that, subject to all of that delay, have any sort of inducement to undertake to correct an oppressive rate? And then again the circumstances may be so changed in a man's business in all these matters that it may not be a matter of any interest to him when the judgment is rendered. His business may have been destroyed at that time by oppressive discriminating rates that injured his business, building up one man, his competitor, on one side of the street, by a discriminating rate; and this thing may go on until his business is injured or destroyed. What remedy is that for a man who has rights? If he has rights as to what the rate should be, he ought to have a remedy—that is, a practical and substantial one—that will right and correct a wrong; and I do not know a better way to do it than to let the orders of the commission go into effect 30 or 40 days after their rendition, provided the railroads do not go into court and obtain an injunction against them. If on the face of it, by investigation, the court can see that the commission made an error, then it can issue a restraining order or injunction and stop it until the matter can be heard on its merits, and if nothing of that sort appears there is certainly no hardship in its going into effect. Is not that better? It may be said that would be wrong to the roads, because the order might afterwards be reversed, and the commission found to be wrong on a full hearing, and in the meantime the carrier would be wronged in the matter of what he is unable to collect. In all these matters somebody has to take chances, and as it is now what becomes of the shipper, and what does he lose during this time between the decision of the commission and the final decision of the court? He is losing all the time by these effects of an unjust rate, and is suffering that which he can not recover.

But it may be said by some that after the final decision of the court he may recover reparation or damage and get it back; but every man of the least bit of experience in these matters will know that nobody is going to get substantial relief in that way. Usually the transactions are so numerous and it takes so many suits that it would be folly to enter upon an effort of that sort.

Q. (By Mr. PHILLIPS.) Have you not frequently found against the railroads a large amount of money?—A. Not very frequently.

Q. Are there not cases now pending before the courts under which you have found a large amount of money due the shippers?—A. Yes; we have in some cases. Under

the law as it now is the commission is authorized to find and report what reparation shall be made. Now, we have ordered that in some cases, and in some cases the roads have paid it. In other cases they have resisted, and in those cases the suits are now pending in court to enforce such orders. But it is extremely injurious to a man's business which depends upon reasonable and just rates, which are affecting him from day to day, that he must wait for an accumulation of the wrongs and then bring a suit for recovery; and then the difficulty of finding what carrier shall be responsible, just how much, who shall be responsible for it, and all of the uncertainties pertaining to litigation of that sort make it an insufficient remedy for a man who has suffered an actual wrong.

Q. (By Senator MALLORY.) Is it your opinion that competition that exists now between railroads, and between railroads and water transportation, is to any extent responsible for this condition?—A. Well, undoubtedly the competition between carriers has reduced the rates to the trade centers and competitive points lower than other places, and so has water reduced them.

Q. Would the doing away of that competition, in your judgment, have a beneficial effect?—A. Well, if all the competition was done away with it would seem that there would be no particular inducement for discriminations, and it would go far to do away with discriminations; but I have always been apprehensive that it would have a different effect in respect to the reasonableness of rates. All of these combinations, such as pooling and contract relations between competing carriers, their leading purpose, as I have always understood it, is to get rid of competition in order to get more money out of the business.

Q. Which would equalize rates and prevent discriminations?—A. Well, it would result in equalizing; it would do away with the temptation to discriminate.

Q. Would it reduce or would it do away with the complaint of excessive rates?—A. Well, I am afraid it would aggravate the cause of complaint as to excessive rates.

Q. Well, do you not think it would be feasible to permit the transportation companies to make pooling contracts and at the same time to put some wholesome restraints upon them that would prevent them from charging excessive rates?—A. Well, that might do; that would depend a good deal upon what the restraint was and how it was to be applied.

Q. If you could open the door for them to harmonize their rates, as you might say, automatically, among the railroads themselves, establish an equal rate and at the same time put a check upon them, so that they would not be able to charge excessive or extortionate rates, would not that do away to a great extent with much of the cause of complaint against the railroad system of this country?—A. I have no doubt it would, if that can be accomplished effectively. The difficulty has always been, to my mind, about whether that would be effected or not. If the competition was gone and there was practically one management, so that undoubtedly there would be no temptation to discriminate, as there is now by rebates and otherwise, at the same time it would be much more in their power to get more out of it than they do now—tax the public more; and every slight raise in rates makes a vast difference in the charge to the public. We give a great deal of our attention to the silver question, and the tariff question, and the internal revenue, about how the tariff shall bear and how it shall be distributed, and a good deal of money is appropriated and expended to prevent cheating in respect to imports, not only to protect the Government in getting its revenue, but also to protect the honest importers against the smugglers; lots of money is expended for that purpose, justly so and necessarily so; so in regard to the internal revenue we expend a great deal of money to suppress the moonshiner, not simply to protect the Government in getting all its revenue, but also to protect the honest distiller who is paying his tax. In other words, to prevent unjust discrimination. But here is a business which collects from the people of the United States nearly \$1,200,000,000 a year, which is more than twice as much as the Government collects out of the internal revenue and tariff put together; more than twice as much as both, and yet it is full of opportunities for discrimination between localities and individuals, tenfold more harmful than anything that can be done under the tariff laws and the internal-revenue laws to individuals and communities. The rate of freight now, I believe, is about $8\frac{1}{2}$ mills per ton per mile. An increase of about a mill and a half, which would seem to be a very small amount on a ton a mile, would make a revenue of over \$100,000,000 increase to the railroads, and all of it would come out of the public. A very slight increase, made possible by any means, however insignificant it may look when expressed in mills, means a great sum. That increase would amount in a year to more than twice as much as the dividends paid to the roads on their stock in the last year.

Q. Are not the freight rates in the United States really less than they are in any other country, on an average?—A. I do not know how that is. I have heard very

many statements about that, but I have never seen an authentic statement that was entirely satisfactory. They are less than in some countries. The investment in building roads is a great deal less than in some other countries where the freights are higher.

Q. Do you think it is feasible for a body such as the Interstate Commerce Commission, with the information and experience which that commission possesses, to establish freight rates for the country at large, for the railroads all over the United States?—A. Well, it would be a great undertaking to do it originally, in the first instance, and I should hardly say that any commission ought to be charged with such responsibility and such duty as that. I am afraid it would not be within their power to do it at one time, and yet these things are a matter of growth. I think that a commission of experts could take the present tariffs, present classification, and construct from it, by revision and hearings and consideration of these matters, within a year or two, a much better system than we have now. It would be a matter of growth, a matter of revision and correction, based upon experience and information and observation, and it would have to be brought about by a system that would not permit this constant fluctuation.

Q. Is not that very fluctuation something that, under existing conditions of railroads in this country, is almost absolutely necessary?—A. Well, you mean it is due to competition, I suppose.

Q. Yes; competition.—A. Yes; largely so.

Q. They are obliged to change those rates to meet exigencies arising out of business?—A. Yes; the suggestion I made a little while ago in regard to the long and short haul, if it was made enforceable, would go very far to correct many of these rate wars and fluctuations, in my judgment. If a road running from New York to Atlanta—taking that for an illustration now—when it reduced its rate 100 per cent in order to get freight, knew that it had to reduce all its intermediate rates down there, it would hesitate a very long time. It would be a restraint, a wholesome one, against this reckless plunging into rate wars in particular localities. But I do not wish to be understood as advising the power to be conferred on the Interstate Commerce Commission, or any other tribunal, of making all the rates for all the roads of this country. The commission has never suggested that or asked it.

Q. Yet the equalization of freight rates has, I think, presented itself to the attention of the thinking people. I do not mean to say making them exactly alike, but to equalize them as far as practicable.—A. Yes.

Q. There is no authority now in anybody to do that?—A. No.

Q. Would not that be a proper subject for careful consideration in connection with our railroad problem?—A. Yes.

Q. Of vesting that power in somebody?—A. Undoubtedly it presses itself all the time. I think there ought to be a corrective power; there ought to be revisionary power in the Interstate Commerce Commission, or some other tribunal, upon cases in controversy, where the facts are found and the conclusion reached, to correct the rate; not simply to declare the rate in existence to be bad or unlawful, but to prescribe what it shall be, not perpetually, not forever, not unchangeably, but until other conditions grow up, a showing of which, by a full hearing and fair trial, will indicate the proper change to be made. The anomaly, it seems to me, in this class of controversies is that when two people of the country have a controversy about any matter it must go to a court or public tribunal to be tried by an impartial body; but as to the rate, although the law says that it shall be reasonable and just—and every rate that is not reasonable and just is unlawful—yet a man that uses the railroad must pay it, and he can not go into any tribunal, as the law is now, that has power to make any other rate. It is true, we heard this morning of one rate that had been changed (see testimony of Hon. Martin A. Knapp, pp. 133, 134); but that was raised, it was not reduced; and I suppose that is based upon the fact that the railroad was in the hands of the court. That probably could not be done by a court any more than by the commission in respect to a road that was not run by the court. But here you are bound to submit to the unlawful rate, no matter how unlawful it may be; you are bound to submit to it if you use the railroad, or else you must submit to the determination of the railroad manager, who is a party interested in the controversy, and his determination must control.

Q. You spoke of letting the rate stand as fixed by the commission or whatever body had that power, unless the railroad or transportation company could show good ground for an injunction. I do not suppose you mean to mark that out as the only procedure?—A. No; I simply mean that I think that after the commission has deliberated on the case and both sides have been fully heard, it being an impartial body established for that purpose, its finding ought to stand until a court finds to the contrary. In other words, every litigant is entitled to his day in court, and the commis-

sion is not a court, and therefore he must have a court pass upon the rightfulness of it; he must have an opportunity and time within which to present it to the court.

Q. (By Professor JOHNSON.) Do you think that the competition among producers is a force that will prevent exorbitant rates? You have not mentioned that in your remarks thus far that I could discover.—A. Do you mean the producers of goods?

Q. Yes, the producers of commodities of any kind that seek markets and reach those markets by transportation agencies. The competition of producers in given markets, of course, is a well-known phenomenon, and some writers lay much stress on that force as being one which will prevent excessive charges, even if you give the railroad corporations the power to cooperate in rate making. I think the commission would like your views on the operation of that force.—A. Well, I do not think that that is sufficient to prevent the exaction of exorbitant rates. If there is actual competition between railroads and it is carried on, that will tend to do it very much as charges for everything else are affected where there is free and full competition.

Q. Do you think the competition among carriers with each other at the present time has a stronger effect upon rates than the competition of producers with each other?—A. Well, they are so interwoven together that it is hard to tell which has the greater force. The competition of producers would not amount to much but for the railroads, because what is produced does not get very far but for the railroads. The circle of competition between producers before there were any railroads was very limited, and these questions did not trouble the country like they do now. It is the means of communication and transportation from the places of production to the places of consumption that affect the charges in all these things, and the one is dependent upon the other.

There is just one other matter I had in mind to refer to, and that is in regard to the power of inspection. It was referred to this morning in the testimony of Chairman Knapp (p. 144). The Government has the closest scrutiny over the banks. What they do in volume is a small matter compared to what the railroads do, and the number of people they touch and affect in their business is very small in comparison to the touch that the railroads have upon the public and its business generally; and the Government does not hesitate to send one of its agents into the bank at any time, with or without notice, to look into it from beginning to end to see what transactions it is dealing in, whether or not it is injuring business, whether it is violating any law or not; and that is done in large part for the protection of the people. So, with the insurance companies the States do the same thing, and it does not seem to me that any of these things compare in magnitude or in their effect upon the people with the business of the railroad companies. Many of these secret criminal violations of law, such as rebates and the like of that, were covered up in various ways in the books and offices, when they were called claims for loss and damages, presented as such, but which were rebates pure and simple. If the officer of the Government could walk in and call for Book A and the vouchers pertaining to the entries upon it, etc., and look through it like he does in a bank, these things can be found out. As it is now, how are you going to prove it? You go and call for the books and papers from the railroad officers and they bring them down and present them to you; but who can tell about what is in them? Who can do anything with them in the sessions of a court? It requires more time; it requires detailed examination by an expert who knows about books and has days and weeks to go through them and cull out and find out these things and explain them before a court can do anything with them or act upon them. But this is usually said to be an unnecessary interference with private affairs. I do not see that there are any private affairs in respect to the management of the railroad business in regard to transportation, if the public has any rights in it at all. If it is a private business, then there ought not to be any interstate-commerce law. If it is a public service and the public is entitled to equality of treatment and has rights in the matter, then it is but reasonable that they should have the means of finding out whether they are being wronged or not.

Q. (By Senator MALLORY.) You have no doubt as to the power of Congress to enact such legislation?—A. I see no reason for any doubt about it at all. The expressions of the courts seem to ascribe to Congress the fullest power in respect to interstate commerce, so that it does not confiscate property, a limitation that applies to all acts. These secret devices are so numerous and there are so many ways of concealing them that, unless you have access to their books and papers, you can not find out much about them; and even then it would be a matter of very great difficulty; but it would be more dangerous for them to do it than it is now.

Q. (By Professor JOHNSON.) Would you not have to accompany your inspection with a prescription as to accounts—uniformity of accounts?—A. Well, I think it would become necessary to have a uniformity of bookkeeping, and the present act hints at that and contemplates coming to that end at some time; uniformity of book-

keeping and keeping of accounts so that in all offices you would find about the same class of accounts on the same books.

It seems to me another wholesome thing would be to empower and require the courts, in cases of habitual and constant practices of paying rebates and of known violations of law, such as have been going on a few years back, where there was scarcely any attempt to conceal it except the detailed evidence of it that would be necessary in a criminal court—otherwise it was generally confessed that there was a general violation of law by rebates and by reducing the rates in one way and another—in a case of that kind, where a railroad is in that practice, and it is shown to the court on an application made, I do not see any reason why the court should not be required and empowered to enjoin any officer or agent of the road, from the president down, to cease and desist from that practice. Other people are enjoined in large numbers against violations of law, and I do not see why the whole company could not be enjoined in that way. If that were done, then a given instance being presented would require somebody to go to jail for contempt.

Q. It seems to me that would be taking the enforcement of criminal law out of the hands of the ordinary judicial machinery and substituting common law for statute law?—A. Well, it would be analogous to some things that are done now to preserve order and prevent general violations of law, whether it is good policy or not. Then, again, I think there is some language in the present antitrust law about the seizure of property in movement where it is being dealt with by practices in violation of law. I do not know that any case has ever been made, but if such remedies for unjust discriminations under the interstate-commerce law were applied in respect to that as are applied in regard to the internal-revenue law and the customs law, and property that was moving in fulfillment of contracts in violation of law was subject to seizure and condemnation, then it would make the road rough and hard, and that would tend to stop it. These things might be called harsh laws, but we have them in respect to all these other matters. They are effective; nothing else seems to answer the purpose, and no mild temporizing with this matter is going to make the condition any better than it is. It is true that publicity has a good effect and tends to improve the condition even when there is no power to enforce anything, because it exposes and holds up the wrongdoing and tends to cause correction of some of the worst things brought to light from time to time. But that is never going to be sufficient of itself in my judgment.

Q. (By Mr. PHILLIPS.) Has your commission ever made inquiry to ascertain the total amount of capitalization of all the railroads in the United States?—A. Well, their annual reports to us show that.

Q. Can you summarize it so as to give approximately the whole amount of capitalization?—A. I had those figures in my mind recently, but I am not sure what they are now.

Q. I mean the capitalization, and then the amount invested.—A. I am not sure what it is, but we have it in our reports and statistics accurately and definitely; something like \$11,000,000,000, I think, is the capitalization.

Q. Have you any idea about how much actual money has been invested of this capital; can you approximate that?—A. No; I have no idea. I only know in respect to a great many of these roads that they are capitalized at least at twice as much as the original investment was. I only know that because of testimony brought into cases where they have had controversies, and the question of rates was up and the showing has been made. I do not know how many, but that has been shown at least in some cases. The commission has never had the means to ascertain what the original investments were. Many of these roads were built so long ago that I do not know of any way to ascertain that. Certainly we have not done so.

Q. Have you figures in regard to the entire bonded indebtedness of the railroads of the United States?—A. Yes.

Q. You have not that with you?—A. I do not quite remember what that is. Separate from the stock?

Q. Yes.—A. Oh, all those figures can be readily furnished you by the secretary, classified in any way you want them. They appear in our annual report.

Q. (By Senator MALLORY.) At present the chief and most conspicuous, and really probably the only material, source of complaint against our railroad transportation companies arises out of this question of discriminations?—A. That is far the greater cause of complaint.

Q. Of course, there are cases, as you said, of excessive rates?—A. Well, there are cases of that sort, and a good many complain of excessive rates; that is, in a good many of the complaints that come to the commission. But you can readily see that the shipper who makes complaint hardly has any means of measuring or estimating what would be a reasonable rate except by comparison; consequently in nearly all

of these complaints references are made to other rates which they think are more favorable to some other community than theirs, or on some other commodity, and so they, nearly all of them, have in them the feature of alleged discrimination; also, a good many of them, that the rates are unreasonably high. It would be difficult for shippers generally to know whether a rate was unreasonably high or not except by comparison. There is hardly anything to judge by. They do not know what a road costs; they do not know what it costs to operate it; they do not know what proportion of the business of that road is made up of the particular kind of freight that they are complaining about; and it is hardly to be expected that the people generally, the individual shippers generally, would know whether the rates they were paying were unreasonably high or not by any means they can judge them by except comparison.

Q. (By Mr. A. L. HARRIS.) I would like to ask whether or not in the first years of the Interstate Commerce Commission it was not able to make a finding and fix a rate on that finding for the future?—A. Well, it so understood it and did it for about ten years. The commission understood that was within its authority.

Q. By what power was that taken away?—A. Well, the courts decided afterwards that it never had such authority.

Q. (By Senator MALLORY.) Virtually now, the commission is bereft of almost all of the power that was originally intended?—A. Yes, that is the way we understand it.

WASHINGTON, D. C., October 6, 1899.

TESTIMONY OF MR. FRANK L. NEALL,

Shipping merchant, Philadelphia, Pa.

The commission met on Friday, October 6, 1899, Vice-Chairman Phillips presiding. Mr. Frank L. Neall appeared at 10.55 a. m., and, after having duly affirmed, testified as follows:

Q. (By Senator MALLORY.) I believe your name is Frank L. Neall?—A. Frank L. Neall.

Q. Where do you reside?—A. Philadelphia.

Q. What is your occupation?—A. Shipping merchant, steamship agent; generally interested in transportation; also some banking business.

Q. Your business then gives you more or less extended acquaintance with the inland and ocean transportation of goods in this country?—A. It does.

Q. Is there anything now connected with that business on which you would like particularly to express criticisms, as to the abuses or suggestions of amendment?—A. I can not say that there are any subjects of abuse that I would care to be heard on; but I think I have knowledge on the general subject of ocean and inland transportation, and in correspondence with your committee, or those associated with it, certain suggestions were made that I might testify to, and if it is your pleasure, I will be glad to do so.

Q. We would be very grateful to hear you on any matter that your attention has been called to.—A. I am not in the habit of addressing audiences and, therefore, after making some short statements, if the committee sees fit to direct questions, I would be glad to answer them to the best of my ability.

In correspondence with Professor Johnson, I asked him if he would indicate a few subjects or a few lines on which it would probably be agreeable for the committee to hear me, and one of the suggestions was the relations of the railways to the business of ocean transportation. They are so intimately related and interdependent that it is difficult to separate them, at least as regards the immense volume of the export and import trade of the country. Of course, that does not have any relation to the inland carriage or the portion of property conveyed for domestic consumption. The relations of the ocean and inland carrier differ very materially at some of the ports. I will instance some differences between Boston, New York, Philadelphia, Baltimore, Norfolk, and Newport News. I do not purposely exclude the Southern ports, such as Charleston, Savannah, Mobile, Pensacola, New Orleans, and Galveston, but I am not so familiar with the details of their business as I am with the more Northern ports. Our relations with the export business via Boston are almost all what you might call definite. The property goes to Boston because specified there for the purpose of being exported, very often by previously designated or definite lines of transportation. In many articles of export, for instance, they have no local market. Grain and provisions and oil cake are in certain quantities specified, and only for export.

Now, New York has immense receipts for export, and innumerable steamers visit that port seeking cargo in some respects, but most largely the regular line steamers carry the freight. I suppose New York has 4 times, even 5 times, probably, more direct regular lines of steamers plying to all parts of the world than any of the other ports mentioned. So that you bring to New York a great volume of the products of the United States and there meet the collected steamships, and they are able, to a very great extent, to arrange between themselves without any previous conference, you might say; whereas if an indefinite number of steamers were to go to Philadelphia or Baltimore, Norfolk or Newport News without the cargoes having been previously provided for them, they would be unsuccessful in securing them.

Q. They would lose a great deal of time?—A. They would lose a great deal of time, and, in the second place, they would not get it.

Q. In regard to this Boston business, as I understand, most of this product goes to Boston for the purpose of immediate shipment by water?—A. Yes.

Q. Now, unless there was some provision and arrangement to meet the possibility, it would sometimes happen, probably, that there would be a large accumulation of cargo without any vessels to carry it, unless there was some arrangement made to meet it. Now, are we to infer that every cargo is arranged for when it is shipped to Boston, that there shall be a ship to take it to Europe or wherever it may go?—A. There are substantially no tramp steamers visiting Boston. They have regular sailings averaging 30 or more per month. The dates of these steamers do not change; they sail on fixed dates. The agents of these steamers know in advance what steamers will sail in November and December and they make their previous provision for them just as you intimate.

Q. As a rule, do these vessels mostly combine passengers and freight, or are they freight vessels?—A. Substantially freight vessels. A few of them take some passengers, but they are usually what is known as freighters—Warren, Leyland, and there are other lines, with the Cunard the only one taking a few passengers. They do take largely cattle at times.

Q. (By Mr. CLARKE.) And the Dominion Line also, I suppose?—A. In the winter time I believe the Dominion Line goes from there, but in the summer time the Dominion Line goes from Montreal.

Q. I think this summer they have been running from Boston also.—A. That is quite possible.

Q. They go to Liverpool?—A. Yes. There are 21 sailing per month from the port of Boston to Liverpool, and in this particular she far outranks New York.

Q. (By Senator MALLORY.) So the shipping merchants can always count on having a ship for their cargo on a certain day?—A. Yes; that freight room is placed through the agents of the railroad. Generally they engage so many loads of wheat, corn, or oats, so many tons of oil cake, so many packages of provisions, which are to be there by a certain time.

Q. In Philadelphia are not the conditions much the same?—A. Much the same as in Boston.

Q. Not many tramp steamers go there?—A. Not for general cargo; but the bulk of our business is by tramp steamers for grain as from Baltimore, Norfolk, and Newport News. New York and Boston are the reverse; they have the regular lines which do the bulk of their trade.

Q. Now, is there any difficulty in the matter of getting ocean transportation at times like this, when, I believe, there is great demand for it?—A. It is rather excited at the present moment, owing to the British Government having taken 75 or more vessels ordinarily engaged in the trans-Atlantic trade, for carrying mules, men, etc., to Africa.

Q. Situated as Philadelphia is, with a certain large quantity of grain to ship within a given time, and her chief reliance the tramp steamer—in a case of this kind, what would they do?—A. As a rule, Philadelphia, Baltimore, Norfolk, and Newport News all look ahead for their requirements to a considerable extent. At the present time vessels are probably engaged for 7,000,000 bushels that can either load largely at Philadelphia, Baltimore, Norfolk, or Newport News, according as the parties who have chartered them eventually determine. The out-port must always have a large credit balance of tonnage chartered ahead. The immediate effect of the British Government going into the freight market has been to advance the rates of freight enormously in the last 2 weeks, in some directions 75 per cent. London freight room from New York within 3 weeks has been 3d.; yesterday 4d. was offered; and by reason of some of the London carriers having combined, they are asking even more. This has seriously affected all the tramp steamers. We have this morning the refusal of a vessel at 5s. 3d.; that same vessel would have been glad 3 weeks ago to take 2s. 6d.; that is a difference of nearly 33 per cent. As a rule, you can get your tonnage, but you must pay a higher rate by reason of these demands.

Q. Take business such as that conducted at the ports other than Boston and New York, as you have mentioned. Is there not considerable inconvenience and risk arising from the necessity of having to charter these vessels so far ahead, as to freight rates?—A. When you charter ahead to any considerable extent the chances are you are selling ahead. You are buying your corn or your wheat or your oats, and at the same time you are engaging your steamers, chartering them; and, as a rule, they are calculating to carry pretty good stocks of grain at these ports. When they can not cover themselves by the purchase of the identical delivery they want, they go into the New York market and buy an option, or the Chicago market and buy options temporarily against that grain.

Q. I was speaking with reference to the inconvenience of this method of doing business. Instead of having reliable lines so that you can count on for your shipments, you have to go out in the market sometimes, I suppose, as much as two months ahead and charter your vessels?—A. Certainly. It is an entirely separate and distinct kind of business. That is what might be called a full-cargo business versus the line-steamer business; and it is on the full-cargo business that Philadelphia, Baltimore, Norfolk, and Newport News reoup themselves and counterbalance to a considerable extent the advantages which New York has from her innumerable regular steamship lines; and the regular direct steamship lines very often go to ports that the full cargoes do not go to. The direct steamships as a rule take cargo to those specific, direct ports at a proportionately lower rate than the tramp steamer will take it there, because the direct line takes a certain amount of grain and has to sail on the regular sailing day. Then she takes oil cake, and can take the grain she requires as ballast at a lower rate than the tramp steamer will take a full cargo.

Q. (By Professor JONSSON.) I think it will be well for you to describe the manner in which the Minneapolis miller actually ships a consignment of flour from Minneapolis to Liverpool via Boston—what the arrangements really are that are made in connection with the movement of that consignment of flour to Liverpool via Boston.—A. The Minneapolis miller has, say, 50 cars of flour that he wishes to ship to Liverpool. He canvasses among the different railroad agents there—and most of them are supplied with rates of freight either via Boston, New York, Philadelphia, Baltimore, or Newport News—and he says he will have 50 cars of flour to ship in November, and he gets them to bidding on it. He says, I have the property; now, what will you take it at? One man says, I will take it at so many cents a hundred through, maybe Boston or maybe New York, or it maybe Newport News; and we will say the rate would be—I won't undertake to mention an actual rate—say, 35 cents a hundred from Minneapolis to Liverpool. One man will bid for that transaction, 35 cents; another man will come up and say, here, we want some for that steamer that sails in November and we will take it for 34 cents. So that is the cheapest rate by the differential line; that is the rate that will get that property as a rule. Then the goods are shipped in cars which are transported by the railroad to the docks at Boston or any of the other cities. It is unloaded on to the docks, where it remains until the seagoing vessel is ready to receive it, or if the vessel comes alongside that dock it is loaded directly into it. If it is necessary to lighter to her, it is transferred by lighter to the seagoing craft. It is then carried to Liverpool and delivered to the consignee specified in the original through bill of lading.

Q. What contract or relationship exists between the inland carrier and the owner of the vessel?—A. That depends on circumstances.

Q. The man in Minneapolis is able to give a rate from Minneapolis to Liverpool over 2 carriers?—A. Yes.

Q. Does that mean there has been a previous contract or agreement between the 2 carriers?—A. Generally. Very often the ocean carrier will say to the railroad, We have so much room which we can give you for November at such and such a rate. The inland carrier adds to that ocean rate the inland rate, which makes the sum at which he undertakes to handle the goods.

Q. Is there an agreement among the freight carriers of the North Atlantic to which they adhere in the matter of freight, of grain traffic, or other lines of traffic?—A. I do not think there is. You mean as to rates of the steamship lines?

Q. Yes.—A. No. There could not be. It is too varying a quantity. I have just given you that instance of the raise from 3d. to 4d. in London. They are regulated almost entirely by supply and demand, and the urgency for freight.

Q. It is a matter of open competition then?—A. Forced competition.

Q. (By Senator MALLORY.) The freight rates, as I understand, from the interior of this country to Europe, vary considerably from time to time?—A. Yes; largely by the exigency of the demand of the ocean carriers.

Q. The variation is more due to the ocean carrier than the inland carrier?—A. The ocean carriers vary frequently every day in the week, but the inland carriers comparatively seldom.

Q. The transportation charge from the interior of the country to the seaboard for export is generally staple; I mean it holds pretty much the same figure without any startling or rapid changes?—A. It has been holding at a pretty minimum figure for some years, and with the number of lines of transportation it seems unlikely that it should hereafter assume any very high figure, I should think.

Q. Is the competition between Boston, Philadelphia, New York, Baltimore, and Newport News a factor in keeping these rates at a reasonable and staple figure?—A. Yes. That is what we have to work for.

Q. (By Professor JOHNSON.) It would be a safe inference from what you said a few minutes ago that the major part of the Minneapolis flour is shipped by special contract rather than by any previously published rates of the inland carriers?—A. I do not think any considerable amount of flour is shipped away from Minneapolis unless the freight is previously arranged for. You know that used to be done to an enormous extent. Freight would be shipped through from Minneapolis and all western points and collected at New York, where they often offered very great inducements to have the freight shipped in that way, such as storage from 1 to 3 or 6 months, but as a rule now, the property, before it leaves the point of manufacture, has been contracted for very largely through to the destination.

I see another notation by Professor Johnson—"the extent to which the ocean business is subject to competition and the extent to which competition has been eliminated." The extent to which the ocean business is subject to competition is probably the broadest and widest that could be conceived of. It is nothing unusual for us to have 2 or 3 steamers offered to us from London, which is the headquarters of tonnage. These vessels would be offered for 2s. 9d. per quarter, or 3s. a quarter, from what are called picked ports, such as the northern range, which is New York, Philadelphia, Baltimore, Newport News, to certain specified ports in Europe. In the morning we get a cable, "Can not renew refusals; Argentina offering better prices; Danubian demand increasing; large eastern inquiry." So the vessel we get in America, you may say, for ocean transportation has to be taken in competition with the other foreign markets of the world. The owner sits there in his office, and does not care much whether she goes to America, Argentina, the Danube, or the East Indies. Ocean rates are subject to that kind of competition, and if we are not giving but 3s. a quarter, we must advance the rate, so that we will attract them as against the inquiries from other portions of the world. Does that measurably answer your inquiry?

Q. You might perhaps state to us what portion of the ocean transportation is taken by steamers that are contracted for in this way, and whether all regular liners are subject to this arrangement?—A. On the contrary, they are always on the alert. If they find that there are not steamers enough, as they did yesterday, or that rates are higher, the rates are advanced. They will advance their rates twice in a day if necessary. We took grain to Rotterdam early this week at 2s. 6d. a quarter; later on we took it at 2s. 9d.; yesterday, just before I came here, we took some at 3s., and refused to take more at 3s. because we feel the tendency is upward.

Q. (By Mr. CLARKE.) Right on that point I would like to inquire whether you take grain at a lower rate than flour?—A. As a rule, yes.

Q. Why is that?—A. For the reason that grain stows in about 50 cubic feet as against 60 to 65 cubic feet that flour stows in. The grain costs about 8 cents a ton to handle and to put into a ship, and flour costs 37½ cents to load and put into the ship. Grain is more economically handled; and we can take a room like this and get in it from one-fifth to one-sixth less tons of flour than corn or wheat. The flour comes in sacks and the grain in bulk.

Q. (By Senator MALLORY.) You just pour the wheat into the compartment of the ship?—A. A man goes into the bin and pushes it up into the corner and all round, and the compartment is filled; but when you put flour in there is more or less broken stowage; you can not get the ends together. When you come to the corner of a room you have room for half a bag of flour but you have not room for a whole bag, and you lose that space.

Q. (By Mr. CLARKE.) Does most of the export flour go in bags or barrels?—A. Nine-tenths of it goes in bags; only to South America, substantially, and West Indies, and to a few special points, is any flour exported in barrels.

Q. What are the bags, paper or cloth?—A. I never saw any paper; they are very largely burlap, which is imported, and then exported on a drawback; or muslin.

Q. Are you aware of the recent advance in the inland rate on export grain and flour?—A. I was present in New York at the hearing before the Interstate Commerce Commission on that subject, and I took occasion to testify—give my opinion—as to what I thought was a just and equitable difference between the two, which was that flour on ocean transportation, at least, should be not exceeding 2 to 3 cents per hundred more than grain.

Q. Well, is there any such reason appertaining to the inland transportation?—A. There is more or less difference in the cost of handling it.

Q. Is export grain as easily handled for transportation overland as export flour?—A. Well, there are special provisions made for the more economical handling of grain, by reason of the export elevators into which it is delivered upon arrival at the seaboard; and the car containing 1,000 bushels of grain is very expeditiously handled, and with very little manual labor. Every sack of flour has to be man-handled, as it were; but there were arguments used, which I think were very unjust and very unfair, in reference to flour, calculating on a much greater difference than the 2 or 3 cents which I referred to.

Q. Did your estimate of that difference cover both ocean and land transportation, or only ocean transportation?—A. Well, I am afraid I expressed myself very awkwardly a moment ago. The question I thought of, ocean transportation, was not particularly before the commission. It was on the question of inland transportation. We settle that ourselves by charging a higher rate for flour than for grain, and we have no difficulty in getting that; but my testimony was directed particularly to the inland question, and I thought the 2 or 3 cents, as an extreme, would be a full and fair difference, considering the amount of grain versus flour that you could put in a car, considering the labor involved in the loading and unloading a car, and the time that would naturally be involved in the emptying a car of grain versus one of flour.

Q. You make reference to the difference as a through shipment, say from Minneapolis to Liverpool?—A. Which would be a through shipment of flour, but there would be no through shipment of grain. There is very little grain shipped on through bills of lading. I am afraid I am not making that very clear to you.

Q. (By Mr. RATCHFORD.) Is there any variation in the cost of exporting different classes of grain?—A. You mean aboard the steamer?

Q. Yes.—A. Yes.

Q. Handling a ship?—A. Yes.

Q. What are the differences, and why?—A. When we come to stow the corn and the wheat, we pay the stevedores \$2 a thousand for it; when we come to store the oats, we pay \$3.50 a thousand, for the reason that the oats, because of their spongy character, are required to be tramped, and there is more labor involved in the stowage of them.

Q. The variation, then, is due to the loading of it?—A. The cost of handling, yes.

Q. Is there any variation in the cost of exporting the different flours and mill materials—breadstuffs?—A. Yes; a large difference. Flour is exported the cheapest of all flour-mill products, and then you have the bran and middlings, and all the various by-products. Corn meal and cornuda and all these various products are more bulky. A sack filled with flour weighs so many pounds. If you fill it with any other by-products, it does not weigh two-thirds or one-half as much, but it takes the same space, and therefore we have to raise the rate on it.

Q. (By Professor JOHNSON.) Then the rates are really determined ultimately by the space the product occupies?—A. On ocean carriage more than on inland carriage. If you fill a modern car with the legal weight of wheat, you bring it up about level with the car door; if you fill it with corn you bring it probably a foot higher, because the corn is lighter. Now, if you fill it with oats, you must put in a temporary door, and fill it nearly up to the roof. But the railroad will very often get the full maximum weight of any one of the three in there. In the steamship, however, you can not do that. Our problem is, to fill a vessel and to load her at the same time, and we must have concentrated weight largely to do that. In other words, we have a great big square bin, which is comparable to this room. Now, if we fill that with wheat weighing so many pounds, we get so many bushels; if we fill it with corn weighing 56 pounds, we get a smaller number of bushels; but if we fill it with oats weighing 36 pounds, you see what a small weight we get. It is all paid by weight. We do not care what a man puts in there, so it loads the vessel properly, and balances her and stiffens her. If the shipper will say, "I will give you so many pounds sterling freight," so long as we got the same amount of freight we would not object to that small difference in stevedoring.

Q. (By Senator MALLORY.) You said in your judgment, I believe, that 2 to 3 cents was a reasonable and fair margin between flour and wheat?—A. Between flour and heavy grains; for inland transportation I think that is fair.

Q. For inland transportation? Has that difference been considerably higher at different times?—A. Yes; I understand that the millers complain that it has been as high as 7½.

Q. I think it has been testified to here that it has been even higher than that?—

A. Yes. I heard one of the officials of the Grand Trunk at this same meeting; he said the rate ought to be 50 per cent higher. I did not agree with him at all. I

think 2½ cents is all that could be reasonably charged, and all that could be exacted or collected.

Q. Have you any idea of the reason why these exorbitant rates were charged?—A. I probably could not do better than to recite the information furnished by one of these traffic officials. An official of the Grand Trunk said it ought to be 50 per cent more. He may have had some sad experience. He may have been compelled to carry flour in cars or warehouse for 2 or 3 months at a time, and he may have had that in his mind. But for a reasonably prompt movement of both grain and flour, 2 to 2½ cents difference is all that ought to be exacted from the millers, and all that traffic can stand or actually will be paid.

Q. Can you say about what the difference is now?—A. I do not think it is more. I think competition is keeping it down to about that. For you see now, to be more exact, we are having a car famine in some lines of business. It is more a question of getting a car and asking for the rate afterwards. Generally they ask a rate and then have the car sent; now they send a car and ask for the rate afterwards.

Q. (By Mr. A. L. HARRIS.) How long has this difference in the rates existed between wheat and flour?—A. Always. The gradual tendency has been to decrease the difference.

Q. So the condition now is better for the American miller than it was in former years?—A. Yes; better. It never was less than it is, except under special circumstances, when great competition may have cut the rates.

Q. Then this difference in rates between wheat and flour in your judgment is made up in profit to the American miller, is it? He is still able to manufacture flour and ship it at a profit, as the grain dealer can ship wheat, or he can ship wheat before it is ground?—A. And if the differences are very fairly divided I think the advantage which the miller has with his by-product would enable him to pay that much more rail freight on the flour that he exports.

Q. The difference in the rate you suggest you think would not injure the American miller?—A. No; I think not. If not out of order I would like to state that I am a thorough believer in export rates on the products of the West being accorded at lower figures than are accorded domestic shipments.

Q. (By Senator MALLORY.) That is done now generally, is it not?—A. That is done. It is generally a question of locality.

Q. (By Mr. PHILLIPS.) Will you please give us your reasons therefor?—A. One of the principal reasons is that the condition of lower rates on the surplus export products of the United States operates in favor of the producer and farmer in the West as a protection, just as the United States tariff assists the eastern manufacturer in keeping out foreign goods unless they pay a heavy duty. In other words, the average export of corn, I presume, might be put down, in recent years, to 200,000,000 bushels. Wheat varies from 100,000,000 to 160,000,000 bushels, and the surplus, the export of oil cake and other articles, proportionately. Now, this surplus that the farmer has on hand must be gotten rid of. If it is not gotten rid of, or if he undertook to force that 200,000,000 bushels of corn or the 150,000,000 bushels of wheat down the mouths of the inhabitants of the United States, who are all sufficiently supplied, he would cut the price down, and very soon reduce, from necessity, the tonnage production. When that man ships out his maize or his wheat, or oil cake, or his petroleum, or whatever it may be, he meets the competition of the Argentine and the Danube and the Russias and Hungary or France, and he can only sell it, provided he is able to present a substantially good article, at about the same price as his competitors. Now, personally, I can not see what objection, for instance, the eastern producers of wheat and corn, articles of that kind, would have to conceding to the western producer the lower export rate, for the reason that if that western producer does not get rid of his surplus abroad he will come into the East and reduce the market price here by this small surplus, compared to the total production, and reduce prices to an unremunerative point.

Q. Now, you can go on with the next.—A. "The place of the American vessel owners in the business of ocean transportation. Can they compete; and if not, what is necessary to enable them to compete?" I was saying to Professor Johnson and Senator Mallory this morning that within the last few days, while having a general knowledge of the tonnage of American vessels versus that of foreign vessels, I had had occasion to examine into the subject more thoroughly, and I was simply astounded at the result. The steam tonnage of the world at the present time represents a gross tonnage of 21,000,000; sailing tonnage is represented by 7,000,000; that makes a total steam and sailing tonnage of the world, according to the last report of Lloyd's Register, of 28,000,000 tons. That refers to all the tonnage of all the vessels; that is, of sail and steam, of all the nations of the world—vessels of 100 tons and over, either steam or sail.

Q. That is gross tonnage?—A. The 21,000,000 is gross of the steamers, and the 7,000,000 is net of the sailing vessels; but taking the total as 28,000,000 tons, if you add 50 per cent to it, that would make 42,000,000 tons, and that would make, as near, I believe, as you can get to it, the carrying capacity of all vessels of all nations of the world in dead weight tons.

Q. That is ocean tonnage, is it?—A. I meant to say registered steam and sailing vessels of the world over 100 tons register or upward.

Q. Does that include lakes and rivers?—A. Lakes and rivers, oceans and everything; of every vessel that is registered or known in the world, either steam or sail, of 100 tons or over. Now, that being 28,000,000 tons, if you will add to that 50 per cent, it would make 42,000,000, and you have the capacity of all steam and sailing vessels in the world to transport in.

Q. (By Professor JOHNSON.) That represents the freight that they can actually carry?—A. Yes.

Q. If all loaded at one time?—A. Yes. Now, bearing on that subject, it would appear that the exports of the United States last year amounted to something over 30,000,000 tons of freight. That makes corn, 5,000,000 tons; wheat, 4,000,000 tons; oil, 3,500,000 tons; coal, 4,500,000 tons; cotton, 2,000,000; flour, 1,600,000, something over 30,000,000 tons that we export per annum. Now, to go back to the subject: "The place of the American vessel owners in the business of ocean transportation. Can they compete; and if not, what is necessary to enable them to compete?" I am going to make a statement now which probably will be challenged, but I believe it to be absolutely correct. There are not now available for trans-Atlantic or trans-Pacific ocean carriage vessels under the American flag, sail or steam, of less than 20 years of age, of the capacity of over 300,000 tons register. I think that the records show us accredited altogether with 2,000,000 tons register. In other words, on the Atlantic coast and Pacific coast to-day under the American flag all steam vessels and sailing vessels available and suitable to cross the Atlantic to the Continent and the United Kingdom, to cross the Pacific to Honolulu or Manila, there is only a tonnage of vessels represented of 300,000 tons gross register.

Q. How did you get your knowledge?—A. By carefully going over the American Register and Lloyd's Register and other data. I had a man at work for a part of 2 days. It was so startling that I wanted it proved, and I believe it is correct. If you can bring out that fact I think it is one of the most important features, if you will permit me to say so, that your commission could draw to the attention of the public.

Q. (By Senator MALLORY.) In making that estimate, where did you draw the line as between the vessels capable of going across the Atlantic and Pacific and those not capable of doing that? What size did you strike out on the tonnage?—A. I took the position that people are not in business generally for fun, but to make money. Now, no steamer of 1,000 tons can pretend to live in a trans-Atlantic trade. I took out sailing vessels that were 20 years old, because you would not wish to ship goods in them. They will do for long voyages, for coal and like that. Then we would say that the coastwise steamships of the United States, like the *El Sud*, etc., that are built to go around this coast, and have 5 or 6 days coal in them and probably carry 2,000 tons or 2,500 tons of cargo. I say that vessel is neither suitable, from her construction, overhang, and superstructure, to go across the Atlantic, and if she was, she could not possibly make both ends meet to go across and come back. In making that statement I have not undertaken to make a forced showing at all, but carefully eliminated all vessels of which you, as a practical man, would say, "I would not take that vessel." You would not take the Winsor steamers; you would not take the Ward liners, that go to Habana in 3½ days; you would not take the Mallory steamers that go to New Orleans and Galveston, simply because they can not stand mid-Atlantic weather with their overhang. There is not enough carrying capacity to pay the man if he gets across, he can not take enough freight to pay him for the expense. So I only took vessels of 1,000 tons or over. I know that no vessel of 1,000 tons can engage in any trans-Atlantic trade and make both ends meet. I know that as a practical steamship man, running steamers, and being conversant with them.

Q. (By Mr. PHILLIPS.) Now, we understand you that this 300,000 tons is ocean tonnage; it does not include lakes and inland rivers?—A. I would like to make that thoroughly understood. At the present date there are not American vessels available for the trans-Atlantic or trans-Pacific trade, having a united registered tonnage of 300,000 tons, that are less than 20 years of age.

Q. We understood you to state that this forty-odd millions of tons capacity embraced both ocean and inland traffic. That includes lakes and rivers of the world as well as oceans?—A. Yes.

Q. Now, can you tell how much American tonnage we have in addition to this, on the

lakes and the rivers of the United States?—A. According to records, 2,100,000 tons; but you can not get a lake steamer from the Great Lakes or any of those modern steamers through the canals; you can not get them through the canals down here. If they did come they would be knocked into smithereens by a great storm. It is so improbable that it need not be compared.

Q. (By Senator MALLORY.) Right on that point you have spoken of the impossibility of using for trans-Atlantic trade such vessels as are now engaged in the coastwise trade down to New Orleans and Galveston from New York, and the Ward line to Habana and Mexico. Some of them are large enough. Some of those vessels are 3,000 tons, and yet you seem to think they are not strong enough or capable of standing Atlantic gales, because of their peculiar build?—A. Their superstructure, their housing and so on, are such that no one would put that kind of structure on vessels that are going to make those trips.

Q. Are they all constructed with that high superstructure?—A. More or less so. They have the passenger accommodations; and even those vessels at the present time are mostly owned by the Government.

Q. Now, one of the lines, the El Sud and the El Nord, have built some vessels — —A. (Interrupting.) Yes; the Mexico and Havana have been built within the last six months.

Q. Those vessels all have superstructure and have passenger room on deck?—A. Yes.

Q. But is not that merely an incident? Can not that be removed without affecting the shipping capacity at all, making a smooth-deck ship?

The WITNESS. How much do these vessels carry?

Senator MALLORY. Some register 3,000 tons.

The WITNESS. What is the dead-weight capacity?

Senator MALLORY. Greater than that; I do not know. If they register 2,500, they probably carry 4,500 tons freight.

The WITNESS. I guess their registry is largely made up of these housings, are they not?

Senator MALLORY. Now that, of course, is excluded by the registered tonnage. The registered tonnage is much less than the actual displacement. The proportion is not quite 2 to 1, but something like that.

The WITNESS. I recognize the difference of the net register and gross register and the tonnage capacity. If you take the net register and add half to it you have the gross register, as a rule, in the trans-Atlantic trade. If you add 50 per cent to the latter you have the dead-weight capacity. That dead-weight capacity always includes coal and anything of that nature, for which you would charge 600 or 800 tons. But after you charged all of these things it would not make any difference in my statement. I allowed more leeway than that in that estimate of 300,000 tons.

Q. (By Mr. PHILLIPS.) You can take up the next question in order: "What laws, if any, do you think ought to be enacted on the part of Congress and the States in the interest of ocean transportation?" That is the question. "Can they compete; and if not, what is necessary to enable them to compete?"—A. While the ocean transportation was confined to wooden walls, we never had to ask any odds of anybody, that is, before 1860. When the tonnage of the world was contained in wooden vessels, the United States wooden walls commanded a premium over any other vessels that were on the seas, and the owners were as prosperous as you could ask them to be. After that the transition came to iron, and subsequently to steel steamers, and as strange as it may appear, for some reason or other, America has never built what might be called an ocean tramp. I think there has never been an American ocean craft or tramp of that kind built. Americans are not permitted to import or hold, substantially, foreign vessels, although probably at this time it is one of the most legitimately profitable industries in the world. The records of the British shipping show innumerable instances where within the last 10 years individuals or firms owning 1 or 2 steamers have developed their plants until to-day they own 20. All the increase in the British tonnage has very largely been made out of accretions from the returns of vessels they have managed. We have amongst our list of correspondents many people who comparatively a few years ago had 3 or 4 steamers. Now they have or represent 10 or 12, very largely made out of their profits. The United States has built up an export trade for her manufactured products which in the last 2 years has been considerably increased. It has been made possible by a character of subownership by Americans of foreign vessels. During that time there has been an innovation in transportation, practically—that is, what are designated as time charter parties. There are hundreds of vessels of that kind now chartered by British, Norwegian, German, and other owners, to Americans, and it gives the Americans for the time being—the time generally being fixed as 6 months to 2 years—it gives them the sole.

virtually the absolute control of that vessel. To give you an illustration of it: A company that we represent has a half dozen vessels at the present time owned on time charter for practically a year. We are able to control the movements of each of those vessels, virtually, as though we owned her, every dollar's worth. We have the right to send her to any port of the civilized world. If it had not been for that character of vessels, the American manufacturers would have found the greatest difficulty in getting their products out of the country, to their destinations in Europe, Asia, Africa, Japan, and Java, wherever the vessels go. Up to within a short time, if you wanted to ship, say, a cargo of locomotives to Vladivostock, or some of these out-of-the-way places, you would have to take a list of probably 50 steamers. When you would go to 1 owner, he would say, I do not want your locomotive freight; and when you would go to the next owner, he would say, That will make my vessels too late to go to China, and I do not want to take that freight; and the next man that comes along will say, I have not got large enough hatches for locomotives. Now, all you have to do is to go to the London or New York market, and you will find somebody who will take the freight either to South Africa, Australia, New Zealand, and any part of China or Manila. Simply say you want to ship so many thousand pounds of stuff, and you will find somebody who has such a time charter. A score of them will name you a rate.

Q. (By Senator MALLORY.) Does the charter of these vessels name the captain and subordinate officers?—A. A clause of the charter party is substantially this: The owner is to supply officers and crew, and engine stores, and pay ordinary consul's fees. Further than that he does absolutely nothing. He supplies the officers and crew and grubs them, as they call it, and the engine stores; then he is done. The next clause in the charter party says that if for any reason the captain or officers are unsatisfactory, or do not perform their duties to the satisfaction of the time charterers, the owners, on reasonable complaint, shall change them.

Q. Well, the owner pays the officers and crews, then?—A. The owner pays the officers and crews, and the time charterer furnishes the coal.

Q. Then the crew and master are paid European wages?—A. The crew and master are paid European wages.

Q. Which are less than American wages?—A. Somewhat less, but nothing like as great a difference as there was a few years ago. They have got wages of the men on the other side up to about £4 10s. now.

Q. (By Mr. CLARKE.) Is not the cost of keeping them a good deal less?—A. The foreign vessels are kept on a much lower range of diet than the American. You could keep them practically on the same rate; but they set a better table on the American vessels, as a rule.

Q. They eat oftener than the Americans; I understand the Norwegians eat 4 meals a day.—A. It is fish for breakfast, fish for dinner, and fish for supper, and fish soup. We have 4 vessels on time charters. The officers of those vessels are types in themselves. You do not want anything more intelligent, more interesting and more efficient in their way. And the owners are just sitting back and making 20 or 25 per cent per annum on their vessels, and it is for you gentlemen to devise some way so that America can get a chance at that kind of business.

Q. (By Professor JOHNSON.) You charter these vessels because you can not buy them?—A. We charter them. We can not get them under the American flag. Of course we would get American vessels if we could do so, but they do not exist.

Q. (By Senator MALLORY.) Have you any suggestions to make as to such legislation as will bring this about—this consummation so devoutly to be wished?—A. Well, I would like to make one suggestion in that connection, which would be to make it possible for Americans, under the most rigid restrictions from participation in coastwise trade of the United States or any trade within a few miles of it, that they should be able to own vessels that would be foreign vessels, improved vessels. I would not favor any law which would get a lot of superannuated tramps or old vessels. I would bring vessels from 2, 3, or 4 years of age. I think it would be a grand step forward for this country if she would enact such wise laws as would prevent the interference with the coastwise carrying trade, which we consider belongs especially to us, and which ought to, and which would enable American capital to seek what I consider one of the most profitable sources of investment at the present time—that is, owning what are called transient or tramp steamers, and running them in the general commerce of the world. We are excluded from that now, and the only way we can transport in one of those vessels now is by first paying the real owner 20 to 25 per cent profit, and we must make our profit on top of that.

Q. Do you know anything about the ability of shipbuilders in this country—say Philadelphia, Newport News, or elsewhere—to build iron or steel ships as cheaply as they can on the Clyde or other shipbuilding portions of the United Kingdom?—A. I know some little about it.

Q. I have seen it stated that the Cramps could build ships now as cheaply as they can on the Clyde.—A. You do not literally mean now, but within the next few years. Of course everything is going up. I do not believe you could contract in the United States for half a dozen tramps, say, of 6,000 or 7,000 tons, for delivery within the next 2 years. If you look that right in the face you have 2 years to look forward to.

Q. Is it a fact that the improvements of shipbuilding in this country have made such advances and the cheapening of the work has gone on so that we can now build them ton for ton as cheaply as the English can?—A. I do not believe anything of the kind; but I do not believe that there is the same difference that existed some time ago. I have knowledge in our business in connection with sale and purchase of vessels and correspondence with shipbuilders, and so on, of what tramp steamers, and so on, cost abroad. I cabled within the last 72 hours to have that verified. The present price for a substantial tramp steamer of 7,000 tons dead-weight capacity is £8 10s. per ton; that is, \$42.50, roughly—call it \$45—the cost in American money. If that was built by the Americans they would put \$2.50 extras on; they would put better winches and a little heavier bottom and probably a little more water ballast. You can contract abroad now at \$45 a ton. Before this difference in iron I believe that you could have contracted, possibly, for—during the depression, say—you could have contracted for 2 or 3 tramps, possibly, here at \$65 or \$70 a ton. I do not believe at any time you could have contracted at a lower price than that; but I do not think that is a comparison, for this reason, that we have very few shipyards; and it is as if we had very few shoemakers. For instance, if you pay \$7.50 for your boots and shoes, and that shoemaker is kept very busy at \$7.50, he is not very likely to solicit some hod carrier that comes along and wants a pair of \$1.75 or \$2 shoes. He can make them, but he can not make as much as if he sells \$7.50 shoes, and he is not going to cater to that class of trade so long as he can get the other trade.

Q. Then your belief and experience are, in regard to large construction, that there is a decided difference in the cost price of vessels that can be built in the United States, as compared with those built in England or Scotland?—A. I make a distinction between transient vessels; on these I believe the difference will be at least \$15 to \$20 a ton more cost to buyer here, but on the higher-class vessels (ocean greyhounds), that requires much joiner work, etc., the percentage of difference between European and American prices is not as great.

Q. But it is on the common carrying vessel?—A. The common American tramp will cost the buyer from \$15 to \$20 more, because we charge more here.

Q. (By Mr. KENNEDY.) If the Baldwins and other manufacturers of American locomotives can make locomotives and sell them in England in competition with English manufacturers and in other parts of the world, why is it that American shipbuilders can not build ships as cheaply as the English can?—A. The reason that the Baldwins made some of these English contracts recently was entirely because they could deliver the goods almost offhand, and buyers could not find anybody abroad that could deliver them within 12 months. That is the reason they got those contracts, particularly the English contracts.

Q. Well, the American locomotives have been going to all parts of the world in competition with the others?—A. Yes; there has been a tremendous business done, and very often on account of time; and there is no doubt but what we have got up to that point. The same thing is true of steel rails. Steel rails during this depression were sold very largely to the British Government, and the British officials were taken to task on it and asked why they did it, and after beating around the bush for a while, they said: We did it because we needed 70,000 tons (I believe it was), and we bought them in America because we could buy them \$31,000 cheaper than in England. We have got to that point on steel rails and locomotives where we can compete with the world, but we have not got there on steamers. Now, are you going to keep us a few more decades where we are, or are you going to give us a chance?

Q. (By Senator MALLORY.) We have fixed the fact of the cost of building in this country as against others.—A. The tramp steamers, I meant.

Q. I mean tramp steamers, or, say, freight-carrying steamships; and that may be accepted as settled, for the present at least, as a factor against America building steel or iron steamships of that class. Now, in addition to that we must consider the cost of running these vessels. I asked you, with regard to these chartered vessels, whether the crew and officers were paid by the owners of the ship or by the charter party, and you stated, by the owners of the ship. In other words, they received European wages. Can you state what is the per cent of difference between wages paid the average American sailor, or fireman, or stoker, mate, and captain, and the wages paid the sailors and officers of the vessels of France, Italy, England, Norway and Sweden, or any of these continental countries that are commercial countries?—A. We have all that data as a matter of record in our office. I have a general idea,

but I would prefer to give it to you exactly rather than by percentage now. If you will formulate your questions so as to ask what all nations pay their men at the present time, including, of course, the United States, I will be glad to give you the information.

Q. We would like to have it, as it is a matter of importance.—A. I can say, in a few words, the difference is not as great as sometime ago, but there is a difference.

Q. (By Mr. A. L. HARRIS.) I would like to ask to what extent the difference in cost of labor in this country in shipyards, and the cost of labor in foreign countries in shipyards, goes to make up this difference of 20 per cent?—A. The labor, I believe, is largely the element. Of course, it can not be steel and it can not be iron, and it can not be wood, because we know we are producing that as cheaply as any people in the world; but when you come to the question of labor, I am reminded of what an old Dutch captain of ours said sometime ago to me. He said: "It is cheaper for me to metal my vessel in Philadelphia, and pay \$2.50 wages, than it is for me to go to Rotterdam and employ labor there at \$1 a day. I get so much more out of the labor, and it takes so much less time for the work to be completed." So, while the labor over there is cheaper on the face of it, the labor here is—when you come to take the work it produces—not unnecessarily dear.

Q. (By Mr. CLARKE.) Is that true of every department of the work?—A. No; I think it would be more true of the commoner parts of the labor.

Q. (By Mr. PHILLIPS.) Then what goes to make up this difference in the cost, if the steel is as cheap and the wood is as cheap and the labor, while paid more, is more efficient?—A. I do not wish to undertake to dodge the question; but, as I stated, there have been no tramps built, and we have nothing to guide us very well. If anybody should offer tramps, transient steamers, or freight steamers, more properly called, because there is a feeling against that word tramp, but it is so customary now; we hardly ever speak of them except as that—if anyone was to offer American tramp steamers now of 7,000 tons capacity at \$50 to \$55 a ton, I believe they could find buyers for all that could be put on the market, and they would go out, notwithstanding they would be handicapped by the enhanced cost. At 7,000 tons—I am speaking of cost per ton, dead-weight capacity—and if you take it at 7,000 tons, and multiply that by 55, you get \$385,000. You must immediately pay a large interest and insurance account, because you must insure that enhanced value; but even at that, you can go into that very remunerative trade legitimately, and get your dividends regularly.

Q. (By Professor JOHNSON.) It seems to be the opinion of the Commissioner of Navigation that it costs considerably more to navigate vessels under the American flag than under a foreign flag; that the cost of operating a vessel after it is constructed is a serious item that ought to be considered. What is your experience in regard to that?—A. That was measurably answered when the question of wages and what is termed grubbing came up. There is no doubt but what all foreign vessels are operated, both in manning and provisioning them, at a cheaper rate than American vessels are. But this difference I am confident at the present time is not as great as it was formerly.

Q. (By Senator MALLORY.) If your ideas were to be carried out, that is, for Congress to amend our navigation laws to such an extent as to enable parties to go into the markets of the world and lease such vessels as they want to put in the foreign trade of the United States, excluding them rigidly from our coastwise trade?—A. Or do any trading within a thousand miles of the United States.

Q. Now, if that could be carried through, would not the fact that there is an additional cost in maintaining and operating the ships abroad, by the higher wages which the American seamen have always obtained, the higher wages which the American ship officers, masters, and mates have always received, and also the better quality of living aboard ship which has been enjoyed, I think, by our sailors as distinguished from sailors from almost all nations of the world, would that not make the cost of running the ships so much greater as to necessitate our vessels charging a higher rate of freight than tramps of England or other commercial nations?—A. I should say most emphatically, no. It might result in reducing our percentage of profit until we got to understand and practice some of the economies that foreign nations use, but it would not prevent our having a very remunerative business. In addition to this ownership of foreign vessels, or right to buy foreign vessels, I do not say but what it might be well to encourage by subsidies; but in addition to subsidies, I would give the right, under rigid restrictions, of the purchase of modern tonnage to every man, if you choose, until you get something to be afraid of, and then limit the amount. I would give American citizens the right to purchase them and put them under the flag and subject to the rights of the Government under certain conditions. I quote that condition because it would take too long to

build up our marine in any other way. You can not construct a shipyard plant as you can put up a lot of tents. You know it takes years to get the proper force and machinery together, and then after that it takes the first year and a half or 2 years to build a vessel and launch it.

Q. Has your business enabled you to form any idea of the supply of tonnage for our coastwise trade as to its being abundant or otherwise?—A. The coastwise trade is in the hands of certain interests who are alive to the demands of that trade, and I think they have been very clever, as a rule, in keeping the demand supplied.

Q. Well, there is no such disparity between American tonnage for our coastwise trade and the trade itself as there is between ocean-going steamers?—A. You can not compare them really, because the first is sufficiently—you might say amply—supplied, and literally there is not anything of the other.

Q. And according to your judgment it would be years now before we could even make any appreciable start in the way of supplying ocean carrying ships?—A. Of our own construction. That is indisputable, I consider it. I hope you will not think I am too positive.

Now, I am not going to stop on that 300,000 tonnage question until I furnish you a list. I will furnish you a list of all the vessels that I have included in that. That is the simplest way to do it, and then allow anyone else to put in any others that they may find suitable to go across the Atlantic and Pacific.

Q. In your experience with foreign shipowners, have you encountered the fact that many individual ships, old ships, from the greater shipowning nations could be put in trade to make money?—A. We have had a rather unique experience of that character. I have one man in mind there that we bought probably 10 vessels for within the last 15 years. He generally bought old American or old English ships, and has put them under the Dutch or German flag, and in every case he has, by his careful management and economies and so on, paid for them within a reasonable length of time. I do not think at the present that he is in debt over a few thousand pounds.

Speaking again about the people of other nations buying foreign vessels and running them, the Norwegians did that about 5 to 8 years ago to a very considerable extent. I am very glad you asked that question. We have a knowledge of the names and the details of them. They bought British tramps of 2,500 to 3,500 tons capacity. That was about as large as the old vessels were. They took them and made money out of them; and those same men have taken that money (we do not sell them any second-class vessels now) and they have gone right into England and bought new steamers. And this same set of men from whom we have to-day four Norwegian steamers chartered are the same men that formerly bought those second-hand vessels. Now they go and build new vessels and launch them themselves and run them. They are the people that are making this 20 to 25 per cent profit on their vessels.

Q. These new vessels are built out of the old vessels?—A. Out of the profits of the old vessels largely.

Q. Are the Norwegians doing that now—continually buying ships?—A. Their great specialty was sailing vessels a few years ago. They have gone out of that, and are selling them off as rapidly as possible and going into steam.

Q. (By Mr. CLARKE.) I would like to inquire, Mr. Chairman, if Mr. Neall has considered the subject of a revival of the discriminating-duties laws which prevailed in the early history of our Government?—A. I have at times given some little thought to that subject, but when I got hold of a piece of lead pencil and figured what it amounted to, it seemed to me that it would, in the first place, be very inefficient and ineffective, and it would be a direct bid for all other nations to in some way discriminate against us; and I can not see how it would be any different from a case of lifting yourself up by your suspenders.

Q. How could they discriminate against us any better than they did before?—A. Will you state your proposition definitely, what you propose in the discrimination? I am familiar in a measure with those laws, but if I could get something specific and definite so that I could get it down to dollars and cents per vessel, it would suit me a great deal better.

Q. Without going into figures, the substance of the policy is that goods imported in vessels not owned in this country will pay a higher duty than goods imported in vessels of American ownership. That is the discriminating duty that prevailed successfully in the early history of our Government, and under which American shipping took precedence of all the shipping in the world. Now, what would you say to a revival, a gradual revival perhaps, of that policy?—A. I do not think that necessary. I would not like to admit that I thought that a discriminating duty had necessarily very much to do with the supremacy of our former tonnage position. I think it was much more because we built a better and a tighter ship, a faster ship, one that was more ably manned and commanded, and that we could make the passage between given points, and did make them, in a materially

shorter time than the vessels of any other nations, and when we got to our port of delivery we delivered the cargo in better shape. I think that was the reason.

Now, when I made my answer a few moments ago in reply to the discriminating-duty question I recalled a few things, taking up that question and reducing it to so many cents per ton, with respect to a number of principal articles of our imports, which might be said to be the rough articles—sugar, ore, and all the principal articles. I will speak of that for a moment. Now, the duty on ore is about 45 cents a ton, and on sugar was a cent a pound, roughly. May I ask you to take the question of ore, which next to sugar is probably the largest single article of import, and say what discriminating duty you would put on ore imported by American vessels?

Q. I am not testifying.—A. I did not mean to put that question to you in any impolite or improper way; I only wanted to get the information. I will then in one sense answer it. I thought that if, for instance, you take the duty on ore as 45 cents, or 40 cents, and put a 25 per cent discriminating duty in favor of ore imported in American vessels, that would be 10 cents a ton. Ten cents a ton is 5 pence a ton. When you come to get to your market at Elba, or Huclva, or Poti, or Rio, you find, for instance, 3 vessels in port; an American vessel carrying 5,000 tons is alongside a British vessel carrying 5,000 tons and alongside a Norwegian vessel carrying 5,000 tons. A man wants to ship 5,000 tons of ore to Philadelphia. He goes to the American vessel and says, "What do you charge?" The captain says, "I will bring that for 12s. 6d. a ton"; and the American captain says to him, "Look here; you remember now if you ship by my vessel you get a discriminating duty of 25 per cent." He says, "I know. That is 5d. per ton off this 12s. 6d." He goes to the Norwegian or the British vessel and says, "What are you going to charge me to take this ore to Philadelphia?" The captain says, "I will take that at 12s." Now, that man is going to follow you down according to any discriminating duty that you get on that ore, just as long as you go down, and he will still have something left at the end.

Q. You think he will reduce again?—A. Yes; and I think that the law would act mainly in so many ways to irritate foreign nations to make discriminations against us in other ways, of port charges, or light dues, or harbor dues, or something of that kind; that it would do more harm to the enterprise than good.

Q. Is it not a fact within your knowledge that shortly after the discriminating duties were repealed in the forties, that prevailed from 1817 to 1846, inclusive, American shipping began to decline, and has declined almost ever since?—A. I will answer you frankly, and say that I have very little knowledge of any of these subjects prior to 1861, when I entered business, and I have not been such a student as would put me in a position to answer that question. I am not evading it; I would answer you frankly if I had the information, but really I am without it.

Q. (By Mr. PHILLIPS.) We would be pleased to have anything from you of your own that you have to submit to the commission.—A. I do not know whether it would be amiss to refer to a subject intimately connected with transportation, and that is the question of pooling. I had the pleasure, without his knowledge probably, of meeting Senator Mallory here in 1894, at the time the Patterson pooling bill was up, and there were some committees down here which were very strongly opposed to pooling, unless it was under the supervision of the Interstate Commerce Commission. Now, I do not wish to appear as an advocate of pooling, certainly not unless under proper restrictions and the supervision of the Interstate Commerce Commission; but it is a very difficult question, and I suppose some of the brightest minds have given a good many years of their lives to find a way out of the transportation complications without approaching the subject of pooling, which I believe is the means which the transportation companies present as the only remedy from their standpoint. Now, I spoke a little while ago about my being connected with some committees that were protesting against discriminations in Philadelphia. Those discriminations, to be absolutely frank, were probably discriminations to remedy which required the perpetration of discriminations of another character. In other words, our port was suffering grievously in the early nineties from a diversion of traffic to New York, to Baltimore, to Newport News, and so on; and we took very decided grounds in advocating that transportation companies should not be permitted to do that. Now, probably they could not and did not bring about a different state of affairs, unless they themselves were in some way parties to another character of discriminations which involved the meeting of the differential rates to other ports. In other words, if a lot of export property is located at Chicago, and some line with a right to charge a low rate offers to take that property at that low rate, no other line is likely to get it unless they take it at about the same rate. Now, that can not probably be under the present condition of affairs; that can not be done unless one line does what the other does. That was the feature in regard to discrimination that I wanted to refer to, and whether pooling is the way out or not I do not know; but I think that not only the merchant but the railroad officials themselves would be glad if any better means than that were found to accomplish substantially the same result and enable

them to retain what would seem to be their fair, reasonable share of the traffic of each port.

Q. (By Senator MALLORY.) Does not Philadelphia get her due share now of that Western traffic?—A. At the present time and for the last year or more I think she does get her fair reasonable share. The exports last year showed that.

Q. Do you know what that is due to?—A. No. I can only imagine that it is by meeting rates that are made by other ports. I am confident of that, because I know Philadelphia has had her share.

Q. Have you lowered your port charges at all?—A. No; the port charges are as favorable, as economical, in Philadelphia as at any other port, and that was the basis we made in our discrimination arguments; that we could take a ton of import traffic or export traffic and handle it between vessels and between the ocean carrier and the inland carrier, either way, east bound or west bound, as economically as it could be done elsewhere, almost more economically than it could be done at a good many other ports; and therefore, if we did not get our share of the traffic, there was some other reason. We furnished the resistance, so that the traffic followed that line which offered the least resistance.

Q. Have there been any new connections made whereby Philadelphia has had another route west, or the west has had another route to Philadelphia, since 1894, the time to which you refer?—A. No. We have had practically four trunk lines both then and now.

Q. Now this condition whereby Philadelphia has her due proportion of that traffic has been brought about by some cause?—A. (Interrupting.) Not incident to the establishment of additional lines.

Q. Some cause independent of Philadelphia, of the city itself; some other influence or advantage of commerce?—A. Well, our harbor has been improved and our channel has been somewhat deepened, although it is very far short of what we ought to have yet.

Q. What have you in your channel?—A. Well, we can not and we do not claim over 25 feet. We have to anchor going up or down. If we draw over 22 feet we have to anchor at some time. You start a vessel away from Philadelphia and she can not go out without anchoring if she draws over 23 feet 6 inches, in an ordinary tide. We have several shoals, you know, down the river.

Q. Well, from your remarks we infer, or I would infer at least, that you are in favor of permitting the railroad transportation lines of this country to make pooling contracts under certain conditions?—A. Well, I have never had any different views from that. That was the position we took of the Patterson bill. The elimination of four words changed the whole bill.

Q. (By Mr. RATCHFORD.) What proportion of the Atlantic coast trade is carried on by American steamers and American sailors?—A. Absolutely every ton of it. It is impossible for a foreign vessel to load a barrel of flour and deliver it at New Orleans or Boston or any other American port. She can not even take it to San Francisco.

Q. Is the same true of the Pacific coast?—A. Yes. You can not load a ton at an American port on a foreign vessel and deliver it at another American port, even if you round the horn between taking it aboard and delivering it.

Q. (By Mr. CLARKE.) In other words, protection is applied to the coastwise traffic and not to the trans-Oceanic traffic?—A. Well, protection is applied to the coastwise traffic certainly, and always has been; but assistance is not applied to the trans-Oceanic.

Q. (By Senator MALLORY.) Protection is applied to the ocean trade so far as the purchasing and owning of ships is concerned now, and none but an American citizen can own an American ship, and none but an American-built ship can be owned by an American citizen.

Q. (By Mr. PHILLIPS.) Do other nations have these same regulations and laws in regard to their coastwise trade; England, for instance?—A. I think not. We have never had enough to make it worth while, and I do not think there is anything to prevent our American ships from going to Liverpool and loading a cargo of coal and taking it around to London.

Q. (By Professor JOHNSON.) I think some 40 years ago they had that restriction as to the coastwise trade.—A. I never heard of any such restrictions.

Q. (By Mr. KENNEDY.) While foreign-built ships are excluded from the coastwise trade of the United States, foreigners are not excluded from manning those ships?—A. Yes; from any official position on them, captain, mate, and so on.

Q. And sailors?—A. There are not many questions asked about the sailors any more when an American ship comes to port. You do not suppose when an American ship comes in she gets American sailors. Probably the American sailors will all leave the American ship after she is in Liverpool or Antwerp or Hamburg 24 hours. Then she gets a new crew.

Q. Is it true that there are more foreigners on our coastwise ships than there are Americans?—A. I should not like to say that there were more foreigners, but I should think probably 50 per cent were foreigners at least.

Q. Fifty per cent?—A. Yes. You could pick out isolated cases where you would find a schooner sailing from some port that would have a great many New Englanders on board, and then you would have another that would have only three American citizens in the crew. The officers and engineers must all be Americans.

Q. One of the officers of the Atlantic Coast Seamen's Union has sent a statement to the commission stating that there are more foreign seamen in that trade than there are Americans.—A. There are a great many Germans and Norwegians and Danes and Swedes that come over here on their vessels; and, as you were saying some time ago, the wages being so much higher, they leave the trans-Atlantic ship and ship coastwise on some American vessel.

Q. Is it because there are better conditions on those vessels?—A. Somewhat better wages and better grub.

Q. (By Mr. RATCHFORD.) Have you anything to say as to the nationality of those men who man the ships on the Pacific Ocean?—A. I do not suppose they are materially different in nationality from what they are here.

Q. Are there not large numbers of Chinese and Japanese crews there in American vessels?—A. American vessels, no. You very rarely see Chinese sailors in an American vessel; they would not be allowed. The vessel that brings a single member of its crew, or even a steward, into port, is under certain restrictions. One of our Norwegian steamers trading here regularly for some 6 or 8 months, has had Chinese cooks, and they have to make certain provisions every time that vessel comes into port to see that the custom-house officials are sure that they are aboard when the vessel goes out. It is a great detriment that it has to be done. The vessel is subject here to all sorts of unnecessary inconveniences. I will say, as a matter possibly of information that a number of British steamers within the last 2 or 3 years have come here with complete crews of Lascars. They are secured out in the East Indies at a good deal cheaper rate of wages than the British seamen get, and the British get somewhat cheaper than the American, so that it has been very much more profitable for those owners; but not as profitable as it might appear on the face of it, because they have to take more of them to get the same result.

There is just one more point I would mention, and that is to give you an idea of the volume of remunerative business or money which we are kept out of by not having a marine. Within the last 8 weeks we have collected for British and foreign shipowners over \$600,000 of freight money on cargoes which they had delivered.

Q. (By Senator MALLORY.) Philadelphia and New York?—A. Philadelphia and New York, yes; we have collected over \$600,000 in the last 8 weeks.

Q. (By Professor JOHNSON.) I would like to ask Mr. Neall how much he thinks we pay foreign vessels for the carriage of freight?—A. I thought probably you would ask that question, and I thought I would try and see if I could check some figures I have seen recently issued.

Q. Would it be a great trouble to you to complete such a notation and send it to us?—A. No; I will do so. (See supplemental statement, p. 176.)

Q. (By Senator MALLORY.) Can you state exactly how many regular lines of American steamships, ocean going, sail out of the ports of the United States at the present day?—A. Do you mean for trans-Atlantic and trans-Pacific ports and to the West Indies?

Q. Trans-Atlantic or trans-Pacific; nothing in the West Indies or domestic ports; across the Atlantic and across the Pacific. What regular lines are solely American lines?—A. Not a single one on the Atlantic seaboard, and I should very much doubt if there were three on the Pacific.

Q. Can you mention those on the Pacific?—A. I had in my mind the Honolulu, or the Seattle connections of the Northern Line. I can not tell you exactly what they are. That is another question I would rather answer specifically. (See supplemental statement, p. 176.) There is no line out of the United States that is composed solely of American boats which cross the Atlantic. The American Line is pretty near it, with the *St. Paul*, the *St. Louis*, the *New York*, and *Paris*; but they are supplemented with the British boats and the Belgian boats.

Q. They have American vessels with American registry on that line; those four? A. Those 4; and up to the time the Government took them, they had the *Ohio*, *Indiana*, *Pennsylvania*, and *Illinois*. The Government bought the *Illinois* and has chartered the 3 other boats.

Q. That really is the only pretense to an American line on the Atlantic or on the Pacific?—A. That is absolutely the only American-built and American-owned trans-Atlantic line on the Atlantic coast.

176 HEARINGS BEFORE THE INDUSTRIAL COMMISSION.

Q. So far as built is concerned, they are not even all American built?—A. No; the *New York* and *Paris* are not.

(At a later date the following supplemental statement was submitted by Mr. Neall as a part of his testimony:)

PHILADELPHIA, October 12, 1899.

UNITED STATES INDUSTRIAL COMMISSION,
Washington, D. C.

GENTLEMEN: *Statement to the effect that the merchant marine of the United States (steam and sail) of 1,000 tons gross register and upward, and under 20 years old, flying the American flag, and suitable and available for trans-Atlantic or trans-Pacific trade, does not exceed a total of 300,000 tons gross register.*

Complying with the promise which I made at the hearing before your commission on 6th instant, to substantiate with details the assertion then made by me as above recited, I inclose herewith an itemized record, which I believe to include the rig, name, gross register, place, and date of building, and port of registry of every American steamer and sailing vessel comprised in the foregoing category.

Surprising as the figures given in my testimony may have appeared, they are indeed an understatement of vital facts intimately associated with the continued prosperity of the commercial interests of the United States. The value of the merchandise exported by the United States to foreign countries during the last calendar year (that is, ending December 31, 1898), was in round numbers \$1,200,000,000; the value of our imports of foreign merchandise during the same period was roundly stated at \$600,000,000, making the sum total of exports and imports for 12 months upward of \$1,800,000,000, an aggregate movement of merchandise of the value of \$150,000,000 per month.

The aggregate weight of the exports as above was about 30,000,000 tons (of 2,240 pounds), of which—

| | Tons. |
|--|-----------|
| Corn contributed, say..... | 5,000,000 |
| Wheat..... | 4,000,000 |
| Lumber, timber, staves, etc..... | 3,000,000 |
| Oils..... | 3,000,000 |
| Coal..... | 2,800,000 |
| Cotton..... | 2,000,000 |
| Flour and meal..... | 1,700,000 |
| Provisions, beef, pork, lard, etc..... | 1,200,000 |
| Oil and cotton-seed cake and meal..... | 700,000 |
| Iron ore, iron, steel, etc..... | 700,000 |
| Fertilizers..... | 500,000 |

The imports for same period may be approximated in weight as 7,500,000 tons (of 2,240 pounds), of which may be noted, in part—

| | Tons. |
|---|-----------|
| Sugar, amounting to..... | 1,600,000 |
| Coal..... | 700,000 |
| Chemicals, drugs, dyes, etc..... | 600,000 |
| Hemp, jute, sisal, and other vegetable fibers and manufactures thereof..... | 500,000 |
| Iron ore, iron, steel, etc..... | 400,000 |
| Coffee, cocoa, etc..... | 400,000 |
| Cement..... | 350,000 |
| Salt..... | 150,000 |
| Rice..... | 100,000 |
| Wool, and manufactures of wool, etc..... | 100,000 |
| Wines, spirits, etc..... | 50,000 |

In other words, the actual export and import ocean traffic out of and into the United States during the last calendar year aggregated a total of over 37,000,000 gross tons, dead weight, say over 3,000,000 tons per month.

In this connection it may be noted that, according to Lloyd's Register of British and Foreign Shipping—

| | Tons. |
|---|------------------|
| Total steam tonnage (gross), in vessels of 100 tons or over, of the world is..... | 20,800,000 |
| Total sail tonnage (net), in vessels of 100 tons or over, of the world is..... | 6,800,000 |
| | <hr/> 27,600,000 |
| Of above Great Britain owns, say, one-half..... | 13,900,000 |
| Of above United States owns, say, one-eleventh..... | 2,400,000 |
| Of above Germany owns..... | 2,400,000 |
| And Norway is next with..... | 1,700,000 |

a Less than 300,000 tons of the United States total suitable and available for transoceanic traffic.

TRANSPORTATION.

177

The statements A, B, C, and D, which I append hereto, embrace all the United States vessels at present suitable and available that could possibly participate in the movement of this enormous transoceanic traffic, which traffic actually, not theoretically, now exists, and must be carried by the vessels of some nation or nations, and the volume of which should naturally increase as the years go by. The statements show—

| | Tons. |
|--|---------|
| 140 steamships, with aggregate gross register of..... | 399,425 |
| 52 ships, with aggregate gross register of..... | 111,483 |
| 14 barks, with aggregate gross register of..... | 18,870 |
| 88 schooners, with aggregate gross register of..... | 115,101 |
| 294 Total gross register..... | 644,829 |
| From this total should be deducted, as not intended, and in reality unsuitable for the transoceanic trade, having been constructed especially for the requirements of coastwise or near by commerce— | |
| 169 vessels of gross register..... | 348,644 |
| Leaving as suitable and available for transoceanic traffic 125 vessels of gross register.... | 296,185 |
| Of which are steam, 47 vessels, gross register..... | 149,040 |
| And of these latter 23 steamers with gross register..... | 73,420 |
| were built abroad, and subsequently, under various conditions, granted United States register. | |

NOTE.—All vessels have been numbered on each of the Schedules A, B, C, and D, and the deductions on each schedule are itemized and reasons assigned for the exclusions.

In view of the foregoing facts, the question which was put to me by your committee, "What laws, if any, do you think ought to be enacted on the part of Congress or the States in the interest of ocean transportation?" may, it seems to me, be answered as follows:

In addition to such assistance as the United States Government may see fit to extend to merchants, shipowners, or shipbuilders in the shape of subsidies, bounties, or postal considerations, in order to encourage the building of the higher class of merchant steamers, suitable, if required, to be used by the United States Government as auxiliary cruisers, transports, etc., and to assist in maintaining the mail service with other countries, and without questioning the great value of the existence of such a fleet to the General Government, as well as to our maritime and commercial interests at large, let us with the greatest possible promptness have enabling acts passed by the next Congress granting to citizens of the United States—

(a) The right to purchase foreign bottoms, steam and sail, and put them under the protection of the United States flag, with such restrictive conditions as will amply protect the existing coastwise merchant marine. These conditions should include the prohibition of the foreign-built craft from ever engaging in our coastwise trade or in trade with any foreign port within, say, 500 miles of the shores of the United States proper, as existing on January 1, 1898; and these foreign vessels so acquired should each have a dead-weight capacity of not less than, say, 5,000 tons, if steamers, or, say, 2,500 tons, if sailing vessels; further, they should not be over 5 years old at time of purchase.

(b) Should this project for any reason seem not to be practicable, then I would suggest the consideration by Congress of legislation permitting our citizens to purchase and place under the United States flag the same kind of tonnage as mentioned above, and under the same character of rigid restrictions as to employment, but with the additional proviso that such purchases of foreign-built tonnage must, as an experiment, not exceed a total of, say, 500,000 tons net register, and that on them must be paid, as duty to the United States Government, the sum of \$5 per net registered ton, say \$1 per ton on date of admission to American registry and \$1 per ton annually thereafter until the entire \$5 per ton shall have been paid.

What seems to be especially needed, if American-owned vessels are to participate to any appreciable degree in transporting between our shores and those of foreign countries the great commerce that is continually passing across both the oceans that wash our coasts, is that our merchants should have the facility of flying our flag, not alone on high-class passenger and mail steamers, but also on the plain, economically constructed, unpretentious freighters which are called "tramps;" for it is this latter class of vessel, that travels with an average speed of 8 to 10 knots per hour, that transports by far the greater bulk of the world's ocean commerce. Some such legislation as has been indicated in general terms above would, it seems to me, be a practical step toward the attainment of that end, at absolutely no cost to our Government and to the material profit of American citizens.

Neither would there be injustice wrought thereby to American shipyards, from which there is not to-day afloat a single ocean "tramp," and which shipyards, in all probability, could not within 2 years from this date build and place in commission a

couple of dozen such steamers of 7,000 tons dead-weight capacity each; and in this connection, promptness, as well as practical action, is an essential factor.

In conclusion, I would mention as a pertinent illustration of the desirability—I might almost add necessity—for some such legislation as is suggested above, that for many years it has been customary for Norwegian merchants and shipowners, purely as a commercial transaction and without governmental aid, and without a home commerce in which to engage these vessels, to buy foreign-built freight steamers (and more recently to have them especially constructed for them in foreign shipyards) place them under the Norwegian flag, and engage them in the transportation of merchandise in every part of the world. At the present time, for instance, there are no fewer than 55 such steamers, averaging over 3,000 tons gross register each, flying the Norwegian flag (see Statement E herewith). These are mostly under time charter, and in the majority of cases to merchants of the United States, making a fleet whose aggregate dead-weight carrying capacity is materially greater than that of the entire list of steamships now under the United States flag, suitable and available for trans-oceanic commerce. These Norwegian steamers are less than 5 years old, with the exception of 21, which latter were built, 10 in 1891, 3 in 1892, 4 in 1893, and 4 in 1894. These steamers pay their Norwegian owners, as a rule, from 15 to 25 per cent per annum profit on the investment, besides the profit which they may yield to the American or other subcontractors, or time charterers. The equivalent of this fleet, which aggregates 169,900 tons gross register, could be built to-day in foreign shipyards for, say, \$11,500,000, but the cost to the present owners was materially less than this.

If American ownership of modern foreign-built ocean freight steamers were promptly authorized by Congress, I believe it would prove a safe, popular, and remunerative additional source of investment for funds of American citizens, and would be widely availed of throughout the United States.

Yours, very truly,

FRANK L. NEALL.

NOTE.—In considering the relations of the terms net register tonnage, gross register tonnage, and dead-weight capacity, as applied to the ordinary modern tramp steamer, a reasonably accurate practical rule is that 50 per cent added to the tons net register will give the approximate tons gross register, and 50 per cent added to the tons gross register will give the approximate tons of dead-weight capacity.

F. L. N.

A.—List of all merchant steamships of 1,000 tons gross register or over, under 20 years of age, hailing from Atlantic, Pacific, and Gulf ports of the United States.

| Total | | 115,101 | | | |

NOTE.—Of the foregoing 88 schooners, aggregating 115,101 tons gross register, only 12 (Nos. 7, 14, 16, 21, 29, 33, 36, 44, 52, 64, 82, 84), aggregating 16,812 tons gross register, have ever made a trans-Atlantic or trans-Pacific voyage. At the present time (October, 1899) but one schooner (No. 44) of the entire list is engaged in transoceanic business, the remainder being employed in the coastwise or other near-by trade, for which they were especially designed.

It is assumed that only those schooners of the above list which have made transoceanic voyages are suitable and available for transoceanic trade.

184 HEARINGS BEFORE THE INDUSTRIAL COMMISSION.

E.—List of steamers under the Norwegian flag, averaging over 3,000 tons, gross register, owned by Norwegians, and engaged in transoceanic commerce.

a Nos. 4, 19, and 52 built in Norway and Denmark.

WASHINGTON, D. C., October 6, 1899.

TESTIMONY OF MR. N. B. KELLEY,

President National Association of Freight Commissioners, member of the Committee on Transportation of the National Board of Trade, and Freight Commissioner for the Trades League of Philadelphia.

The commission met at 2.20, Vice-Chairman Phillips presiding. Mr. Phillips introduced the witness, Mr. N. B. Kelley, of Philadelphia, who, having first duly affirmed, testified as follows:

Q. (By Senator MALLORY.) What is your name?—A. N. B. Kelley.

Q. Your residence?—A. Philadelphia.

Q. What is your occupation?—A. I am freight commissioner for the Trades League of Philadelphia, which is a corporation of merchants organized for the furthering of the interests of the mercantile community of the city of Philadelphia. Under the direction of that organization it has what is known as the freight transportation bureau, which looks after the interests of the shippers to and from the port of Philadelphia.

Q. Are you connected in any capacity with any other commercial body of Philadelphia?—A. No.

Q. Will you state the purpose and object of this organization you have just mentioned?—A. The organization is formed for the purposes of protecting the interests of business men of Philadelphia as regards legislation, discrimination, or anything that might be a detriment to the city of Philadelphia.

Q. Well, now, of the transportation bureau, particularly.—A. The transportation bureau is formed for the purpose of acting as a mediator between the transportation companies and the merchants, members of the association. They have the benefit of the advice of the freight commissioner without any expense other than membership in the organization. We take up questions of rates and claims and all grievances that we may have against transportation companies or water lines operating to and from the city of Philadelphia.

Q. That character of organization is not peculiar to Philadelphia alone, is it?—A. No; there are about 25 freight bureaus in the United States.

Q. They are in the principal cities, I suppose?—A. Principal cities—Chicago, St. Louis, New Orleans, Savannah, Charleston, Cincinnati, Philadelphia, Pittsburg, Kansas City, and a few other of the Western cities.

Q. Will you state, if you can, to the commission your method of action when there is a grievance of which you merchants have just cause to complain; the course of procedure that you follow in order to rectify it?—A. We take up the grievance with the railroad company at fault, and if it is a case of discrimination and is not corrected, we then present the matter to the Interstate Commerce Commission and take it up through them. We are peculiarly situated in Philadelphia. We have New York on one side of us and Baltimore on the other, and we practically have only 4 trunk lines. If a line that is running into New York is enabled to make lower rates to the merchants there than we can secure for Philadelphia, it acts as a discriminating influence against the merchants of Philadelphia doing business; and when we find that such is the case we take it up with the lines having their termini in our city, with a view to securing a rate which will put us on a parity with New York. We do not ask for anything lower than a rate that will put us on a parity with other cities on the Atlantic seaboard. Take for instance, on grain. We have a differential of 2 cents under New York, and Baltimore has a differential of 3 cents under New York, 1 cent under Philadelphia. If we know that the tariff is being maintained on grain to New York and Baltimore we have no complaint. And I would like to say that during the past year, at least since the letter sent to the Interstate Commerce Commission by the President of the Baltimore and Ohio Railroad Company, rates have been better maintained, so far as my knowledge goes, than they have at any time during my connection with this organization, which has been during past five years.

Q. Do you mean that the rates are kept more equitable and without being unjustly discriminatory to any particular place?—A. Yes; I believe, in other words, that the railroad companies have adhered more closely to the published tariff rates. A large volume of traffic has passed through the various ports. They have all received their fair share of it, and there has been no necessity for making any reductions in the rates.

Q. You are of opinion, I judge, from that remark, that when there is an abundance of traffic there is less unjust discrimination in regard to individuals?—A. Strange to say, I do not think that that has been so in the past. It seems to me, from my own experience, that the railroad companies have made greater efforts to secure business

when there has been an abundance of traffic, in the past, than when there was a scarcity of business; but, as I say, since the 1st of January I think they have adhered to the tariff rates, so far as I know.

Q. What do you ascribe that to? A. Competition. You mean as to adhering to the rates? The Interstate Commerce Commission, through its chairman, I believe, invited the presidents and managers of the various trunk lines to a conference with the idea of devising some plan by which rates could be better maintained, and I think, as a result of these various conferences that they have had with the trunk line officials, great good has been accomplished. Prior to the decision of the United States Supreme Court, of course, they had their own joint traffic associations and they were supposed to maintain the rates through those associations. The commission, I think, felt possibly that by getting together and talking the matter over they could come to some agreement by which the rates could be maintained.

Q. You say that in matters of discrimination you present them to the railroads in question, transportation companies, and if they fail to comply with what you believe to be a reasonable request you make complaint to the Interstate Commerce Commission?—A. Yes.

Q. Have you done that often?—A. Not frequently; no.

Q. Have you done it recently?—A. We have not had occasion to go before the commission or to apply to the railroads operating from our own city this year. We are frequently discriminated against, not only by the railroads but by shippers, and we have one case now before the commission in which we think the discrimination is caused on the part of the shipper rather than the carrier.

Q. Will you explain what you mean by that exactly?—A. Yes; the greatest difficulty we have to contend with in the way of discrimination is falsely billing and falsely misrepresenting the character of the freight shipped, either by the shipper or the railroad companies; in this case it was the shipper. I will cite the case, if you like. We are shippers of large quantities of hardware from Philadelphia to the South. We have several of the largest hardware houses in the United States located in Philadelphia. During the latter part of last year we found it was very difficult to sell the Southern merchants. The matter was presented to me by 1 or 2 of our hardware houses; and upon investigation I found that certain houses in the Southwest were underbidding the Philadelphia merchants very materially. The rates from the Southwest to these particular points in North and South Carolina ought to be about the same as from Philadelphia. So far as we could learn the rates were the same. But upon presenting the matter to the Interstate Commerce Commission, they delegated a representative to investigate this matter, and they found that certain houses in Louisville were shipping hardware to points in the South as well as the Southwest and misrepresenting to the railroad companies the contents of the cars. They were shipping what we call shelf or high-class hardware as saddlery or other low-priced commodities of hardware; in other words, they were securing the benefit of a sixth-class rate on traffic that should bear a first-class rate. Therefore, naturally our people could not begin to compete with them without they resorted to the same practice. That case, I think, is now in the courts both in Texas and in Louisville, Ky.

Q. You say they were misrepresenting the character of this freight to the railroad companies?—A. Yes.

Q. This was done on a considerable scale in order to make itself felt as far as Philadelphia?—A. Yes.

Q. Do you mean to say that the railroad companies were not cognizant of this misrepresentation?—A. To my knowledge they were not.

Q. Philadelphia and the points that you have reference to in this illustration have also water communication, have they not?—A. Yes.

Q. Well, did that discrimination, occasioned by representing the freight at a false classification, amount to so much of a discrimination as to enable the Western hardware men to overcome the advantage which you had by way of water transportation as well as land transportation?—A. Yes; I regret to say that the water transportation of Philadelphia coastwise is very limited. In fact, Philadelphia occupies the position of only having one line between it and the South, and that point is Norfolk, Va.

Q. You do not get below there?—A. We do not get below there, and therefore all business for southern territory must either go by way of Baltimore, by rail from Philadelphia to Baltimore and thence by steamer, or go by steamer from Philadelphia to Norfolk and thence by rail the remainder of the trip. And the difference in the water rate is so small that it would cut no figure in a discrimination of this kind. The differential would only be about 5 or 6 cents a hundred pounds.

Q. Is that abuse continued now?—A. Well, we think that that abuse has temporarily been stopped, because there has been no decision rendered by the courts as yet. We tried to get an indictment before the grand jury in Louisville, but were unsuccessful, and we are still investigating the matter and hope to be able to punish those people there either by fine or imprisonment, whatever the courts may determine, under the interstate-commerce law.

Q. How long have you been connected with this league?—A. About 5 years.

Q. During that time, will you state whether you have had occasion to intervene in behalf of the merchants of Philadelphia on many occasions with the different railroads in Philadelphia?—A. We have had a number of grievances against the railroads during that time which, upon presentation to the railroad companies, have been settled satisfactorily to the merchants. In other words, the railroad companies have protected us when there was rate cutting. We were put on a parity with the other cities.

Q. What influence did you bring to bear to bring that about?—A. Simply by pointing out to them that we would lose this business if we could not compete with the rates named to other cities.

Q. Is it not a fact that in a great majority of instances the intervention of these leagues in behalf of the merchants of the cities that the leagues represent are successful with the transportation companies in cases where there are abuses of that character?—A. I think that the railroad companies, as a rule, consider seriously all questions that are brought to them by these various freight commissioners, knowing that they represent probably the better, the major portion of the shipping interests of the particular locality in which they exist, and also knowing that they are familiar with the subjects that they bring before them. It was thought some time ago that these organizations were antagonistic to the railroad companies. I do not think the railroad companies think so now. I believe they think that they are a benefit to them, because they very often prevent a great deal of their time and the time of their officials being taken up by merchants when they had any grievance. This is now settled directly through these bureaus.

Q. You have mentioned this system of false classification as one method of discrimination against particular localities. Can you give an account of any other practice by which the interests of Philadelphia are discriminated against?—A. Not as applying to Philadelphia locally.

Q. Well, speaking more broadly, then.—A. I think there are a number of discriminations on the part of carriers that affect certain interests, speaking generally.

Q. Will you mention them?—A. Well, I think this system of private cars is a discrimination. These large packing houses have private cars, and they are at an advantage over a competitor who is compelled to ship his commodity in the railroad companies' cars by reason of the fact that the railroad companies pay them $\frac{1}{4}$ of a cent a mile for the use of the cars.

Q. Well, now, let us come to that for a moment. A private car is the result of energy and enterprise on the part of the owner of the private car. He built that car and put his capital into it.—A. Yes.

Q. And of course he is entitled to any legitimate benefit that he can get therefrom. Now, where does the illegitimate benefit come to him from the use of the private car? What is there in the system which prevails now that gives him an undue advantage?—A. I think the discrimination or the undue advantage that he gains is by reason of the high rates that he gets for the use of that car. I think the railroads could very well afford to handle their cars and make money on the price they pay them for the use of them.

Q. What advantage is there to the railroad company from the use of this private car to justify paying exorbitantly for the use of it?—A. That I can not say; I can not answer that question.

Q. You know only that the evil exists?—A. I only know that the evil exists, but why it exists I can not say. As I say, we do not feel the effect of that in Philadelphia as much probably as they would in some of the other seaboard cities.

Q. Well, is there not something in the fact that by giving this payment the railroad gets more of the business of a particular individual than it would otherwise get?—A. Possibly that is so; it may get an advantage in that way.

Q. You do not know that, however; it is only a surmise?—A. Yes.

Q. Is there any other method of discrimination that you know of that your attention has been called to, not particularly confined to Philadelphia?—A. I personally can not see any reason why the railroad companies, in conjunction with the steamship companies, should make a lower rate, for illustration, from Liverpool to Chicago than is made in many instances from New York to Chicago on what is known as import traffic. I think that is a discrimination which operates against the merchants.

Q. Now, before you go any further, have you anything to say as to the discriminations made in export rates? There are discriminations made on both export and import rates.—A. The witness (Mr. F. S. Neal) whom you had before you this morning testified very particularly on that subject, and I can only reiterate what he said.

Q. I did not know but what you might differ with him.—A. No, I agree with him.

Q. Now, then, to come back to the import rates, can you give the commission some idea of the average difference between freights—say of imports from Liverpool to Chicago via Philadelphia or by way of New York, and from New York to Chicago and Philadelphia to Chicago?—A. I could not give you the difference now, but I could obtain the figures and send them to you.

Q. Well, we would be very much obliged if you would do that. It is a considerable difference, is it?—A. There is on some commodities considerable difference; yes.

Q. Do you know what reason is assigned for that?—A. No; I do not.

There is another practice which prevails among railroads during certain seasons of the year. The question of the American merchant marine was brought to your attention this morning by the witness, and it reminded me of the fact that while our merchant marine on the ocean is very small—in fact comparatively nothing—if the practice which is pursued by the railroad companies during the lake season continues, after a time we will lose considerable of that traffic also. Strange to say, the railroad companies at the beginning of the opening of lake traffic usually reduce their rates on commodities that are carried in large quantities, like sugar and coal, which is the life of the lake trade; and they reduce those rates to such an extent that they are commencing to take that traffic away from the lake trade, and immediately after the lake season they restore their rates.

Q. Has not that been characteristic of the railroad transportation lines wherever they come in competition with water lines? Is not that, you might say, essential?—A. Well, I think it is.

Q. Have they not done it on rivers?—A. Wherever they have water competition they usually do it on these low-priced commodities that they are carrying in competition.

Q. (By Mr. FARQUHAR.) You speak of the competition in the lake trade as between the railroads and the water. Do not the railroads own their own lines of ships on the lakes?—A. They own their own lines for carrying general merchandise; that is, I can not say that they own them, but they operate them in conjunction with the railroads. But I am speaking now of low, coarse freights that are carried by what are known as tramp steamers on the lakes, not as to the regular lines. The regular-line boats do not carry those low, coarse freights as a rule. They generally try to get a commodity that pays a higher rate of freight—general merchandise.

Q. You mentioned the case of carrying coal. Does not the Lackawanna carry its own coal?—A. The Lackawanna carries its own coal, probably. I do not think it carries anything like the quantity that is shipped to the West.

Q. In the freight boats that ship ores, do they not get exactly the same as the liners themselves?—A. I doubt it.

Q. How is it possible, then, to support the other lines?—A. Well, the other lines are operated, as I said a few minutes ago, by the railroad companies. They are worked in conjunction with the railroad companies, and they get the light or high-class freight that pays, where the tramp boat would not get anything of that kind, because she does not carry a general cargo. She carries a cargo of grain, for instance, or a cargo of coal, or a cargo of ore, or a cargo of oil.

Q. Can the regular railroad freighter carry at a greater price than the free freighter can?—A. Do you mean to say can she get a higher rate?

Q. Yes.—A. There would be no way of carrying it by lake except by the regular lines. These very low priced commodities, I have just said—they would not like to load and put a full cargo of coal with general merchandise.

Q. Regular rates are established on coal, for instance, at Buffalo, which is the greatest coal port of the world. The 7 or 8 trunk lines in that city, the lines of railroads, largely have their regular lines of boats which they use for their own traffic during navigation?—A. Yes.

Q. And when there is a surplus to be carried they bring in these freight boats, putting them on the same freight rate as other long-haul freight, do they not?—A. You mean to say that they charter these outside boats that do not belong to their lines?

Q. Always.—A. I do not think they charter outside boats for the purpose of carrying any low commodities now. If there was sufficient traffic west bound or east bound of general merchandise, and the railroad companies or water lines saw it was to their advantage to charter an extra boat, if they could go and get a boat at a price

that they thought would enable them to make some profit at the time, they would undoubtedly charter it.

Q. Well, when they all have their own boats in use, of course?—A. Yes.

Q. These outside boats get the current rate, do they not, from Buffalo to Duluth, Chicago and Milwaukee?—A. They get the current rate; yes.

Q. So that practically speaking, when you mentioned the competition of the railroads you did not seem to take into account the fact that the railroads own their own transportation boats on the water?—A. But they do not own them all.

Q. I speak of trunk lines. They own the water transportation, do they not?—A. I think the statistics will show you that the percentage of boats owned by the railroads is very small in comparison with the total amount of tonnage.

Q. (By Mr. RATCHFORD.) Is it not a fact that the railroad companies are largely interested in those boats in cases where they do not own the whole line themselves?—A. Well, that I can not say. I expect that they must have some interest in the boats. I can only speak for one line which is operated on the lakes, which I am familiar with, and that is what is known as the Erie and Western Transportation Company. Those boats are operated in conjunction with the Pennsylvania Railroad Company and those boats are not owned by the Pennsylvania Railroad Company.

Q. (By Mr. FAIRHUR.) They are time-chartered boats?—A. No; they are boats owned by the Erie and Western Transportation Company, which is a separate and distinct corporation. I am very familiar with that because I worked for that company and I know just what it is. Now, they have probably in their fleet 16 or 18 steamers, but they could not afford to use one of those boats to carry a cargo of coal to Duluth or Chicago and exclude other freight, because there would not be sufficient money in it for them. But there are boats on the lakes that are built for the express purpose of carrying full cargoes, not general cargoes, and those are the boats that are suffering as a result of this competition, or will suffer, in my opinion.

Q. (By Senator MALLORY.) I understood you to say that if that kept up it would diminish the number of boats very greatly; those independent general cargo boats?—A. Yes, I think it will divert the traffic from the lakes to the rail.

Q. Do you know any other case in which there is a line of freight boats owned by any line of railroad that is tributary to the lakes?—A. I do not know positively, although I think the New York Central own their boats. They have a line. I think they own them. And the Great Northern Railroad own theirs.

Q. Do you think it good policy for a railroad corporation to own steamboats engaged in the transportation of freight on a line parallel with their railroads? Do you think there is anything against public policy in the principle?—A. Only this, that the rates by water are not controlled by the interstate law; the rates by rail are supposed to be, and, therefore, a railroad owning its own boats might be in a position to discriminate, whereas by carrying the freight all rail it would be more apt to be shown.

Q. The point I wanted to get at particularly was as to the injury that may result to the general public from the monopoly occasioned by such a proceeding as that. In the first place, railroad corporations are created, as a general rule, for land transportation?—A. Yes.

Q. Not for water transportation; they are not authorized, as a general rule, except in special instances, to engage in water transportation, except where that water transportation is supplementary or complementary to their land transportation; but in some sections of this country railroad corporations have deliberately gone to work and put in on rivers—this, of course, is not testimony; I am merely giving it as an illustration—competing lines of steamboats with other river lines for the purpose of breaking down those lines of transportation, and as soon as they have succeeded in breaking down the river competition, why, up go the rates again?—A. Yes.

Q. Now, what I want to get at is whether there is any such process as that going on on the lakes?—A. Well, the information that I am giving you now in that connection is my own thought. I have not any facts or figures to give you, but that is the theory that I advance, that in time it will force these boats off the lakes, and then these rates will go up, as you state. The same practice has been in force for a long time in the river and coastwise water transportation.

Q. Until a short time ago they carried a bushel of wheat all the way from Duluth to Buffalo, 1,000 miles, for a cent and a half. Is there any possibility of any railroad doing that within the next thousand years?—A. Railroad companies have been known to carry freight at a loss for the purpose of competing with water traffic and depending, as I stated before, on the higher class commodities to make their money. The railroads of the United States to-day, statistics show, only pay $1\frac{1}{4}$ per cent interest on the amount of capital invested. Take as an illustration the Erie Canal. The railroads running from Buffalo to New York can compete with canal business on the Erie Canal during the season of canal navigation, and they do do it.

Q. (By Mr. PHILLIPS.) Carry freight cheaper?—A. They compete; I do not know whether they make any lower rates.

Q. (By Senator MALLORY.) Is there anything else you want to say on this particular point of discrimination?—A. I would like to say I have been an advocate of pooling for several years, because I believe that if such laws are enacted by Congress as would permit the railroad companies to pool it would do away to a very great extent with these failures. Competition means discrimination. I think it is a great deal better for the commercial community at large to permit the railroad companies to pool, and know that the rates are uniform and stable, than it will be for them to go on as they are now, gradually acquiring the weaker railroads and practically controlling them. If they keep on at the rate they are going, in a few years the railroads of this country east of the Mississippi River will be in the hands of a very few men, and then they will be in a position to make rates to suit themselves.

Q. (By Mr. FARQUHAR.) You say competition is the parent of discrimination?—A. I think so; yes.

Q. (By Senator MALLORY.) How would this pooling business prevent this tendency to consolidation which seems to be in operation now, not only in railroads, but in almost everything else? It has been operating probably for a very great number of years in the case of railroads, and we see it every day. How would giving them the right to pool prevent that tendency to combination; and if it does prevent that tendency, would that necessarily be a benefit?—A. I believe the fact that the railroad companies are not able to control the situation has been the cause of these so-called combinations in railroads. I think that is undoubtedly what led up to that condition.

Q. In other words, you think the weaker railroads, being unable to maintain themselves in that violent, fierce competition that arose out of these conditions, became exhausted, were driven to the wall, or gobbled up by and consolidated with the stronger ones?—A. I believe in competition, but in legitimate competition; I do not think it is legitimate competition where a road is in the hands of a receiver and has to pay no dividends on its capital stock and cuts the rate to such a point that it compels a standard trunk line, like the New York Central or the Pennsylvania, to make a rate to meet the competition. I do not think that is healthy competition. I think competition where it is the markets, the deliveries, and so on is all right.

Q. Does your idea of permitting transportation companies to make pooling contracts stop at that, or would you go further and put some supervisory control over the making of such contracts?—A. Undoubtedly I would want to see the contracts made under the control of a disinterested body; in other words, I am only in favor of pooling under control and supervision of the Interstate Commerce Commission.

Q. There seems to be a general acquiescence in the idea, except on the part of the railroads themselves, but they do not seem, as far as my observation has gone, to approve of that. They do not want to be hampered by having to submit their contracts to the approval of anybody.—A. I do not think they object so seriously to the contracts as to giving the commission the power to fix rates; some of the rates at least.

Q. (By Mr. KENNEDY.) Are you in favor of pooling under the supervision of the Interstate Commerce Commission with its present powers, or would you have the powers of the commission enlarged before permitting pooling under their direction?—A. I would like to see the commission's powers enlarged. You, in all probability, will find that the Western people are opposed to pooling. I understand you have a witness coming from St. Louis to-morrow who is a member of the St. Louis Traffic Bureau, and he undoubtedly will be opposed to it.

Q. (By Senator MALLORY.) Under any conditions?—A. I think under any conditions. I probably may be selfish in advocating pooling. I advocate pooling because I think it would be to the best interests of the Atlantic seaboard. He would probably oppose it because there are a number of lines running into St. Louis, and he can make better terms on account of the competition on the number of lines he has to work with. But I think, for the benefit of the community at large, if uniform rates and staple rates could be brought about, it would be better for the public.

Q. In connection with this subject, have you considered the question of classification as connected with discrimination?—A. I think classification is the basis of the rate-making power of railroads.

Q. What is your judgment of the advisability of having a uniform system of classification in this country?—A. I am much in favor of the uniform system of classification, and I think it ought also to be under the control of the Interstate Commerce Commission.

Q. That would be the only way to effect it, under some Government agency?—A. You can readily see the classification is really the rate-making power. A commodity

is classed under a certain head, first, second, third, or fourth class, as it may be. The railroad companies make the classification; the merchants do not make it. If they make a commodity second class that we think should be fourth class, they get the second-class rate, and we have no means of securing redress except by application to the association classification committee, and if they do not grant it we have to pay second-class rate on that commodity.

Q. The making of a classification is not an arbitrary power, but there is some reason for that classification?—A. The railroad companies always have good reasons for them. Then there are 3 classifications, Official, Western, and Southwestern, and they vary. A commodity in one classification may be of another when it reaches the territory of the Western association, and that, to the shippers, very often is inconvenient. That is one of the reasons for favoring uniform classification, which will cover the railroads of the country, rather than have 3 classifications. There are good reasons why the classification is higher in one territory than another; the district may be sparsely settled.

Q. Do you think it would be practical for any central authority, in view of all the various and diverse interests and reasons why classification should be different, to bring them to a uniform system, or anything approximating a uniform system?—A. I think it might be done. It would take considerable time and labor to do it.

Q. (By Professor JONSSON.) You have had a great deal of experience, of course, in the shipment of goods. You have the experience of the merchants of your association in the shipment of goods, and you, of course, are in the Official classification territory?—A. Yes.

Q. I would like to ask you whether there is one uniform classification in this so-called Official territory, or whether there are numerous differences practiced on the part of the various railroad companies that amount to a diversification in classification; whether we really have one classification in that territory or whether we have several?—A. Well, I can not say that the railroads would deliberately permit the shipper to classify an article under something other than the proper head it belongs to in the classification. The shippers have resorted to that practice. They use the classification of another article.

Q. So far as you know, do any railroad lines maintain for any portion of their business anything else than the Official?—A. So far as I know, they adhere to the Official classification.

Q. Could you tell us what actual disadvantage it is to a hardware merchant who wants to sell goods in Denver, a Philadelphia hardware merchant, what disadvantage it is that there are two classifications that he has to use?—A. In making the rate, say he gets a third-class rate to Chicago; when the goods reach Chicago he gets a second-class rate from Chicago to Denver; you can not figure on that rate from Chicago to Denver unless you are familiar with the classification.

Q. Both rates are published, are they not?—A. Yes. The publication of rates is a farce, in my opinion, so far as being a benefit to the shipper is concerned. Under the interstate-commerce act the tariffs are posted in the freight station. The shipper never goes to the station; he sends his truckman. The only way the merchant can secure the rate is to go to the railroad company. He goes to the railroad office, or to my office, and I secure the rate for him.

Q. That is because the rate is changed so frequently?—A. No; it is not because it is changed so frequently; it is because he is not familiar with the classification question. He has the Official classification book in his office, and if he wanted to find out what some particular article would be classified under he probably could find it, and maybe not. The easiest way is to go to the railroad and ask the rate to Chicago on hardware or whatever it might be.

Q. (By Senator MALLORY.) With reference to this matter of publication of freight rates, is it not a fact that it is rare for the shipper, say, buying in Philadelphia from Denver or from one of the cities in the South, say Atlanta, to himself investigate the different rates or different classifications on different kinds of goods?—A. He generally depends on the shipper; he depends on the shipper giving him the lowest possible rate to the point to which the goods are to be shipped. If it happens to be a point where there is water competition, of course the rate is lower by water than the rail rate, and the usual procedure would be for the merchant to ask him whether he wanted his goods to go by water or by rail. The rate he generally arranges at this end of the line, unless he gets special instructions. Sometimes the consignee will give directions to route the freight by certain lines either on account of friendship for the agent who happens to be in that city or on account of his getting a concession from one of the competing lines.

Q. (By Mr. CLARKE.) Considering that the sum paid for freight in this country is greater than all the taxes, do not you think it would be putting a tremendous respon-

sibility, a very great power, in the hands of the Interstate Commerce Commission to fix the rates?—A. Yes; I do.

Q. Do you think it would be safe for the people to intrust such a vast power to, say, 5 men?—A. No; I do not think so, for this reason: the complexion of the commission is constantly changing, and I think it is absolutely impossible for any 5 men to make rates for the railroads of the United States. When I said that I wanted to have pooling under the control of the Interstate Commerce Commission, I did not intend to say that I wanted them to have the power of fixing the rates also.

Q. Do you know of any State in the Union which makes it the part of the railroad commissioner to fix rates?—A. I am not sure, but I think Texas does. Texas and Missouri, I think.

Q. (By Mr. RATCHFORD.) Would the power of fixing the rate, in your judgment, be safe in the hands of a commission, say, composed of one representative from each State in the Union?—A. I do not think I would like to answer that question. I am in doubt about it.

Q. (By Professor JOHNSON.) How do you make any distinction between the fixing of rates as an initiatory process and the fixing of rates in a revisionary way, when you condemn the power? For instance, when you spoke against the advisability of giving the Interstate Commerce Commission power to fix rates, did you have in mind the prescribing of a general schedule of rates or power to revise rates that have been promulgated by private authority?—A. I had in my mind when I spoke the idea that the pooling contracts be submitted to a commission, and if, in their opinion, they seemed unreasonable, they could be carried to the courts.

Q. Irrespective of the question of pooling, on rate making, do you make any difference between the first process of creating and the power of revision?—A. No.

Q. Does it not seem to you that the two functions are very different?—A. I do not think I quite understand your question.

Q. One way of fixing the rates would be for the Interstate Commerce Commission to go to work and get out a schedule of rates, and promulgate it, and compel the railroads to observe that schedule; another way would be to allow each railroad to make its schedule, and each combination of companies, and put them in force, subject to the revisionary power of the National Government. Now, would you oppose the one the same as the other?—A. I would prefer the latter.

Q. Would you oppose the latter?—A. That would depend entirely on what the scope of the power of the commission might be.

Q. Of course you are familiar with the fact that it is the latter power the Interstate Commerce Commission desires subject to the superior power of the courts?—A. Yes.

Q. (By Senator MALLORY.) As I understand, your idea is that this power should be given to the Interstate Commerce Commission for the purpose of approving or disapproving contracts entered into regarding the transportation of freight by corporations; that power should be given the Interstate Commerce Commission to approve or disapprove them. If they disapprove them, then it should be taken to a judicial body or court, and ultimately determined by the action of that appellate body?—A. Yes.

Q. Do you think an ordinary judge of a United States district court or circuit court is better qualified to determine what should be a reasonable or just rate than a commission like the Interstate Commerce Commission, whose members have been devoting years to the study of this question?—A. I was referring more particularly to some specific rate that might be named that might be unreasonable. There is or there was a bill pending in Congress to the effect that any 2 or 3 railroads that choose to go into a combination for the purpose of pooling traffic and earnings may do so, but they must submit that contract to the Interstate Commerce Commission; and if there are any rates that are too high, according to the Interstate Commerce Commission, they have the right to order a reduction; and if the railroads do not agree to that, they can take it to the courts.

Q. To come to the practical point, the method by which this can be done: Is it reasonable to suppose a single judge who has never had any business of that kind before him, no familiarity with railroad matters, is better qualified to determine as to the reasonableness or unreasonableness of a rate than the members of the Interstate Commerce Commission, or men specially selected with reference to their adaptability for the purpose?—A. That is a pretty broad question. I would not like to say what, in my opinion, would be the proper thing to do.

Q. (By Mr. KENNEDY.) You stated you were in favor of the enlarging of the powers of the Interstate Commerce Commission, and now you say you are opposed to them fixing the rates or revising the rates. In what way would you have their powers enlarged?—A. I think it would enlarge the powers of the Interstate Commerce Commission if they were permitted to veto rates, such rates not to be permitted to remain

in force until decided by the judicial body. I do not think the merchant would suffer by reason of the rates not being enforced. That would certainly enlarge the powers. And there are a number of other ways in which they might be enlarged. From the national board of trade petition after petition has gone to Congress for the enlargement of the powers of the Interstate Commerce Commission. I am not prepared just at this time to state how the commission's powers should be enlarged, but that is all on record.

Q. Would not the vital matter of enlarging the powers come down to the question of rates?—A. That is one way, but there are a number of other ways in which they could be given authority that would be of importance to the commercial community. I have some resolutions here, presented by the national board of trade to Congress, on that subject, which I will be very glad to leave with the commission, covering the last 3 or 4 years.

Q. (By Professor JOHNSON.) Could you give us in a few words an account of the purpose and activity of the National Association of Freight Shippers?—A. It is for the purpose of taking up matters regarding methods of transportation, and in the event of any matters of a national character that can be presented to Congress, we frame resolutions and send them to Congress. For instance, we have already presented resolutions on uniform classification and on the antiscalping laws and a number of other subjects. It is about on the same order, so far as transportation is concerned, as the National Board of Trade. We only take up national questions.

Q. (By Mr. PHILLIPS.) Are you in favor of or against scalping—these resolutions presented to Congress?—A. We are opposed to it.

Q. Could you give some reasons to the commission why your association takes this position as regards scalping?—A. We think it is for the best interests of the traveling public that this practice should not be permitted. We think if we do not have scalping, in all probability we can get lower passenger rates.

Q. (By Mr. KENNEDY.) Do you believe, also, you will get lower passenger rates if the system of free passes is abolished?—A. That is a question I do not know much about. It is a passenger question.

Q. Do you not suppose they affect the rates more than the scalping question?—A. I understand it is a very serious evil, but I understand the roads are trying to abolish passes.

Q. (By Mr. FARQUHAR.) You think it would be better for the railroads to go to Congress for a law abolishing all passes than to abolish the broker?—A. I am not familiar with the passenger end of it at all; I do not know how far that evil exists.

Q. (By Professor JOHNSON.) You are president of the National Association of Freight Shippers?—A. Yes.

Q. You have an office as president where you conduct business?—A. We meet once a year in Washington.

Q. Your activity is practically confined to the period of your convention?—A. Yes. We have an executive committee. When any important matter takes place during the year, we call the executive committee together and act on it.

Q. This national organization, in fact, enters complaint as a national association, in case of a complaint?—A. Yes, as a national association.

Q. As in the case of the transportation committee of the National Board of Trade?—A. They do not do so.

Q. They are a committee for recommending?—A. Yes; that is all.

WASHINGTON, D. C., October 7, 1899.

TESTIMONY OF MR. A. J. VANLANDINGHAM,¹

Commissioner St. Louis Traffic Bureau.

The commission met at 11.10 a. m., Chairman Kyle presiding. Mr. A. J. Vanlandingham, being duly sworn, testified as follows:

Q. (By Senator MALLORY.) What is your name?—A. A. J. Vanlandingham.

Q. Where do you reside?—A. St. Louis, Mo.

Q. What is your business?—A. Commissioner of the St. Louis Traffic Bureau.

Q. Will you state briefly what your duties are in connection with that office?—A. The St. Louis Traffic Bureau is an organization of the St. Louis merchants and manufacturers, having about 2,200 members. The object of the bureau is to secure to

¹ Since deceased.

St. Louis fair and reasonable rates for transportation into and out of St. Louis, as compared with other cities, in order that our merchants and manufacturers may be able to meet the competition in what we consider St. Louis territory, of merchants and manufacturers of other cities.

Q. How long has that traffic association been in existence?—A. The present organization has been in existence two years and a half. The St. Louis Traffic Association, which was its predecessor, was organized in 1890.

Q. Will you state what was the cause that led to its organization?—A. It was indirectly organized by reason of a similar organization at Kansas City, of which I was commissioner. It was directly organized for the purpose of removing discrimination that was supposed to exist and did exist as against the city of St. Louis as compared with Chicago and other cities.

Q. Has it been efficacious in removing any discrimination?—A. I think so. They think well enough of it to pay about \$15,000 a year for its maintenance.

Q. Illustrate as briefly as you can, but covering as much of the matter as you can, the character of the principal discriminations which led to this action on the part of the merchants of St. Louis.—A. I do not understand.

Q. What was the method or character or form of discrimination practiced against St. Louis?—A. Of course the general practice was one of tariff rates. Wherever the St. Louis merchant had an inside rate, if there was any, he kept it to himself, a rebate or lower rate than the published tariff. My office never takes any cognizance of a proposition where a St. Louis man is supposed to have a rate different from the published tariff. If it is a Chicago or a Kansas City man, we investigate. Consequently as to rates of that kind we will not make any investigation as to any complaints that may be made as against St. Louis. Rates generally have been maintained at the published tariff during the year 1899. There were fewer rates maintained in 1898 than at any time within my knowledge of the railroad business, and I have been in the railroad business for 28 years.

Q. In what form were these discriminations?—A. In every method that it is possible to cut a rate.

Q. Can you give us an illustration?—A. One method is the payment of commissions to secure business.

Q. Payment of commissions to merchants?—A. Payment of commissions to merchants. Of course you understand in this testimony my testimony on this proposition is not testimony that could be taken into court, because I do not know of these things directly, only indirectly. Another method is by direct rebates—that is, simply so much off the tariff. Another method is by allowing a larger proportion to one line as its division of the rate than the regular division, that proportion being paid to the shipper to secure his business. Another method is by what you might say is a manipulation of rates, changing the destination in transit to a basis that will make a lower proportion. As an illustration, the rate on grain for export from Kansas City or from the Missouri River to Chicago has been 3.2 cents lower per hundred pounds than when for local consumption. The consequence has been, and proved before the Interstate Commerce Commission, that all the grain moved from west of the Mississippi River to Chicago has been going into Chicago on the basis of the through rate—that is, billed to Chicago for export. It goes into the Chicago elevator and it may go out to New England. This is a general proposition. It goes into an elevator in Chicago and it may go out by rail. If it does it goes out at 80 per cent of the published Chicago export rate; if it goes for export, 80 per cent of the Chicago-New York rate, less 3 cents. We will say the rate was 13 cents; 3 cents was deducted for New York terminals, and 80 per cent of the rate plus this 3 cents; 8 plus 3, or 11 cents, was the rate and not 13, as published. It might go by water. It was shown in the testimony that if it went by water no record was taken other than at Buffalo. The water carriers of Chicago will not keep a record of destination except to Buffalo. There it goes to the railroads. The statement "It went to Chicago for export" was a subterfuge, and the rate was cut by 3 cents a hundred pounds.

Q. Do you mean to say that to take advantage of this difference between export rates and rates for domestic consumption, all that went through Chicago went at export rates?—A. All corn and wheat; it did not apply to so great an extent on oats; it did to the same degree, but it was not noticeable to so great an extent.

Q. In that case, then, there seems to have been no discrimination between those shipping from west of Chicago to Chicago?—A. There was this discrimination: when I say all the grain, I mean all the grain that was handled by the freight shippers on these roads. There was also another termination through the St. Louis gateway. St. Louis is a competitor for Western grain. We were discriminated against to the extent of the 3.2 cents a hundred pounds, because the rate to Chicago and through was 3.2 cents less than when shipped through St. Louis. The consequence was the

grain that would ordinarily move in both directions through both cities had an undue preference to Chicago on the north and through Kansas City, a preference that was natural to a certain extent, to the Gulf.

Q. Was not that legitimately due to the lake transportation competition?—A. The lake competition has been felt always, and they have had an advantage on this ground in Chicago. In the published tariff the lake competition would have been met through the St. Louis gateway. The rates are so adjusted as to meet these situations on an agreed basis.

Q. What is the reason, in your judgment, for the difference between export rates and rates for domestic consumption, to the East on grain?—A. At some periods an export rate lower than an inland rate is probably necessary. It has not been necessary during 1898 and 1899. Our grain would have gone abroad to as great an extent, so far as the rate is concerned, if it had paid the same as the inland rates. The reason it applies on Western grain is the competition of the Gulf as against Atlantic ports. All New England rates are based upon the New York rate; that is, the rate once given from Chicago to New York fixes every rate from Dubuque on the north and Cairo on the south to every point east of Buffalo and Pittsburg.

Q. On the Atlantic?—A. On the Atlantic, yes. Now, to reduce the domestic rate to the export rate, necessary to meet the export rate through the Gulf ports, would have made so low a rate that the railroads did not feel they could afford to do so, and consequently they made this through arrangement of a lower proportionate rate for export than for domestic consumption.

Q. There was no necessity for it during 1898 and 1899?—A. None; as far as the value of the grain was concerned. It is necessary sometimes to meet the competition of other countries on wheat but not on corn.

Q. Can it be laid down as a general proposition that when there is a demand for our product there is no necessity for the difference?—A. Yes; when there is a large crop of wheat in the Argentine Republic or Russia, sufficiently great—or even Indian wheat sometimes—to control the price, then to move for export it is frequently necessary to make a lower rate than the domestic rate, for the same reason I stated a while ago, that the export business is not sufficient in volume to pay to reduce the entire domestic product of the territory covered.

Q. These differences between export and inland rates are unnecessary to-day, are they not?—A. Yes; I have the rates to-day if you want them.

Q. We would like to have them.—A. Using East St. Louis and Chicago as the points for eastbound traffic, the rate on domestic to Newport News, Norfolk, and Baltimore, except on corn and corn products, is 20 cents, and on corn and corn products 18 cents; for export, the rate on corn, wheat, barley, and rye is 13½ cents from East St. Louis. From Chicago the domestic rate on grain and products is 17 cents, and on corn and corn products 15 cents; for export, corn, wheat, barley, and rye 12½ cents, and on oats 14½ cents. To Philadelphia, the rate on domestic, the same proposition, is 21 cents from East St. Louis, corn products 19 cents; export, corn, wheat, barley, and rye 14 cents, and oats 16 cents. From Chicago, domestic 18 and 16; export, 13 and 15. To New York, domestic, from East St. Louis 23 and 21; export, 15 and 17. From Chicago, for domestic, 20 and 18; export, 14 and 16. That was the situation in effect September 18, 1899.

Q. Do you think at the present time there is any occasion for this difference as between export and domestic?—A. Not so far as the shipper is concerned.

Q. Is flour included in that?—A. I have a statement as to flour, which I would like to put in as a whole, with your permission.

Q. You may read it.—A. (Reading:) "The development of Gulf ports has caused a reduction in grain rates from the West to Atlantic ports and to Gulf ports far below the rate on grain to the same ports for domestic consumption, and, strange to say, the rate on flour and grain products for exports has not been reduced in the same degree, so that for the past year or more there has been a grave discrimination against American flour in favor of wheat. The difference between export flour and wheat rates to the seaboard for export, effective September 18, 1899, is as follows:

| | Flour. | Wheat. | Difference in favor of wheat. |
|--|--------|--------|-------------------------------------|
| | Cents. | Cents. | Cents. |
| From East St. Louis, when from beyond, to— | | | |
| Baltimore | 20 | 13½ | 6½ |
| Philadelphia | 21 | 14 | 7 |
| New York | 23 | 15 | 8 |
| Boston | 23 | 15 | 8 |
| Portland | 23 | 15 | 8 |

"The miller loads the flour, the grain shipper loads the wheat; elevator charges on export wheat are included in the inland rate; seaboard charges are always included in the export flour rate. Export flour can be loaded to the marked carrying capacity of the car. The millers will gladly accept an export flour rate based upon cars being loaded to marked capacity of car. It was demonstrated in testimony before the Interstate Commerce Commission taken June and July, 1899, that if present relative rates between flour and wheat are continued our exports of flour, in proportion to exports of wheat, would be largely decreased.

"Exports of wheat as compared with flour, 5 years, ending December 31, 1898, were:

| Year. | Wheat. | Flour. |
|------------|-----------------|-----------------|
| | <i>Bushels.</i> | <i>Barrels.</i> |
| 1894 | 88,415,230 | 16,859,533 |
| 1895 | 76,102,704 | 15,268,892 |
| 1896 | 60,650,080 | 14,620,864 |
| 1897 | 79,562,020 | 14,569,545 |
| 1898 | 148,231,261 | 15,349,943 |

"Wheat exports, 1898, were 67 per cent greater than in any year for the past 5 years, and show an increase over 1897 of 85 per cent. Flour exports for 1898 were 9 per cent less than 1894, and show an increase over 1897 of but 5 per cent. American millers claim that flour exports would have increased in the same degree as wheat but for the discrimination against flour made by American railroads, in transporting wheat far below the rate charged for transporting flour."

In connection with my testimony I desire to submit as part of the same a decision of the Interstate Commerce Commission on export and domestic rates, decided August 7, 1899, calling special attention to the following clauses of that decision. (Reading:)

"The profit to American millers in manufacturing flour for export is from 1 to 3 cents per 100 pounds; but the freight rates on wheat and flour show a difference in favor of the English miller of from 4 to 11 cents per 100 pounds, and, other things being equal, such discrimination is clearly prohibitive on the American manufacturer. The published railroad rates on both wheat and flour for export have been the same up to a recent period, and the carriers have exacted such rates except where lower rates on wheat were induced by competition. Water competition on the Great Lakes limits rail rates to the various ports on both wheat and flour during the navigation season, and to a degree before the opening and after the close of navigation, and the published and actual water rates on wheat have been from 2 to 4 cents lower than those on flour. To a limited extent the cost of service may be greater in the transportation of export flour than of export wheat. The export rate on flour includes delivery on board ship, while the rate on wheat ordinarily does not, and at New York an additional charge of about 14 cents per bushel for loading wheat is made. Exportation of flour has steadily increased, but for the last 6 years the increase has not been marked, and a decrease is shown by comparing exports of 1894 with 1898."

Rates through Gulf ports and generally South Atlantic ports on wheat include elevation at seaboard and 15 days free storage, which seems to have not been clearly proven to the commission.

Based on the foregoing, the commission held:

"1. That public policy and good railway policy alike seem to require the same rate on export wheat and export flour, but the duties of the commission are confined to administering the act to regulate commerce, and in view of all the conditions shown in the investigation the somewhat higher rate on export flour than on export wheat is not in violation of the statute.

"2. That the published difference in rates is too wide, and that the rate on flour for export should not exceed that upon export wheat by more than 2 cents per 100 pounds.

"3. That the relations of rates on domestic shipments of flour and wheat are not involved in this decision, as the export and domestic freights are handled under different conditions."

The decision was rendered on August 7, sixty days ago. An advance has been made on both grain and flour rates, east bound, since that date, but no attempt has been made by the railroads to comply with the order of the commission, and so far no railroad has signified its intention to obey the order, and under the present law I doubt if there is any legal process by which the millers or the Interstate Commission can enforce the railroads to obey it.

The United States has from the beginning fostered American industries in assessing its import duties, and if there is any law that can be enacted that will prevent the discrimination of American railroads against American millers, in relative rates on wheat and flour for export, it will in my opinion prove valuable to American industries, to the wheat producers, and of general value to all American interests.

Q. What, in your judgment, is the reason for the continuance of this very wide discrimination against flour?—A. The answers given by the railroads are with reference to the difference in cost. If that be true all their domestic rates are wrong, for all their domestic rates in the territory north of the Ohio and east of the Mississippi are the same on wheat and flour for domestic consumption.

Q. The same from Chicago to New York?—A. The same from Chicago to New York and from any inland point in New England. Not only is that true, but the flour for domestic consumption is not loaded to the full marked capacity of the car. A carload of flour is 21,000 pounds. The carload effective the 1st of July is 30,000. For export, flour can be loaded as heavily as wheat, to the marked capacity of the car. In addition to this difference in inland rates you must remember the flour has also to pay a higher ocean rate, which the miller expects to a certain extent, because the flour can not be loaded as readily as wheat in the steamers. So it does not show the total discrimination in favor of wheat as against flour.

Q. As an actual fact, the shipment of flour from our inland points, like St. Louis and Chicago, to Europe is relatively much more expensive than the shipment of the grain out of which the flour is made?—A. You mean more expensive to the carrier?

Q. No; more expensive to the shipper.—A. Much more so; yes. It will average as much as 13 cents a hundred.

Q. Have you any idea as to what the effect of that will be if it is persisted in?—A. In a conversation with Governor Stannard, the largest manufacturer of flour at St. Louis, he stated he had been practically out of flour export for 60 days, and if present conditions continued he would be out much longer; that the millers could not stand this situation. That is felt to such an extent that the Millers' Association is now arranging for a meeting in Chicago to prepare an amendment, a proposed law on this subject. That meeting will be held some time next month.

Q. You speak of the rates north of the Ohio. Does that include Newport News, Baltimore, and Norfolk?—A. Yes; it includes the South Atlantic ports, the territory commonly called the "official classification territory," the lower port of Norfolk up to and including Montreal.

Q. Does that territory include the Southeast; New Orleans, say?—A. Yes.

Q. You say the rates to New Orleans and the Gulf ports affect the Atlantic seaboard rates. To what extent do they affect them?—A. The largest grain-producing States are Nebraska and Kansas, I believe, Iowa, Nebraska, and Kansas, particularly of corn. The rates on grain from Illinois south to Kankakee and New Orleans at the present time is 12 cents per hundred for export. That would naturally make the rate from the same territory to the South Atlantic ports. The average difference in the ocean rate is about $4\frac{1}{2}$ cents per hundred; that is, the ocean rates are $4\frac{1}{2}$ cents lower at Atlantic ports than at New Orleans and Galveston under natural conditions. Of course, this varies with the demand for tonnage. Every rate from west of the Mississippi River up to the Platte River, to a certain extent the north line of Nebraska, is affected by the Gulf competition; that is, more or less of all grain that originates west of the Missouri River and south of the north Nebraska line, and in Iowa west of Des Moines and south. The Chicago, Burlington and Quincy, leading from Des Moines to Omaha, is affected by Gulf competition, and all of Illinois on the line of the Illinois Central only; that is, I mean it is the only business which does actually move south from Illinois that affects other territory to a very great degree. Prior to the opening of the Gulf ports, prior to 1889, immediately at the close of navigation at Chicago, the rate on corn to the eastern seaboard was advanced to 25 cents per hundred pounds. The rate I have just given you for export is considerably less, and the rate has not advanced to the eastern seaboard within the last five years after the close of navigation.

Q. By reason of Gulf competition?—A. By reason of Gulf competition.

Q. Has that business through the Gulf ports increased to your knowledge during the last five years?—A. Very greatly. Galveston has increased in grain more than 1,000 per cent in the last five years.

Q. Is the same relation observed between the export rates and the inland rates from these Gulf ports?—A. A much greater difference. The rate from Kansas City to Galveston for export on wheat and oats is 15 cents; on corn, 13 cents, and on rye and barley, 16 cents. The local rate to Galveston is 37 cents, and to New Orleans it is 19 cents; not so great to New Orleans.

Q. Do you know of any reason why there should be so much greater discrimination between those two Gulf ports and the Atlantic ports?—A. Nothing, only the

traffic reason that the railroads do not consider the export great enough to pull down their business. These export rates are all published.

Q. How are the export rates to the Gulf ports as between flour and wheat?—A. The differences are not so great at the Gulf ports. At St. Louis they do not reach the Gulf ports except occasionally at New Orleans. New Orleans, Pensacola, and Mobile are principally export points to Cuban ports.

Q. (By Mr. CLARKE.) The route for export is Newport News?—A. Newport News and Norfolk very largely. We do more from these ports than others. We do export quite a little from New Orleans by way of large lines.

Q. (By Senator MALLORY.) The rates observed by railroads are all published regularly, are the not?—A. A great many are not published.

Q. What I want to get at is this, whether the rates that are published as rates of railroads are always observed in their dealings with shippers?—A. No.

Q. Are they ever observed, in your judgment?—A. Yes; they have been reasonably well observed this year. I do not think, with the exception, possibly, of grain and grain products, the packing-house products, and possibly a few other commodities of large volume, of that nature that rates have been different from the published rates this year. And even in these cases the discriminations have been by manipulations such as I have referred to, in Chicago, by divisions of rates, or manipulations of that nature, and by allowances to elevators. That is one of our worst forms of discrimination.

Q. Will you explain that?—A. One of the methods of allowances to elevators is where a certain large grain-producing road has 1 or 2 favored firms who have a large number of local elevators along the lines of these roads. Those elevators are allowed an elevator allowance of, say, from one-half to $1\frac{1}{2}$ cents a bushel for gathering this grain and shipping it at such times as the railroads can take care of it. That is supposed to be the reason it is given. I recall one line that has an elevator at Kansas City and a number of elevators at local points. The Kansas City elevator is allowed three-fourths of a cent a bushel to unload grain from that line promptly when it comes in over that line. When it comes in the country elevator is allowed three-fourths of a cent a bushel for collecting that grain and holding it until the cars can be gotten to these elevators. The owner of that elevator is one of the largest exporters in this country. He also has this opportunity at Chicago, by billing for export and then distributing it wherever it is most satisfactory. The rival buyer at that station is soon out of business, for he must sell his grain to this man.

Q. Why can he not build his own elevators?—A. He could build the elevators, but he can not get the railroad company to make allowances. These elevators would not make a reduction to this firm, for this firm did not have a contract for the exclusive business over the line.

Q. Then, it is through preference on the part of the railroad that this particular elevator man is enabled to carry on his business?—A. It is through that that he is enabled to force his competitors out of business in that particular line.

Q. (By Mr. COXGER.) Is it your idea, then, that St. Louis is discriminated against in favor of Chicago by this system of elevators that you have been describing?—A. Yes; St. Louis is discriminated against. It happens to be; but I do not mean to say that Chicago is the only point that has this method.

Q. St. Louis has it as well?—A. St. Louis has not; but a method of this nature applies to a number of Chicago points. All points taking a hundred per cent rate are Chicago points; that is, a hundred per cent of the Chicago and New York rate. Those discriminations exist down as far as the St. Louis district, as Beardstown.

Q. Does this system enable the Chicago elevator man to reach out into the territory for grain and ship it to Chicago that would naturally go to other grain-distributing points like Omaha, St. Louis, and Kansas City?—A. It enables the Chicago firms to control 85 per cent, very nearly, of the export business of the points.

Q. I have heard it said that in certain portions of Nebraska where the grain would naturally go to Omaha, Chicago operators come into Nebraska and pay a cent or 2 cents more a bushel than they did in Iowa, a point nearer Chicago. Do you know anything of that nature?—A. Mr. Counselman testified before the Interstate Commission that he was paying for western grain at the Mississippi River three-fourths of a cent more per bushel than the market price in Chicago—for August corn; that he was doing this for the reason that he exported it at a profit in doing so.

Q. Your idea is that he was able to do it because of this export rate?—A. Not only the export rate but by the manipulation of 1.8 cents per hundred in the rate between the Mississippi River and the Chicago point—1.8 was eliminated from the profit by manipulation.

Q. (By Mr. CLARKE.) Mr. Counselman and his company are the owners of the terminal elevators at Chicago in connection with Rock Island?—A. I was going to say that I do not care to specify names.

Q. This came out somewhat in connection with the work of the subcommission west?—A. There are 4 other firms of the same nature in Chicago.

Q. There were about 9 brought out in the decision of the court there; and does not what you say with reference to this matter apply to all terminal elevators in Chicago?—A. Yes; each one of these elevators is favored by the same particular line.

Q. Is it not true that these terminal elevators are owned very largely by this railroad company?—A. Yes; that is true of the Counselman elevators, and I suppose of all others.

Q. They have the favors that are granted?—A. Yes; he rents them.

Q. (By Mr. CONGER.) Just a question or two further on another subject, and that is in regard to these differences in freight rates on wheat and flour. I think you have testified that the difference the railroads have been charging has ranged from 4 to 11 cents, have you not?—A. That is correct.

Q. Could you state from what point of those elevators this difference is made?—A. Well, that 4 to 11 cents was brought out in testimony before the Interstate Commerce Commission. Those tariffs were then in effect. The tariffs were all changed on September 16. They have been changed twice since that hearing; and while there are doubtless some differences made, the miller in St. Louis who would buy at the local station in Missouri would pay the local rate into St. Louis; he would pay 1½ cents bridge toll on his flour, and then he would pay the East St. Louis rate, so it would make 11 cents. There are a number of cases where that still applies on the large volume that the miller actually buys. My quotation was from the actual tariff paid from East St. Louis. All our rates in East St. Louis start from the east bank of the river, and we must pay the bridge toll to get over.

Q. Do you know if the Minneapolis millers have to contend against this discrimination?—A. The Minneapolis millers at the time of the hearing had 1½ cents on export for domestic flour. That has been withdrawn, so unless they have the same basis through the Canadian Pacific or through the "Soo" they are still doing that. The Minneapolis millers have an advantage over the millers further south; over districts that are not amenable to the commission.

Q. (By Professor JONSSON.) I would like to ask if it is possible for St. Louis to compete with Chicago, owing to the railroad facilities that Chicago has in this connection?—A. St. Louis has as good railroad facilities as Chicago. She has not as good water facilities.

Q. These great terminal elevators are located in Chicago?—A. We have some elevators there, but they do not belong to the railroad. I want to say our condition in St. Louis has been improved in relation to Chicago since this hearing, as it should be. We are not in as bad a condition as we were some time ago. The condition against us now is about only half as bad as when this hearing was had.

Q. (By Senator MALLORY.) Do you not think there always will be some difference in favor of Chicago, in view of its location?—A. There will be, always, in view of the volume of tonnage.

Q. It has a very decided water transportation during many months of the year, which St. Louis has not?—A. Yes.

Q. Do you complain of the fact that the elevators are owned by the railroads, or do you complain of the abuses that result from it?—A. I was not testifying by way of complaint; I was simply giving the situation as it exists. The elevators that are not owned by the railroads—frequently discriminations are just as great as where they are so owned. Now, in this Kansas City proposition that I gave the elevators are owned by a private company. The abuse is in allowing large shippers such an advantage that it throws the business naturally to one or two firms, who by agreement among themselves can pay their own prices just sufficiently above the other rate to prevent the man who has no rate from competing with them. That is where the injury, as I see it, is to the producer, as well as to the man who tries to buy against the large dealer.

Q. Well, along the lines of road, for instance, where the private companies have been building elevators, do you not think it is a good business proposition on the part of the railroads to build them in order to concentrate their shipments of grain?—A. I think so. I think that was particularly necessary on some of the northern lines at the time they were built, for the reason that they could get no private companies to do so.

Q. Is it a fact that the farmer who grows the grain is practically compelled to sell to the elevators where they are owned by private individuals as well as where they are owned by the railroads, and sell at their prices?—A. 1½ cents a bushel is more than the average profit, and so long as the elevator company pays a little inside of that freight rate it can pay a higher price to the farmer than he can ship it himself for; consequently he is practically compelled to sell to the man who has the rate.

Q. Has the farmer any redress in that case?—A. I do not see that he has.

Q. He is obliged to sell his grain to the elevator, and the very existence of the elevator makes it necessary not only for him to do so, but also, if I understand the proposition correctly, affords him a better price than he could possibly dispose of it for in any other manner?—A. You understand that there are very few points where there are not 2 elevators, or 2 shippers, one being a large shipper and the other being a smaller shipper; or, in another case, there are 2 shippers, both buying from the farmer, but one shipper sells to the large dealer, for the reason that his prices are higher than anyone's else.

Q. (By Mr. CLARKE.) Does it make any difference whether one or a dozen buy?—A. It does not make any difference, if all could sell to this one firm.

Q. (By Mr. RATCHFORD.) What remedy have you to suggest, if any?—A. I think I have got that under the proposed changes in the interstate-commerce act. I think I cover that.

Q. (By Mr. A. L. HARRIS.) What is the effect, after the independent buyer has been driven out along the line of the railroad, on the price of grain to the farmer? In other words, does the same condition of affairs exist now as existed when Mr. Counselman bid for wheat, where there is no competition now?—A. My answer would be general on that proposition, that a buyer will never pay anything more for what he buys than he is compelled to, and he will pay just such a price as will enable him to get the business and to keep his competitor, who has no rate, from getting it.

Q. Well, after the competition is driven out, does that condition of affairs then exist, that he pays what he pleases?—A. Well, I would say it would be injurious to the man who had grain to sell, by reason of his selling for lower prices.

Q. Then the farmer can not expect a continued higher price for grain after the business goes into the hands of a single buyer?—A. No; but the buyer will be continually held down by the difference between his rate. There is always some buyer left who would be in that territory for the best prices based on public traffic.

Q. Well, is not the independent dealer handicapped?—A. He is handicapped to the extent that the elevator owner or preferred buyer would know his rate.

Q. If the independent buyer along the line of a road consigns his grain to Chicago, is there a public warehouse that he can consign it to and get this same wheat?—A. There are a large number of commission men and a number of public warehouses. There is a question as to the public warehouses in Chicago being in reality private warehouses that I am familiar with; but there are public warehouses there to which grain can go.

Q. Are they controlled by the same person that controls the private warehouses?—A. Yes; that is my understanding.

Q. Then is there any danger of mixing grain, mixing a lower grade with a higher grade to bring the two up to a higher grade, that will give an advantage to a private buyer?—A. The grain that goes into a public elevator goes in there and never comes out a higher grade than the inspector will permit to go through as the class of grain that is being inspected out; in other words, I think all grains become one grade; that is, become two or three grades. Of course, the danger you speak of exists in any elevator. That is understood. That is not a proposition where I think the shipper is injured, because he sells his grain on the market basis; upon what it actually is. If it is a higher grade, we will say No. 2 wheat, the grain mixer will pay a higher price for it than if it was a barely No. 2, for the reason that he wants it to grade up his low-grade wheat; consequently I do not think that particular proposition is injurious to the farmer.

Q. Will not No. 2 wheat sell for the same whether it weighs 58 pounds or whether it weighs 62 pounds?—A. No; it will not on the St. Louis market, and I do not think it will on the Chicago market.

Q. I am speaking with regard to the farmer. Then, they may sell 58-pound wheat the same as 62?—A. I imagine he does. The high-grade wheat is bought to bring up the low grade.

Q. (By Mr. CONGER.) This evil of mixing grains, though, would militate against the independent buyer, would it not, if not against the seller?—A. I do not think the mixing of grain injures anybody but the man who buys the wheat for use, and probably the farmer who gets no better price for his high-grade wheat than for poorly graded No. 2.

Q. You said a moment ago that you thought the purchaser of the grain at a local station would pay a higher rate for it if it was an extra quality. Tell me what the object would be for the independent buyer to pay more for that grain that is a little better, if it is to go into the public warehouse and come out just equal to that grade?—A. Oh, I either misunderstand your proposition or you misunderstand my answer. I had referred to the independent shipper into a market. There are grain mixers at every

market; also professional mixers. They are there to buy this grain as it goes on the market. They will buy it from Armour or any large shipper the same as anybody else. They pay for sound wheat a certain price under the No. 2; say it is 55-pound wheat—some is as low as 50; occasionally then they will pay for wheat that will grade higher than No. 2, which is 60-pound—they will pay higher than the No. 2 price, as sample wheat. That grain goes to the mixing elevator and is mixed and then sold.

Q. Do I understand that this mixing is done in the small elevators at the country stations?—A. It is done at both places, but usually in the city. There is some mixing at the country stations, but they do not get enough variety of wheat, enough classes of wheat to mix at the country, and it has to go to the large center to get the different varieties to grade it up or down. If the mixing is to be done in the city by the public elevator man or the private elevator man I can not see what the purpose or object would be for the independent or small buyer to pay more for this grain if it is going into this public elevator and the benefit goes to the man who does the mixing. The proposition is that the buyer who buys on the market pays more than he would for simply an average grade.

Q. (By Senator MALLORY.) To go back to this matter of private elevators. I understood you to say that there were no railroad elevators in St. Louis. You mean by that to say there are no elevators that have these preferences shown them or given them?—A. No. Unfortunately, that is brought about by local conditions; by the bankruptcy of our elevator system there.

Q. They have none in St. Louis of that kind?—A. Two of the railroads are part owners of the Consolidated Elevator Company, which is now in the hands of a receiver. A few years ago the elevators at St. Louis were all consolidated into one company. Prior to that time the Missouri Pacific owned one, the Burlington one, and, I think, the Wabash one. Those elevators were sold to this central company, and each seller took stock in the central company, and that company has been in the hands of a receiver, and the receivership has just been foreclosed to the new company organized to take care of it.

Q. Is that practice of giving certain elevators the preference in rate on the published rates indulged in generally?—A. I have no idea that it has been indulged in at St. Louis. I do not want to be understood as saying that.

Q. What I want to get at is whether that is the general practice now.—A. That is the general practice of moving the grain through.

Q. So much so now that it may be laid down as general in the grain-shipping business?—A. Yes.

Q. That certain elevators are gradually getting the benefit?—A. Certain elevators and certain large shippers.

Q. Certain large shippers?—A. Most of these large shippers, instead of owning elevators, buy from the people that are located along the lines, and in that case the rate is made through a manipulation.

Q. Now, with regard to the question of freight rates in general, have you any criticism to make on the published freight rates of the United States generally? I mean those which are held up to the public. Are they exorbitant?—A. Not generally so; no. I do not think the rates generally charged in this country are, taking the rate within itself, exorbitant.

Q. Do you know how they compare with the freight rates on the Continent?—A. The general rates in this country are far lower than they are in European countries. That is the only thing that brings down the general rate proposition—the length of the haul in this country. Our local rates for short distances are higher than they are in Europe.

Q. The average rate is lower?—A. The average rate is lower.

Q. But the local rates are higher?—A. The local rates are higher.

Q. Have you any idea what is the percentage of excess on the part of the American local rates?—A. No, I have not. I made a comparison some years ago, but it would be out of date now. I did not figure up the per cents even then.

Q. What is your observation as to the observance of the long and short haul rule by the railroads that you have intercourse with?—A. It has never been obeyed in the territory south of the Ohio River and east of the Mississippi River. It has not been obeyed since the Troy decision. Rates through the Southeast have never been on the basis of the long and short haul clause; but I can tell you how they are made. The rates through the Southeast are made on a combination of locals through to a junction point. For instance, the rate to a given point between Atlanta and Macon, Ga., will be the rate to Atlanta plus the local rate out of Atlanta to that point; and the rate to Macon plus the rate back to that point is less. Whichever is lower will be the local rate to that point. You will find the rates from all territories north of the Ohio River and

east of the Mississippi are lower to Savannah, Charleston, Jacksonville, and Port Royal than they are to any intermediate point. They will be lower to Augusta than to the first point north of Augusta.

Q. (By Professor JOHNSON.) Why is it that the Southeastern section has always adhered to this basing point system?—A. The local conditions in the South are so different from those in other parts of the country, particularly on account of the water competition. The Southeast has a coast line all the way round from New Orleans up to the Virginias. It requires a different classification and a different method of making rates. What its effect on the man at a local station is I am unable to say. There are two sides to that proposition. He pays the higher rate on his through business, but the question is whether the commission or jobbing house does not pay a lower one than it would if all were brought down to a level. Which is correct I am unable to say. The railroads maintain that the present condition is better for the shipper as well as themselves.

There is another discrimination, more particularly in reference to the Ohio River and the territory of the Southeast. The merchandise rates through to the Eastern seaboard and all the Southeast are lower than they are from our territory. A few years ago, after the rate war, in trying to arrive at a division of the business, it was found that the most of their business into that territory in the way of merchandise went there from the East, and that most of the provisions went there from Chicago and across the Ohio River and through Memphis. They so adjusted those rates as to force in a measure the provisions from this territory where they naturally originated and force merchandise other than iron articles from the Eastern seaboard. The consequence is that the boot and shoe dealers and general merchants of Chicago, St. Louis, and Cincinnati are at a disadvantage as compared with the merchants in the East to all territory east of the Mississippi line and east of Kentucky. That matter has been before the Interstate Commerce Commission four different times and has been decided in favor of the Cincinnati Freight Bureau and the Chicago Freight Bureau, and two of the cases were appealed to the courts and one of the cases decided in favor of the complainants; but still it has never been obeyed from that particular point. That was the Social Circle case.

Q. (By Senator MALLORY.) What is your judgment as to the local rates that prevail in your territory and in the Southeast generally, as to their being reasonable or otherwise; the rates that are not between terminal points?—A. The local rates in Illinois reached by us—that is, immediate local rates—are governed by the statute of Illinois and are not unreasonably high.

Q. Are they observed?—A. Generally speaking, yes; although there is nothing in the statute that would prevent them from being cut if competition required it. There is a pool in the State of Illinois on these rates paid there.

Q. Railroad pool?—A. Yes. I say it is a pool; it is a tonnage division business that holds up competitive traffic.

Q. How about the rates in this other section; that is, in your jurisdiction?—A. I do not know of any rates that are injurious. That is, I do not know of any rates so high as to be injurious to the people. There are a great many that are so adjusted as to be injurious, for the reason that some other cities have a lower rate or a lower basis, but whether the rate within itself is too high I am unable to say.

Q. Well, relatively?—A. Relatively there are a great many rates that are out of line.

Q. What is the motive for that discrimination?—A. Well, it is from various causes. One of the causes which has given the most trouble in my office for the past 6 months has been the desire of the railroads to secure business that did not legitimately belong to them. I had a condition on the Missouri River, that will expire on the 15th of October, whereby rates from all points in the East, beginning with Portland, Me., on the north and Norfolk on the south, extending as far west as Pittsburg and Buffalo to the Missouri River, by way of Galveston, and worked from Galveston on to Missouri River points, as low as rates from Chicago to the same points, as low as the rates from the same territory to St. Louis, when you count the bridge toll, added to our East St. Louis rate. That is in a way to be remedied now, by order of the judge of the United States circuit court. The line that was making the rate being in the hands of a receiver, he decided the rate in effect from the Eastern seaboard would be too low and ordered it advanced. If there had been no receiver, or if the receivers had not applied to the court for relief, I do not think we would have had any.

Q. You have had some experience with the classification of freight?—A. Yes.

Q. Will you state to the commission the salient or distinguishing features of the different classifications that you are acquainted with?—A. There are 3 different classifications in the United States at the present time. Within the last 15 years there were 20. At the present time all the territory east of the Mississippi or north

of the Ohio, including the Virginias, takes the official classification, and the territory west of the Mississippi River, including as far as the Pacific coast, takes the Western classification. The territory south of the Ohio and east of the Mississippi takes the Southern classification. The State of Illinois has a classification within the State established by the railroad commission. The State of Iowa has one established by the commission. Those classifications are as near the same as the standard classification in the territory as in the opinion of the commission is best; that is, they make a number of commodity exceptions. The lowest classification, taking into consideration the principal classes, is the official. They only have 6 classes. The Western is much higher on general merchandise and lower on the products of the country. The Southern is very largely an any-quantity classification, for the reason that I just gave—on account of water competition. It has been a theory among shippers that a uniform classification was an absolute necessity. I do not believe a uniform classification without a great many commodity exceptions is a possibility.

Q. Why?—A. The territory in which an article is produced in quantities must naturally have a lower rate on those commodities to the central markets than where those commodities are consumed in much smaller quantities, of course. For instance, in your territory, the southeast, cotton piece goods are fifth-class in the classification, in the third-class of the official classification, and the first-class in the western classification. It may be that the western should be as low as third, but I do not think it should be as low as fifth. Otherwise it would bear its full share of the traffic burden on all traffic of that class shipped in the territory. The western classification is very largely to the consumer and to the retail dealer or jobber for consumption, while in the manufacturing districts it goes to the central markets for redistribution. The same proposition applies on iron articles. Take the Birmingham district—the freight rate on iron should vary with the price of pig iron, between the minimum and maximum rates. In other words, as the price of pig iron goes down the rate on pig iron is reduced to the Ohio River and the Mississippi River. As it advances, for every dollar's advance there is an advance of 25 cents in freight rate until it reaches the maximum.

Q. Well, is not that feature observable in all kinds of classifications; that is, the product in a particular section is classified, whether it be manufactured or natural product, lower than in any other classification?—A. Yes. That is the reason I say a uniform classification established by any arbitrary order would be very injurious to many people. In the Pacific-coast traffic there are nearly fifteen hundred exceptions to the classification, brought about by water classification around by the Pacific mail and Cape Horn and other competition.

Q. Do you think it would be possible for any central body to form a just and fair classification to both shipper and producer for the whole United States?—A. I do not believe it could be done by anybody, unless it was the railroad people themselves, and they are doing it as fast as circumstances will permit.

Q. You spoke of a classification established by the State of Iowa and also by the State of Illinois. Do you know anything about how that works?—A. The official classification of Illinois is based upon the western classification, with the proviso that no rate shall be higher than that classified by the official. In other words, it has a low rate, and applies it except on a number of articles, such as canned goods, sugar, coffee, and articles of that kind, which are classified in one class lower than either classification markets. That is to enable the jobber in the State to distribute through the State. The Iowa classification is the western classification brought up from time to time with a few exceptions of the same nature. Now, another trouble in the way of a uniform classification is the recent statute rates that are in effect, mostly as a maximum tariff, on about 25 or 30 commodities, that are lower in some cases than either one of the classifications made.

Q. Is there any observation, in the making of classifications, of the local State business—any consideration of that brought into the classification?—A. Yes. Now, the next meeting of the western classification committee will be held in Milwaukee next Monday. I issued a circular to the members of our different committees, calling attention to that meeting, and asking if anyone had any article that was wrongly classified or that injured them by the classification now in effect. At each of these meetings there are from 100 to 500 applications for changes. The argument is presented as to the way they are needed, one of the arguments being the classification in other territory. There is a blank that is furnished. If lower than the official, you state what the classification is. There is a continuous effort to bring the classifications nearer together by the railroads themselves wherever it is possible. The differences are not nearly so great now as they were 2 years ago, or even a year ago.

Q. Can you tell whether any considerable road, in its classification, draws a distinction between its local business, the business inside of certain State lines, and

business that is interstate in its classification?—A. No; except where, in Texas, they are required by the Texas commission. As I stated a while ago, there are orders of the commission, but no road of its own volition makes a difference.

Q. If intrastate commerce is to have any weight in existing classifications, would it not be a very disturbing element in the case of the establishment of a classification by a central bureau, in Washington, which could only deal with interstate commerce and not with intrastate commerce?—A. It would be a very serious objection, and it is a serious drawback even in the making of rates as it is now. These conflicts between State and interstate laws are met with every day on all questions of traffic.

Q. (By Mr. CLARKE.) Concerning the difference in charges between local and other rates, you say they are higher for the local?—A. Yes.

Q. Is it not true that the relative labor cost of handling local freight is greater than that of handling through freight?—A. Yes; it costs no more to load a shipment to cross the continent than it would to load it to go 10 miles. It costs no more to unload it at destination in either case. Consequently, the greater the load the lower the proportionate expense of transportation. I did not intend to be understood as claiming any serious discrimination on this proposition. The differences are great; whether they are too great I have not made sufficient investigation to say.

Q. You say also that the local rates in this country are higher than they are in Europe; still the through rates are lower?—A. Yes.

Q. Is not that difference accounted for largely by the labor cost?—A. I think that enters into it quite extensively. It is very difficult to compare our methods with the European methods anyway, for their methods are so different in handling traffic from ours. In England transportation covers store-door delivery in every case; that is, on ordinary merchandise. They furnish wagon transportation within the city, while with us, there are only a few points where that is true, and even then only in a few territories.

Q. Is it your understanding that the wages of the railroad employees are higher in this country than in Europe?—A. Very much so.

Q. Now, I would like to bring your attention to the difference between the export rates of flour and wheat. If I understood you, you testified that the local rates by rail in this country for consumption in this country are the same on flour and wheat?—A. In a great part of this country they are, yes.

Q. But the export rates are widely different, and you think that difference is too great?—A. Entirely so; yes.

Q. Now, what, in your opinion, is the cause of that excess? Is the difference made by the railroad companies or by the steamship companies?—A. My testimony covered only the railroad rate to the seaboard. There is a difference still to be added growing out of the steamship company's rate. The steamship company usually charges more for flour than wheat. The difference in the inland rate to the seaboard is where the discrimination exists, as I see it, against the American miller. The American miller will ship as much flour in a car for export as the American wheat shipper will ship wheat, in hundreds of pounds. The elevator company loads the wheat. At Gulf ports and at some of the South Atlantic ports the railroad company pays the elevator charges to get it aboard steamer. They also put it aboard steamer in the case of flour. Now, I can not see, other than the insurance risk, where there should be any difference between flour and wheat under those conditions. And I think the commission's decision that 2 cents would be a reasonable difference is certainly all that the wheat shippers should ask, or all that the railroad companies should ask, for the difference in transportation.

Q. Does it seem to you therefore that the difference, as made by the railroad companies, is practically dictated by the steamship companies?—A. No; the difference is made because you can get a large quantity of wheat to move out almost any moment. You can not get a large quantity of flour to move at the same time. Flour moves, a steady movement, say, of from 1 to 10 and 20 cars a day. You can go into St. Louis or Chicago to-day, and if you make a low enough rate you can get a contract for almost any quantity of wheat, but you can not do that for almost any quantity of flour. It is a question of competition between carriers that has brought about this situation.

Q. And you say you think the difference is excessive?—A. Yes.

Q. Who dictates that excess? A. The carrier.

Q. Which carrier?—A. The inland carrier.

Q. Why?—A. Wheat and flour, going east go very largely at times when empty cars are on the Mississippi River and in Chicago to go east. In other words, it is to get a return load. The elevator company, as I say, has the grain and can get those cars to come back quickly. The flour shipper does not carry a very large stock of flour on hand and has to grind his flour very frequently after he makes his sales.

Q. That explanation would seem to account for a reasonable difference, but I can not see that it accounts for an unreasonable difference?—A. Well, the unreasonable difference is brought about by the anxiety of the outside railroad man to get business.

Q. (By Mr. FARQUHAR.) Is not there a reason in the fact that the foreign miller gets the advantage of the by-product in the grinding of the flour?—A. On the contrary, the miller on the other side gets better prices for his by-products than the miller on this side does.

Q. Yes; but he gets the by-product by getting the grain. If he got the flour, there is no by-product on the other side. Do you not take that into account?—A. Well, I can not see where that is of any consideration, to be considered by the American railroad men.

Q. Well, would it not be a consideration in this fact, that nearly all the tonnage is foreign tonnage that takes the American grain?—A. Yes.

Q. Is it not an advantage to the ship broker there to get the grain for the foreign miller?—A. That is true as to the ocean rate.

Q. That is the very rate that is complained of, is it not?—A. No. The rate we complain of is the rate that the railroad company makes to the seaboard on flour hauled in the same train; that he charges on flour from 6½ to 8 cents per 100 pounds from St. Louis, for example, higher than on wheat loaded about the same minimum weight. That is aside from the ocean rate. The ocean rate, of course, is largely on foreign tonnage, and the Englishman would naturally rather have the wheat ground in his country than on this side. That is so much so in foreign countries that France has a duty on flour and does not take the duty off on flour when it does on wheat. But the American miller complains that the railroad company is putting a duty on his business even where there is no duty on the other side.

Q. You stated here that the inland rates on flour and grain were the same?—A. For domestic consumption.

Q. It would seem that the American railroad makes a discrimination as well as the foreign shipper?—A. Yes.

Q. Both of them are getting toll?—A. Both of them are getting toll.

Q. Owing to the fact that they are carrying the grain instead of the ground products, the flour?—A. Yes.

Q. Now, as I understood the question, really you do not know whether it was the foreign shipper or the two in conjunction that forced the grain shipment instead of the flour shipment. Evidently there is a choice somewhere. You claim that it is in the lesser amount of flour that is in the market for the carriers. But should that lesser quantity make such a difference as to allow the American transportation line and the foreign steamship line both to get toll?—A. The foreign steamship line has a reason in the fact that package freight pays naturally a higher rate than bulk freight. The American railroad company has no excuse for this that I can see, other than the permanence with which he can get the shipment.

The millers are distributed over a very large territory. There are hundreds of mills through Kansas and Nebraska of 125 and 150 barrel capacity. They export their surplus; they sell all they can locally and export all they have left. If they can export all their surplus they can manufacture their local flour much cheaper, for the reason that they are running full capacity. I can give you an illustration that also illustrates the long and short haul proposition. A few days ago a steamer was in port at Norfolk that had 6,000 tons room. A railroad, which terminates at St. Louis, contracted at Kansas City for 3,000 tons of flour at 2 cents lower rate—this is flour, in this case—at 2 cents lower rate than it makes in St. Louis. The reason it gave was that this 3,000 tons was there ready to go. We did not have that much within ten days at all of our mills. Now, that steamer would go on demurrage at a certain time. The tonnage in sight made the rate. Now, that proposition applies on grain to a much greater extent, for the export grain business of this country is done by about not to exceed 20 firms. The entire flour business is done by 5,000 firms. Now, you can go to one of these 20 firms and get more tonnage than you can go to probably 20 flour shippers and get.

Q. (By Senator MALLORY.) Do you know anything about the difference in the import rates and the domestic rates?—A. Yes.

Q. Is not there a similar difference between the import rates and the domestic or inland rates?—A. I have known tin-plate rates to be lower from Liverpool to Kansas City than the rate from St. Louis to Kansas City. These are illustrations that have come to my mind. The rate on queensware to the Missouri River from Liverpool is frequently lower than it is from East Liverpool, Ohio.

Q. Well, do you ascribe the same reason for this difference that you ascribe for the difference in the export rate?—A. No; I think that the influence of the man on the other side makes the rate. By agreement between the railroad company and the ocean line, they deduct a certain per cent of the rate necessary to get the business.

Q. (By Professor JOHNSON.) I would like to ask whether the Mississippi River traffic has any appreciable influence on St. Louis rates?—A. A very great one.

Q. Will you illustrate the way in which the Mississippi traffic affects the rates at St. Louis?—A. We have a barge line between St. Louis and Kansas City—St. Louis and New Orleans. We have several steamer lines running more or less regularly, and those lines naturally make a lower rate than the rail lines. It is hard to estimate the exact effect of water competition, for the reason that it is not only the traffic that the water carrier hauls but all the traffic that the railroad company hauls in competition with it. We know that the rate by barge from St. Louis to New Orleans very frequently makes our rate on grain from St. Louis to Baltimore; that the rate on flour from St. Louis to New Orleans by barge frequently makes our rate to the eastern seaboard by rail. It would be impossible to state exactly what effect it has, but we know it has a very satisfactory effect. In fact, if we had the lakes at St. Louis that Chicago has, I do not think I would have any excuse for testifying for St. Louis on grain rates.

Q. Is this Mississippi River traffic increasing or decreasing?—A. As compared with several years ago, it is not so great. The barge line last year hauled very little traffic for the reason that lower rates were made on export grain than ever known before. The rate from St. Louis to Baltimore was lower than the barge line figured they could haul to New Orleans at a profit, to say nothing of the fact that the ocean rate was higher from New Orleans than from Baltimore. But taking 1899 as compared with several years ago it shows an increase.

Q. You do not expect the river traffic to be driven out of existence?—A. No; although there is one thing in the interstate-commerce act that is liable to drive it out of the inland rivers to some extent. It did drive it out on the Missouri River while I was there. The long and short haul clause itself, the exception to it, makes it more favorable to the railroad company than to the water carrier. The water carrier is usually one steamboat, sometimes two, three, or four, while the railroad company has only involved the points that are reached by this water carrier, for the reason that it can evade the long and short haul clause when meeting water competition. The consequence is that they can bankrupt the water carrier frequently and still hold up their rates to intermediate territory.

Q. (By Senator MALLORY.) Has not that to some extent been done?—A. It has been done very greatly. It did drive the Missouri River Transportation Company out of existence.

Q. Has it affected the Mississippi also?—A. Yes; it bankrupted the Anchor Line of steamers.

Q. (By Mr. FARQUHAR.) Did the establishment of your barge system make much difference in the freight rates to the East?—A. Yes, I could furnish the commission a comparative statement showing the rates when the river is up so the barge line can go down, and when it is not; when normal conditions were in effect, say up to 2 years ago, before this class of competition became such a factor. If you would like to have it, I would be very glad to furnish a statement of that kind showing the comparative rates, as an illustration.

Q. That is, it changes the eastern rate—by the establishment of the barge system?—A. Yes. Part of the year the river is closed by ice, and other times the river is so low that the barges can not run. When they can run the rates show lower than when they can not.

Q. (By Professor JOHNSON.) I would like to have your opinion as to whether the rates from the central West to the Pacific West are higher than they need be. I had, for instance, a letter this morning from Richmond, Ind., from the Hoosier Drill Manufacturing Company, in which they say that they are shipping large quantities of goods to the seaboard and from the seaboard to Pacific coast points and thereby saving nearly a third on freight rates over what it would cost them to send the same goods direct by rail to the Pacific coast. I cite that as an illustration of an actual fact, with a view of asking whether your experience in St. Louis has given you any information as to whether these rates to the Pacific coast by rail might be made less.—A. We at St. Louis have on file with the Interstate Commerce Commission a complaint on that proposition which will be heard on October 30. The rates from all the territory on the east of the Mississippi River on commodities to the Pacific coast are the same. That is, the rate from St. Louis to San Francisco on rails is the same as it is from Pittsburg by rail. This particular proposition that you speak of—where is it—Richmond, Ind.?

Q. Richmond, Ind.—A. Well, they pay a combination up to the nearest point, and that point happens to be the eastern seaboard. The Pacific coast rates are very grossly discriminatory against the less than carload shipper. They also take away from the near-by shipper the advantage of location and distance. The grounds of

our complaint before the commission are these: First, that on June 29, 1898, the railroads advanced their less than carload rates to a minimum difference of 50 cents a hundred pounds above the carload rate; and on a great many commodities the difference is greater than the profit on the goods. They also maintain the same rate from Pittsburg to the Pacific coast that they maintain from St. Louis to the Pacific coast. That complaint we have not gone into so much. That is more particularly a St. Paul and Chicago proposition, although we are equally interested. This was brought about by an agreement between the jobbers of the Pacific coast and the railroads reaching there; the agreement being that if the less than carload rates were advanced sufficiently to shut out the merchants of Chicago, St. Paul, and St. Louis, they would discontinue shipments by water on the business they controlled. A committee from those cities went to Monterey, before the hearing, and also at Milwaukee and St. Paul, protesting against this change. The change was made, however, and has now been in effect, as I say, since June 28, 1898. In May of this year the two northern lines, the Great Northern and the Northern Pacific, finding that they were not getting as much business as they thought they ought to have from the Pacific coast jobbers, reduced their difference to 25 cents a hundred; so we have the anomaly of a lower rate from St. Louis to Portland than from St. Louis to Los Angeles, and this entire situation will be brought before the Interstate Commerce Commission at hearings that we are now arranging for.

Q. Does any of your traffic destined to Pacific seaboard points go to the Gulf and thence by water?—A. No; we have at times shipped from St. Louis to New York and thence by water. There is no direct transportation from the Gulf to the Pacific coast.

Q. How recent, as far as you know, have there been shipments from St. Louis to the Atlantic seaboard and thence around by water?—A. Within the last 2 years, up to the time of the rate war between what is known as the Clipper Line of steamers and the Pacific Mail, and the direct rail lines, went out of existence—that is about a year and a half ago—we shipped lard and oleo oil and a number of commodities of that nature from Kansas City to the seaboard and thence by water to San Francisco.

Q. (By Mr. CLARKE.) Is it not true that the Southern Pacific Railroad has a line of steamers plying between Atlantic and Gulf ports and their eastern railroad termini at New Orleans and Galveston?—A. Yes; they own the Morgan line. The Southern Pacific, on eastern seaboard business—I think it was shown in testimony some time ago—handled 65 per cent of all the eastern business by way of New Orleans to the Pacific coast points; that is, as far north as San Francisco.

Q. By reason of having that line of steamers?—A. Yes.

Q. They are able to make lower rates than the all-rail lines to the Pacific, aren't they?—A. The Southern Pacific so far have been able to dictate all the rates to the Pacific coast south of Portland, and up to May 1 last making, you might say, all the rates to the Pacific coast.

Q. In that way they can get a great deal of the freight of the central West, can they not?—A. They get it, but they prefer getting it from the East, where they get the haul for their water line and their rail line also. The freight that originates in territory west of Pittsburg seeks very largely the Santa Fe, the Great Northern, and the Northern Pacific roads. By the way, I might add that in consequence of this reduction by the Great Northern and Northern Pacific roads the Pacific coast jobbers have a boycott on those lines at the present time. They are dependent upon us in the middle West to get their business from the Pacific coast.

Q. (By Senator MALLORY.) In your experience can you say that you have encountered many instances of unjust discriminations against individuals, in your official experience, by transportation companies?—A. I have encountered a great many illegal discriminations.

Q. I qualified that by the word "unjust," not illegal but unjust, whether they are legal or illegal.—A. Yes; there are a great many that occur from time to time. I think we have had as many in favor of individuals in whom I am interested as against them.

Q. Those which are in favor of some must necessarily be against others? In other words, it would not be a discrimination in favor of somebody unless it was against somebody else?—A. Yes.

Q. Have you succeeded in many cases in correcting those discriminations?—A. Our office has succeeded in correcting a great many discriminations against the city of St. Louis; and in a similar office at Kansas City that I filled for 8 years, we corrected a great many discriminations that were in effect there.

Q. That is, as against Kansas City?—A. They were published tariff discriminations that I refer particularly to. We found a condition of rates there that would, if continued, have prevented the progress of such cities as Kansas City and St. Joseph.

Q. Well, these were simply discriminations that were committed openly and aboveboard, as it were?—A. Yes; those were discriminations on published tariff.

Q. You stated in your testimony originally that you encountered discriminations in favor of individuals in St. Louis, but that with those things you have nothing to do?—A. I shut my eyes to a discrimination that is reported to me as a St. Louis proposition, for the reason that it is not policy for me, as a representative of St. Louis, to make too close an investigation. When there is such a discrimination in favor of an individual in St. Louis, it is because a similar discrimination exists in favor of an individual somewhere else. I make an investigation as to the other city, and if I can get that corrected the one in our own city is corrected at the same time. So indirectly I do, but directly I do not, take up a proposition where a St. Louis man is supposed to have a discrimination.

Q. Well, if you find that a similar discrimination exists in favor of an individual outside of St. Louis, and also in St. Louis, and you can not correct it in the other city, you allow it to go on in St. Louis?—A. I have never found one of that nature. My experience on both sides of this proposition is that when a lower rate than tariff is made it is because the line that makes it thinks it is losing business by reason of a lower rate to some other place or some other individual. If that is not the case at that particular moment it will be very soon; and matters will continue to grow worse and the discriminations will be greater as between individuals until they get so bad that the railroads will get together and put things back to a proper basis again.

Q. In other words, the evil works out its own remedy in the course of time?—A. The evil works out its own remedy in time; in the meantime some one is suffering.

Q. May I ask you what method you employ to induce railroads that are thus discriminating to correct their ways or their tariff?—A. It is owing to circumstances. Usually by calling personally upon the traffic official of the company and discussing it with him informally. In that way it is understood by railroad men that I am not a detective, nor am I going to make any report against them. Consequently they will discuss a proposition with me and give me their reasons individually that they would not either in correspondence or would not admit openly that they were doing; and they frequently make suggestions to me as to what action I can take as against what they are supposed to meet that will probably help them to correct the situation. In other words, I try to apply, in my position, the same proposition as I would if I was doing the business of an individual firm; that is, I try to apply for the city of St. Louis the same methods that I would if I owned its business and was handling it.

Q. Well, behind you, behind your personal influence, is not there also a moral influence?—A. The moral influence of more than 2,200.

Q. That of itself has more weight with the transportation companies?—A. Yes; so much so that if necessity arises I could divert a large proportion of the business that those 2,200 people control. That is the power behind my work.

Q. And these organizations, such as this in St. Louis and those in others of the principal commercial centers of this country, railroad centers, have been brought about by reason of the existence of a system of discrimination that has been going on for years?—A. They have been brought about by that; also by the fact that when the shipper calls upon the traffic men he is always at a disadvantage, for the reason that he does not know the traffic man's side of the case. The traffic man gives the situation as he pleases, and unless you are familiar with his side of the proposition you must take what he says as true. A man in my position is supposed to have been familiar with the railroad side of the case before he took the position; consequently his knowledge of the railroad side is what the shipper pays for, and a great many cases of discrimination in rates continue because they have never been brought before the roads in such shape as to convince them that there were discriminations existing. I do not think that any railroad company for any length of time upholds discriminations against a community. What they do is to look out for the greatest amount of revenue they can get for the company.

Q. You speak of Chicago and other western cities, of discrimination there by reason of the elevator system. Is there any other method, any other thing, peculiar to the Chicago transportation business, particularly of grain, whereby there is an advantage gained in Chicago over St. Louis or other cities?—A. There is a situation there that I do not know that St. Louis is particularly interested in, but by which a reduced rate is secured. It is no particular benefit to Chicago, but it is a benefit to the western shipper. That is, by the manipulation through the belt lines around Chicago.

Q. Will you please explain that?—A. For instance, there are 3 belt lines touching the western lines and the eastern lines. The belt line is allowed a certain per cent of the rate by the eastern line. It is also allowed a certain per cent of the rate by the western line. Those two percents are great enough so that the belt line can afford to give back part of it to the man who routes his business through this belt line, and

still have a profitable business. That has not been pursued as much this year as in former years. It used to be one of the greatest methods of cutting rates through that territory.

Q. In other words, there was a rebate to the shipper?—A. It was a rebate to the shipper paid by a line which claimed that it was not amenable to the interstate commerce act, because it paid it out of a proportion that accrued in the State of Illinois.

Q. (By Professor JOHNSON.) Was that position of the belt line upheld by the Interstate Commerce Commission?—A. No; they ruled against it.

Q. (By Senator MALLORY.) Have you had any occasion to consider the question of private cars and their influence upon transportation rates?—A. The private car influence is one of the methods of cutting rates. So long as they exist that can be done and still be within the law. For illustration, take any packing company. The car line is a separate corporation. The traffic manager of the packing house is usually the manager of the car line. He routes his cars so as to get the longest mileage. That is one method of cutting rates. They are paid so much a mile for the use of the cars; usually in the west it is 1 cent per mile in both directions, loaded or empty. East of the Mississippi River it is three-fourths of a cent. Now a great deal of the packing house product, in fact, the larger proportion of it, is controlled absolutely by the packer. He takes the long line; that gives him the most mileage. The short line man goes to him and agrees to allow the long line mileage if it is shipped over his line, and at 1 cent per mile or even three-fourths of a cent per mile the packer has a very nice revenue from his car department. It is also done sometimes by leasing the cars; getting so much rent for a car.

Q. Is there any other line of business in which private cars, privately owned cars, are employed to any considerable extent, besides the packing business?—A. Yes; the stock car business is the largest. The stock cars and refrigerator cars are the two largest lines of private cars at the present time. Up to 2 or 3 years ago there were a great many box cars of that nature, but they are very largely going out of existence, for the reason that about 2 years ago the car mileage was reduced by the railroad companies from three-fourths of a cent to 6 mills. That took off $1\frac{1}{2}$ miles, or about 25 per cent off the earnings, and it has reduced the number of car lines. In fact, at the present time, the railroad companies will not haul private box cars if they can haul their own. I think that eventually the private box cars will be a thing of the past.

Q. You distinguish the box car from the refrigerator car?—A. Yes; there is more reason for the existence of the refrigerator than there is for the existence of any other line, for the reason that the refrigerator has to be built peculiarly for the class of business that it hauls, and the railroad avoids some risk if it hauls the traffic in the car of the owner. That is the railroad excuse for it, and I think there is considerable to be said on that side of the proposition.

Q. (By Mr. FARQUHAR.) Generally, who are the owners of these refrigerator and stock cars?—A. The stock car lines are very largely owned, or to a certain extent owned, by officers of railroads, and refrigerators are owned, with only two exceptions that I now recall, by packers or by beer shippers—by the shippers of those products.

Q. There is not such a thing as a car trust of that character, is there?—A. The car trust, as applied to car lines, I think is a misnomer. The car trust is usually where the car belongs to the railroad company—that is, has the name of the railroad company on the car. The car trust is one of the methods of the officers of a railroad to use their money or lend their money to the railroad company at a per cent. In other words, the railroad company needs a given number of cars and has not the money to buy those cars. The officers or their friends will form a car trust and lease those cars to the railroad company. I do not think that affects the shipper at all, nor does it have anything to do with the rate of transportation. That is simply a question as between the owners of the trust and the stockholders of the company. That also applies to locomotives quite frequently.

Q. These refrigerator cars, you say, are usually owned by the packers themselves?—A. By the corporation which the packers own.

Q. That is a question which I desire to know about. It is not the immediate packer at all, but a corporation operating rolling stock, independent of the packer, but having the money control of it?—A. He has the money control and any profits. If they are organized for the purpose of evading the law, the rate paid to the car trust and the refrigerator company is not paid to the packer, for the reason that the refrigerator company is disobeying the law, if anyone. The refrigerator company is a transportation company, consequently it is a question between two transportation companies, and, so far as I recall, there is no law against it.

Q. (By Professor JOHNSON.) Now I would like to ask on this point as to what extent you think the earning of railroad companies are at the present time absorbed by these subsidiary or ancillary companies, bridge companies, car trusts, freight lines, palace car companies, etc.? Some years ago, I think, a large part of the earnings of transportation were absorbed by the corporations that were subsidiary. To what extent do you think that now exists?—A. I do not believe that I can answer that question satisfactorily to you. It is so largely a question to each particular railroad. It is entirely owing to the credit and standing of the railroad company itself. If the railroad company has not the money, or if the stockholders of the company are not willing to advance the money necessary to do this, someone must; and the officers of the company, who usually have the money, are willing to loan this money and take as security these trust bonds or trust certificates.

Q. Do you think the apparent earnings of railroad companies from the business of transportation, as manifested in the dividends on stock, would be very largely increased if the real earnings of transportation all found their way to the stockholders?—A. Well, the first stockholder of a railroad company did not put up any money for his stock to begin with. He simply got his stock for subscribing to the bonds, as a usual proposition.

Q. I suppose you are aware that a great deal is heard of small earnings of the railroad companies for the business of transportation. Are the earnings small, in your opinion?—A. In some territories; yes. The building of roads in a new territory must be on a basis that will give the man who ventures his money more than the ordinary interest, and the general method of doing that is to form your line, get all the donations you can toward building it, issue your bonds, and give probably for every \$1,000 bond that is subscribed, say, \$250, \$500, sometimes \$1,000 in stock, as a bonus, on the basis that this stock represents the donations that you give; and if your lines prove profitable the stock increases as the country is built up. That is what has increased the value of Western stocks and what has prevented some Western stocks from being any greater than they are. Now, what effect can trusts have on this proposition is something I can not answer.

Q. (By Senator MALLORY.) Any other question?—A. There was one question referred to this morning that I meant to have covered in regard to discriminations; that is the question of fraudulent representations by shippers.

Q. As to classes?—A. As to classification. Usually speaking, where this is very great it is by the knowledge of some railroad men. The railroad company could prevent it if particularly anxious to do so. I suppose Mr. Kelley probably covered that yesterday pretty fully, inasmuch as he and I have been working on the same cases in Texas and the Southeast.

Q. He referred to it. Is that, in your judgment then, an evil, to a considerable extent?—A. It is a very great evil in some particular lines of business. We have felt it more at St. Louis on this particular line of hardware than anything else, because the difference is so great between carload and less than carload rates to the territory in question, particularly in Texas. The difference on iron articles is 40 cents per 100 pounds, and on nails 35 cents, and on another class of iron, galvanized iron, 36 cents. The shippers who load a mixed car of 30,000—up to the 1st of July 24,000 was a carload—putting in nails, sheet iron, ordinary iron articles—that is, merchant iron—gets 40 cents less than the man who ships to the same city in less than car loads, and it puts the man who ships in less than car loads at a very great disadvantage; and we have spent a great deal of time—the cities of St. Louis, Chicago, Cincinnati, Philadelphia, and other cities—in trying to have this stopped. We do not have much trouble of that nature west of the Mississippi River, for the reason that the Western Weighing Association inspect at all points west of us. The trouble that we particularly refer to comes in Texas and the Southeast, where no such associations exist. There was an association for a while in Texas, but it is not there now.

Q. You think that a system of inspection would make that thing impossible?—A. The railroad companies themselves could correct that proposition if they would pursue the same methods in all territories as they do in the South. The temptation is quite great in a good many commodities.

Q. (By Mr. FARQUHAR.) What have you to say on the question of underbilling?—A. That is part of the same proposition that I made there. Underbilling can not be pursued if the railroad companies do not want it. It is not pursued in the territory west of Chicago and west of St. Louis, and this inspection bureau that I speak of is also a weighing association. They weigh all traffic not as individual railroads, so there is no temptation for their employees to give other than the correct weights. One of the troubles of having the inspector of the railroad inspect for himself or the weighmaster for himself is the temptation to secure the business by under-billing or misrepresentation of the contents. When that is done by an association of railroads

the inspector is the employee of no one individual road, and he hold his position by being correct instead of the reverse.

Q. So that it needs the collusion of the officials of one or two roads, on any long haul, to make a technical underbilling?—A. Yes.

Q. And you say this inspection at the origin of the bill itself would obviate any collusion even on the part of the other roads?—A. Yes; this inspection, as applied in the territory I speak of, is not only at the point of origin, but it may be at any point between origin and destination. It may be when you bill out your freight that the railroad has no time to put either inspection or weight. It notes on the bill, "Shipper's weight" or "Not inspected." That is notice to the inspector or weigh-master at destination to reweigh the freight or inspect the contents. Wherever that system is in existence we have very little trouble in wrong classification, and most of the complaints that reach me in that case are brought about by the simple difference of opinion as to what the classification should be and the misinterpretation by the inspectors themselves.

Q. That is, a difference in judgment between the inspectors themselves as to second or third or fourth class rates?—A. Yes. We had a very peculiar one this year, where a feather costing a cent doubled the rate on millinery.

Q. (By Professor JOHNSON.) You have explained several times about the difference between rates for carload lots and for less than carloads. Are you in favor of having essentially the same rate on less than carload lots as on carload lots?—A. Not necessarily the same rate. The difference between carloads and less than carloads should not be so great on any merchandise commodities as to prevent a movement in both cases.

Q. Do existing practices discriminate very strongly against the small shipper?—A. The existing practices to a very large territory to-day do; to all the territory west of the Rocky Mountains and to all of Texas. We have no trouble of that kind in the Southeast, particularly between the Mississippi River and the East. In the first place, the difference between carloads and less east of the Mississippi River is frequently not over 3 cents a hundred, while on the Pacific coast it is 50, and in Texas it ranges from a minimum of 20 cents to a maximum of 45.

Q. (By Professor JOHNSON.) That operates against the buyers of the territory as between your city and San Francisco?—A. It places the retail buyer on a great many commodities entirely in the hands of the jobber that is near by him. The profit on nails, for instance, is less than 40 cents a hundred. That is the jobber's profit. The jobber's profit on almost everything, any heavy commodity, is less than that; and when the difference is so great that it confines the retail dealer to the jobber in his immediate locality, vicinity, he pays more for his goods than if he could have the competition of jobbers in other farther away cities as well as the ones close by.

Q. (By Senator MALLORY.) You have some experience, I suppose, with railroads in the hands of receivers?—A. Yes.

Q. Do you find any difference between dealing with them and railroads that are not in the hands of receivers?—A. Well, the railroad that is in the hands of a receiver has no interest to pay, and consequently it can and does carry freight frequently for lower rates than it would if it had its interest to pay. Another proposition that comes in there is that of a line that needs money. You see an interest debt is due at a certain time and the money must be had, and a rate can frequently be secured over such a line at that time on a large volume of tonnage to get the ready money, on the same principle that a merchant will sell his goods at cost to get the money to pay a note. That is another case where a man with a large volume of tonnage has the best of the man with a small volume.

Q. The roads in the hands of receivers, as a general thing, having no interest to pay, can do this. Do they cut rates?—A. Yes; the record of rate cutting will show that the greatest aggressors and some of the worst forms of abuse of the interstate commerce act have been by lines in the hands of receivers.

Q. Discrimination—do they practice that also?—A. On the principle that any rebate is a discrimination against the man that does not have one, yes.

Q. (By Mr. KENNEDY.) United States officers violating the laws of the United States?—A. Yes.

Q. (By Professor JOHNSON.) Would you have the laws in regard to receiverships amended in any way?—A. I think the law is sufficient to cover it as it is if complaint was made. So far the only case we have had where complaint was made is the one I mentioned this morning, in the Missouri River case, where the receivers applied, and, instead of getting a judgment, were required to restore their rates. That was not a rebate, but a rate published according to law, but a worse discrimination than if it had been a rebate.

Q. The system of receiverships is very bad frequently; that is, the appointment of

the former managers of the road as receivers?—A. The receiver usually is appointed by the influence of the majority bondholders; the majority bondholders usually control the stock, and for that reason they usually make the president the receiver—the president and receiver being the same man; that is more frequently the case.

Q. Is it not against public policy to have the management that brought the road into the condition of insolvency to continue in the management of the road while in insolvency?—A. I do not know that it is; that is, from the standpoint of the owner of the property. It may be against public policy from the standpoint of the public. I do not think there is any grievous wrong in that situation. It seems to me the man who owns the bonds has the right to say who shall be in control, and if his choice happens to be the officers of the company, and if they have served him satisfactorily as president and traffic manager, they should serve him satisfactorily as receiver.

Q. (By Senator KYLE.) More a matter for their lookout than the public?—A. Yes; as a general proposition receiverships of railroads are not brought about by the fault of the manager of the property.

Q. (By Mr. PARQUHAR.) Are they brought about for the purpose of reorganization?—A. Frequently, because the capitalization is greater than they can pay the interest on.

Q. That gives the opportunity of reorganization?—A. Yes; and sometimes the only method that can be pursued.

Q. That is done to force out the small lien holder?—A. It forces out the stockholder and sometimes the second mortgagee. Usually, however, the stock is wiped out and both mortgagees take the property.

Q. (By Senator MALLORY.) What would you say was the crying abuse arising out of the railway system now prevailing in this country?—A. The inability to get legal relief of any nature.

Q. You think that is the great crying evil?—A. Men in my position do not apply to the Interstate Commerce Commission for the reason that after we have a decision we have still to go to the courts, where the whole case can be reopened and entirely new evidence presented, and the evidence you take before the commission has practically no value except what it may have developed that you did not know yourselves.

Q. Your answer relates to that kind of relief. I do not infer you mean the inability to get judgment against the railroad company for cutting off your leg or anything of that kind?—A. I referred to the traffic.

Q. Even when you have a decision of the Interstate Commerce Commission, you have taken a very small step toward correcting the abuse?—A. It is entirely with the railroad company, after you have your decision, to say whether they will obey it or not.

Q. Have you anything to suggest for the correction of that evil?—A. I have some rather pronounced views on the changes of the law.

Q. We would like to have them.—A. As it now stands, if we can not get relief from the railroad companies themselves, we accept the best we can get and try it again later on. When we apply to the commission, it is because we think we will develop something that will enable us to go before the railroad companies again, not with the expectation that the commission's order will be obeyed.

I have some memoranda here with regard to my views on the amendments to the act to regulate commerce.

(Reading.) "The Interstate Commerce Commission, under the law as it now exists and is interpreted by the courts, is powerless to remedy existing evils. Its lack of power is so well known, and its orders so seldom obeyed, that the shipping public have almost ceased to appeal to it for relief. First, because its orders are not obeyed, except when railroads interested decide it to their interest to do so; second, because delay in rendering a decision after cases are heard is generally so great that shippers either abandon their fight or compromise with the railroads before decision is secured.

"The act to regulate commerce should be amended by Congress at the earliest moment possible—

"First. By making the findings of the commission enforceable at law, unless upon appeal to the courts they are found to be unlawful or unjust, and pending the decision of the courts on such appeal the findings of the commission should be made effective by all the railroads interested within 30 days after they are promulgated by the commission, and continue in effect until overruled by the courts or changed by authority of the commission.

"That while the commission shall not have the authority to fix the rates or say what rates shall be charged, they shall have authority to order reduction in rates

where found to be exorbitant and to determine the relation of rates as between localities and commodities."

What I mean to explain there is the proposition we now have on grain and flour. They have ruled that the difference on flour and wheat should not exceed 2 cents, the idea being that the railroads ought to be compelled to put that order in effect unless the courts should decide after a hearing that it was too small a difference. I do not ask that they should have authority to say the rate should be 10, or any given amount, but that the difference should be that.

Q. (By Professor Johnson.) The same would apply as between communities?—A. The same would apply as between communities. If the difference between St. Louis and Cincinnati and the south on a given commodity was 4 cents if St. Louis or Cincinnati was to apply to the commission for reduction or increase, whatever their order should be on that proposition, should go into effect until countermanded by the courts. (Continuing to read:)

"Second. By enforcing absolute publicity of all rates, rules, or regulations affecting transportation of persons or property, whether such rates, rules, etc., are between points in the United States, or export and import traffic. If lower rates are made from or to the seaboard for export, or on import, than on domestic traffic, such rates, rules, and conditions to be published in the same manner and under the same conditions as domestic traffic. The railroads interpret the proposition now that they do not have to publish their export rates. If you put the export grain rates out of the knowledge of the public, you might as well have all of them out of the knowledge of the public, because you have the ruling factor in the price of grain, so you do not know what it is. The same proposition would apply on imports. Where through rates and divisions are made on foreign traffic, said rates and divisions to be published in such manner as required by the Interstate Commerce Commission.

"By requiring railroads and other common carriers subject to the act to regulate commerce, not only to file copies of tariffs, rules, and regulations with the Interstate Commerce Commission, but also to furnish, on request, from boards of trade, exchanges, shippers, freight bureaus, and other commercial organizations, whose duties are to look after transportation problems for their respective cities and communities, copies of all tariffs that affect members of such organizations, directly or indirectly, whether such tariffs read to or from such cities, etc., or to rival cities, and in case of refusal of railroad companies to furnish such tariffs, the Interstate Commerce Commission shall have authority to order them furnished within a reasonable time, not longer than 30 days; and in the event any current tariff is found to be out of print, though still in use, the railroad company shall be required to furnish certified copies of same, including all amendments or corrections."

I make that point for the reason that frequently in making up a comparative situation as between one city and another you apply to a railroad company for the tariff from a given territory to a rival city. It is not refused, but they say it is out of print. The consequence is that a man who is not posted as to how to get that tariff does not get it. If I get an answer of that kind, and I only get it from one road, I write the auditor of the Interstate Commerce Commission for a copy of the tariff, and I get it. A great many applications of that kind are not furnished, however, for the reason that knowledge of how to get it is lacking. I only suggest that this be done where asked for. I do not think it is necessary to have these tariffs filed continuously with the merchants' exchanges or organizations of that kind, but they should be required to furnish them when asked for. That is one part of the publicity of the tariff, and I think if the Interstate Commerce Commission had nothing to do but secure absolute publicity of rates it would be worth all it has cost. A railroad company can not continuously discriminate in public tariffs without in the end getting into trouble. [Continuing to read:]

"Third. By making all traffic moving by rail or partially by rail and partially by water, whether domestic, export, or import traffic, amenable to the act to regulate commerce; on export and import traffic, the rates or proportion of rates accruing to the inland carrier to be amenable to the act to regulate commerce, and subject to the control of the Interstate Commerce Commission, and under same rules as apply to domestic traffic.

"Fourth. By prohibiting railroads from making or accepting lower rates or lower proportion of rates on grain to the seaboard for export than they at the same time accept on flour or grain products to the seaboard for export, provided grain products may be required to be loaded to the marked capacity of the car."

That is to counteract the decision in what is known as the Texas-Pacific case, under which the railroads claim that no export or import is amenable to the interstate commerce law, and they do not have to account to the commission for their rates,

It seems to me one of the worst forms of discrimination against American manufactures that I know of. [Continuing to read:]

"Fifth. By repeal of the imprisonment penalty against the shipper or receiver who procures or accepts lower than lawful published tariff rates, whether such preferences be made by rebates, commissions, or otherwise, except that where a shipper, by fraudulent practices, procures lower than authorized published tariffs, the imprisonment clause shall be continued in effect against this class of shipper."

The object of that is to get testimony. You can not get testimony with reference to a violation of the act under the present law, because every receiver is just as much a criminal under the act as the man who made the rate. [Continuing to read.]

"By repeal of the imprisonment clause against officers and agents of railroads, and substituting therefor money penalties upon any corporation, officer, agent, or any other person through whose instrumentality other than the lawfully published rates, rules, or regulations affecting the transportation of persons or property shall become operative or available; it being understood that such penalties against the railroad companies should be sufficiently great, not less than \$5,000, or double the revenue received by the company at unlawful rates where greater than \$5,000, and the railroad company itself shall be the party against whom the fine shall be assessed."

Q. How about a railroad in the hands of a receiver?—A. Make that a debt of the company, the same as any other debt of a company.

Q. You can not enforce it without the consent of the court which appoints the receiver.—A. I was not looking for all of the law points. I see your point clearly. So long as the law exists as it is now you will never get a railroad man to furnish any testimony against another railroad if the imprisonment clause remains in. If it is taken out as against the shipper, you might get some testimony from the shipper, but you will never get a complaint from the source where the proof can be gotten. If the law was so amended that it was to the interest of the railroad to complain against its rival, and imposed no penalty except a fine against the corporation, there would be no trouble about getting evidence, and the railroads themselves would furnish it; but a railroad man will come as close to perjury as possible to not convict his fellow-employee or the employee of another line, for the reason that the imprisonment penalty clause exists. [Continuing to read:]

"Sixth. By restoring to railroads the authority they were supposed to have before the decision of the Supreme Court of the United States was rendered in the Trans-Missouri case, viz, by permitting them to agree upon reasonable rates and to maintain voluntary associations for the maintenance and promulgation of such rates, compilation of statistics, and transacting such other joint work of railroads, members of the association, as may not be in conflict with the fifth or antipooling section of the act to regulate commerce, it being understood that no change in the law that will legalize pooling of traffic or of earnings is indorsed by me. On the contrary, I am firmly of the opinion that such amendment is against the interests of the public and not needed by the railroads themselves.

"All agreements between railroads and other common carriers to be filed with the Interstate Commerce Commission not less than 10 days before going into effect; and if, on investigation, any clause in such agreement is contrary to any clause of the act to regulate commerce, said agreement shall be decided by the commission not in effect, and shall be corrected by the railroads to correspond with the opinion of the commission before becoming effective.

"Seventh. Proposed change in act to regulate commerce, requiring longer notice than 3 days for reduction in published tariffs and 10 days for an advance, would be injurious to the public, and of no benefit to the railroads. A reduction is sometimes absolutely essential to enable some classes of traffic to move at all, and if even 10 days' time is required to make the rate effective, the opportunity to move the traffic at all will have passed. The law of Kansas requires 60 days for an advance in rates; it frequently prevents reductions of great value to the people being made, because once reduced they must stay in effect for 60 days.

"Eighth. By adding a clause prohibiting ticket scalping, with provisions similar to the Sherman bill before the last Congress.

"Ninth. By requiring the Interstate Commerce Commission to render its decisions not later than 90 days after close of testimony in case, unless longer time is given by mutual consent of complainants and defendants.

"Tenth. If it were possible to require the various States to repeal all laws in conflict with the act to regulate commerce, and to adopt it as the law, between points within their respective States, we would then have an improved condition of value to all interests. The conflict upon the borders of adjoining States is frequently such as to create unjust discrimination between commodities."

If it were possible to withdraw from the States the authority governing rates, rules, and regulations of transportation between points within the respective States and make same, whether State or interstate, amenable to national laws, it would simplify and in the end would benefit all concerned.

Q. You said you did not think the legalization of any agreements, freight pooling agreements, between the railroads of the country is desirable or would be beneficial in any way; why do you think so?—A. It would not remove the incentive to reduce rates, but, on the contrary, it would increase the incentive to reduce rates under certain circumstances.

Q. I asked that because we have some very high authority for that view.—A. Theoretically the pooling proposition is a beautiful one, but not in actual practice. To put my answer in the form of a question, How are you going to get an agreement as to the proportion accruing to each line? After you have gotten that agreement the line that gets more to-day than it can haul is going to do something to keep its proportion from being below what it was allotted. If it is continually being paid earnings of money that it did not earn by hauling the traffic and continually having transferred to it tonnage that it did not get by solicitation, it is evident that it has been allotted too much or too great a proportion. To prevent that the line is going to pursue the same methods as it does now, even at the expense of having to pay over sometimes more than its proportion. Now, on the other side, these pooling agreements will be for given periods. The line that thinks its allotment too small can afford on a great volume of business to allow a rate continuously, even if it has to pay into the pool part of its earnings or has to divert its business and pay for it, in order that when the next allotment comes around it shall get a greater proportion. There is no law that I can see that will make me say how little of a given proportion of business I will accept. That has been the means of breaking every pool that has existed so far.

Q. Now, under the conditions that would exist if pooling was legalized railroads could go into these agreements, and these agreements if violated could be enforced in the courts. It can not be done now, but if it were legalized it could be done, and this disposition on the part of the railroads to violate the agreement, it seems to me, could be checked just exactly as the disposition on the part of individuals to violate their contracts is checked by penalties arising from the operation of the law.—A. Individuals violate their contracts and prices continuously.

Q. A man makes a contract to-day as to a certain thing and he fails to live up to it; the man who was to receive the benefit can recover as damages the amount of damage he sustained.—A. Admitting, which I do not admit, that the railroads would profit by a pool, by a legally authorized pool, where does the public come in? A pretty good evidence that that is not needed is that, even weak as the law is to-day, I will venture to say that at least 85 per cent of the rate cutting that was in existence in 1898 has been wiped out in 1899. Now, if we had a law that was enforceable, as to its violation, I do not believe any pooling clause necessary. I think it is unfortunate that the Supreme Court found that the trans-Missouri agreement was in violation of the trust law. It was not in violation of the pooling law. Now, I would like to see, for the benefit of the general public, the railroads have the authority to avoid discrimination in violating, cutting the rate. They can make the penalty as great as they please, but whenever you take away from the shipper the right to put his freight over any line he pleases you are taking something away from him. He may have very good reasons why he wants it to go over a certain line. That line may have its quota of tonnage and may not be able to take it. You take a shipper of poultry who has icing facilities along a certain line; his arrangements are such that he wants his freight to go over that line, and it goes to the railroad company and the railroad company finds it is ahead in its tonnage and gives it to its rival. The poultry may go through without being iced at all, or he may have to pay a higher price where it was iced than he would at his own ice house. There are various reasons he might have, and the reconignment proposition—through one gateway and not through another. I think it would be very unfair indeed to take away from the shipper, where the tariff is the same by two different routes, the privilege of selecting by which line it shall go over.

Personally, as to what the railroad company does with its earnings, I do not think it is the shipper's business, but I do not think the law should be so as to give the railroads absolute power to divide the business or tonnage; it takes away the only power the shipper has.

Q. (By Senator KYLE.) Is not the universal argument of the railroad companies that they are held by the throat by the large shippers in the States?—A. The large shipper would hold them by the throat still. You take cotton ties in Texas as an

illustration; a man finds he can give the railroads at a certain time a large tonnage when business is slight. He goes to the railroad companies as an organization, "if you make our rate so and so, we will give you that within certain months." That was done this past year on cotton ties and the rate was not known to the public until the sales had been pretty generally made. Now, there was not anybody but this large shipper in a position to go to the railroad and make this proposition and get this price. The small competitor would not be in it.

Q. There was no small competitor in that case, was there?—A. There were a lot of shippers that had a lot of cotton ties on hand, and it decreased the value of their stocks to the extent of the difference in rate.

Q. (By Senator MALLORY.) That is your conclusion, then, regarding pooling, that it will not work well because it deprives the shipper of the freedom of action which he now enjoys of shipping by what route he pleases?—A. That is one conclusion, and the other is that it is not a remedy for the evil, and the third is that it is not needed by the railroads themselves.

Q. (By Senator KYLE.) You do not think it would help out the small shipper?—A. It would not help the small shipper at all.

Q. That is the contention of the companies.—A. It seems to me at a small station the people will not be affected; the local business will not be pooled, because that belongs to that railroad anyway.

Q. (By Professor JOHNSON.) Is the prohibition of the right to assign freight over a common line a necessary feature of pooling?—A. It is one of the easiest methods.

Q. I know; but is it the necessary way?—A. You can pool your earnings or your traffic.

Q. I want to get your view on another question, which is germane, I think, to that. It is the evident tendency of the railroad corporations in this country to consolidate, is it not, in your judgment?—A. Yes.

Q. Will not that of itself serve as a corrective of this evil of discrimination?—A. Yes.

Q. The effect being that when you have 1 railroad where there are now 5—1 railroad corporation controlling 5 railroads, whereas to-day there are 5 distinct corporations competing with each other—the tendency will be to do away with the necessity for discrimination?—A. We have an illustration of that in the St. Louis, Peoria and Northern, built out of St. Louis and intended to go to Chicago, and 1 line to Clinton, Iowa, this year. As soon as it got to Peoria it became one of the greatest rate cutters between St. Louis and Chicago that we had. It belonged to no association and took what it could get. It had its right of way bought and the rails on the ground to build to Clinton, Iowa. The Chicago and Alton and the Illinois Central and the Missouri, Kansas and Texas formed a pool and bought the Chicago, Peoria and Northern Railroad. They sold the rails that were to be built to Clinton, Iowa, and the road becomes a part of the Alton and the Illinois Central; and that competitor is out of existence. I think that will be the end to the Pittsburg and Gulf; that it will be bought by a combination of roads that will control its rate making. Even then, as between combination and legalized pooling, I think the combination is the preferable one of the two, so far as the public is concerned.

Q. That is, looking at it particularly from the point of view— A. (Interrupting.) Point of view of the city of St. Louis, which I represent, or the point of view of the shipper as a whole. There are a great many railroad men that do not consider pooling necessary.

Q. Their number has increased of recent years?—A. Yes.

Q. (By Senator KYLE.) The president of the Great Northern is opposed to it, I believe.—A. I think Milton H. Smith, of the Louisville and Nashville, is also opposed to it. If that pooling clause was repealed without any other change, I do not know that the public would be affected. They would still have the trust act back of it. I oppose the legalizing of pooling—not the pool itself.

Q. Would it not be legal if not prohibited by law?—A. What the railroads ask is to make their contracts between each other absolute; collectible by law.

Q. That would be done simply by repealing that?—A. They were not collectible by law prior to the interstate-commerce act; there are thousands of dollars to-day owing by railroad companies under the old pooling clause that were never paid.

Q. (By Professor JOHNSON.) They were illegal at common law?—A. As I understand it.

Q. (By Senator MALLORY.) On the ground of public policy?—A. Yes.

WASHINGTON, D. C., October 8, 1899.

TESTIMONY OF MR. SAMUEL R. CALLAWAY,

President New York Central and Hudson River Railroad Company.

The commission met at 2.40 p. m., Vice-Chairman Phillips presiding. Mr. Samuel R. Callaway, being duly sworn, testified as follows concerning the topics in the plan of inquiry on transportation:

Q. (By Senator MALLORY.) What is your name?—A. Samuel R. Callaway.

Q. Where do you reside?—A. New York City.

Q. What is your occupation?—A. President of the New York Central and Hudson River Railroad.

Q. How long have you been connected with the railroad business?—A. Since 1863.

Q. How long have you been connected with the New York Central system?—A. I have been president of the New York Central and Hudson River Railroad since a year ago last April. Prior to that I was president of the Lake Shore and Michigan Southern; president of the New York, Chicago and St. Louis; president of the Toledo, St. Louis and Kansas City. Do you want my history right back?

Q. No; just to show your acquaintance with railroad matters. You have been connected with railroads since 1861?—A. Since 1863. I have been connected with railroads from the Atlantic to the Pacific during that time.

Q. You have seen the syllabus of this subcommission on transportation of the commission?—A. Yes.

Q. And I believe you have prepared answers with reference to the inquiries propounded in that syllabus?—A. Yes.

Q. Now, in order to expedite matters as much as possible, will you just take that up as you have prepared them?—A. Shall I read them?

Q. Yes, if you please.—A. The first question seems to be divided into sections. In answer to section 1—"Terms and conditions of employment"—from any person entering the employ of the company we receive the assurance of his willingness to obey any reasonable rules that may be made.

Q. This is under the head of employees?—A. Yes; after being employed it depends upon the employee himself as to his remaining. So long as he faithfully discharges his duty, there is no reason why an employee should not remain in the service and be in line for promotion when the opportunity offers, which promotion is dependent upon such performance and further capacity for increased responsibility. There are no physical conditions required, except in case of employees who are required to take signals, such as enginemen, firemen, conductors, and trainmen, such employees having to pass an examination as to their eyesight and hearing.

Rates of wages of different classes of employees: Most of our men are paid for the number of hours' work and for the number of miles made, the average pay of employees being as follows: Telegraph operators, \$52.50; block-signal men, \$46.50; other signalmen, \$49, which includes baggagemen, station clerks, etc.; enginemen, \$114, although their wages vary from \$90 to \$175; firemen and wipers, \$59, firemen getting from \$50 to \$84; conductors, \$86, their baggagemen and trainmen's wages varying from \$40 to \$70; mechanics and helpers in shops, \$49; other shopmen, \$40; roadmasters and track foremen, \$49.50, roadmasters being paid on an average from \$100 to \$125 per month, and track foremen from \$40 to \$50; track laborers, \$35.50; switchmen, flagmen, watchmen, etc., \$40; mechanics and helpers on road, \$56; employees of floating equipment, \$58.

Q. Do I understand you to say that all men on your road are paid by the hour?—A. By the trip—the trainmen largely.

Q. The trainmen are paid by the hour?—A. The men in the shops are paid by the hour. That is true of nearly all the men in the service, in the shops or on the trains.

Q. The men in the shops are paid by the hour and the trainmen by the number of miles they run?—A. Yes; and we have an average. Their wages are for a certain time and we have an average.

Wages, basis and stability thereof: This is arrived at by the amount of work, character and ability of the employee. Our rates themselves have not changed; the men being paid for the work done, being greater in some months than others. This, of course, does not apply to monthly men.

Reductions and deductions, and their causes: We have no reductions and no deductions, except for value received, such as rent, board, uniforms, etc. For instance, if a man puts an order in that his rent is to be deducted from his wages and gives it to the person from whom he rents or boards, we take that out; otherwise there are no deductions, excepting by arrangements with the employees themselves.

Q. Have you any specific number of hours per day for men to be employed in the train service?—A. We generally limit their time to 8 or 10 hours on a train; but of course that is subject to accidents or derailments, when they are paid for overtime, and they are not allowed to go out after they come in until they get a certain amount of rest. I think the limit is 8 hours.

Q. Then the trainmen, when they work over the ordinary time of necessity are paid regular rates?—A. They have a general scale of wages. I do not know what they are. I can furnish them to you if you desire to have them. We have a regular agreement in regard to these things.

Discharge and suspension and the reasons therefor: Discharge or suspension is determined by the man's individual record and the seriousness of the offense, each case being determined by itself. There are various reasons—neglect of duty, insubordination, incivility, dishonesty, and similar conditions met with in all other business.

Usual hours of labor exacted of different classes of employees: Station employees have necessarily long hours, but there are stretches, sometimes for hours at a time, where at some stations they have little or nothing to do. For instance, at some of the country stations a train may come along in the morning, a train may come along at noon, or it may come along at night, and it makes a very long time; there is very little to do in the interim.

Telegraph operators are not required to work more than 12 hours; same with signalmen, and, in some towers where a large number of levers are employed, 8 hours constitute a day's work.

In the passenger-train service our men do not average as high as 10 hours steady work during the 24. In freight service it might be in some cases 12 hours, but they receive sufficient rest before again taking their run.

In answer to question 3—"Sunday labor and overtime; conditions under which required and compensation therefor; limitation thereon by State laws, and effect thereof on employees, carriers, and the public:" On account of the accumulation of freight at the various terminals, it is necessary for our freight crews to work on Sunday in order to clean up and be ready for the next week's business, and, as train employees are paid by the mile, they receive same compensation as they would for similar service on week days. On some of our local passenger runs, where the runs are unusually hard and where they are required to work more than half of the Sundays in a month, conductors and trainmen are paid double for such Sunday work over and above two Sundays. Just as little as possible Sunday work is done, and only those are kept at work that are actually necessary for proper and safe running.

Q. Would it be possible, do you think, to give up the Sunday freight business entirely?—A. I think not.

Q. Georgia, you know, has adopted that rule. The Georgia railroad commission prescribe a rule, if I am not mistaken, that prohibits the running of trains through the State of Georgia?—A. Yes; and they have the same law in Connecticut, too.

Q. In your judgment, could that be practically done, or could it be generally done without great detriment to the public interests?—A. No. We carry such a large amount of perishable freight that the stoppage of that freight would be almost an impossibility. I will say, personally, that I am very much opposed to Sunday work, and we limit it as much as possible. Dead freight we allow to lay generally from morning to night, but perishable freight must be run through, as have also passenger trains and the transportation of mails.

Aid and benefit features of employees' associations; conditions and extent of relief: Among the employees we find benefit associations, and accident insurance is maintained by the following brotherhoods: Brotherhood of Locomotive Engineers, Brotherhood of Locomotive Firemen, Brotherhood of Railway Conductors, etc. They all have assessment insurance.

Question 9. "Relief and aid to sick and disabled employees, by railroads and other carriers by land; conditions and extent thereof; its effect on relations of employer and employees." This company makes it a practice, where their employees are injured, to allow the injured person half time.

Q. Half pay during the time of his indisposition?—A. Yes; we have no pension fund, or anything of that kind on the road, but we have a very large pension roll, men that have been a long time in the service, and are incapacitated, and we put them on what we call the pension roll, subject to the board of directors and president, sometimes for half pay, sometimes for less, and sometimes for whole pay.

Q. Have you such institutions as railroad hospitals, that are maintained by contributions from the employees?—A. No. We run through a thickly settled country, and we have arrangements with hospitals at nearly every point where men are likely to be injured to take care of them.

Q. If I understand it, if a man is injured, without reference to whether through his

own negligence or not, he is paid half pay?—A. Yes; he is paid half pay while he is in the hospital, or while he is laid up. Then, if they are incapacitated by reason of the loss of a leg or arm, we generally provide them with some place at a gate or signal tower or place of that kind, and give them light work.

Q. (By Professor JOHNSON.) Do you have any provision with regard to retiring men at a certain age?—A. No; we have nothing of that kind on the New York Central.

Q. Well, supposing a man reaches 60 years of age in your service and becomes incapable of future service, what have you planned to do with him?—A. Well, a man does not generally become incapacitated at 60. We have lots of men in the service 70 and 75.

Q. It is not your plan to turn men off at a certain age?—A. No. Of course these things are all regulated by officers, and they generally endeavor to be considerate and kind to the men and try and find them some light employment. We have a very large number of old men on the New York Central. It is an old road and the proportion of old men is very large.

Q. (By Senator MALLORY.) Are you acquainted at all with the rules and regulations governing these brotherhoods of locomotive engineers, and firemen and train hands, as to the benefits derived by the men pending their sickness or pending their disability? I understand, of course, that the railroad company pays half wages if the man is injured on the road and goes into a hospital. Now can you say whether they receive any assistance from their brotherhoods?—A. Well, I do not know as to that. I think a large number of our men insure themselves. We have 2 or 3 insurance companies working on the road, and they give these insurance companies orders on their pay for so much per month. The paymaster honors these orders, and I think the large bulk of men are insured in these accident-companies. I presume they are insured in their brotherhoods, but I know nothing about their rules.

In answer to question 10: "Automatic couplers, air-brakes, and hand holds, on passenger and freight cars; percentage of freight cars so equipped; cost of such safety appliances on old and new cars; cause of delay by railroads in complying with requirement of act of Congress relating to safety appliances on freight cars." Our passenger and freight cars are all equipped with M. C. B. couplers and hand holds and about 68 per cent of the freight equipment is equipped with air brakes. There was no delay on the part of this company in complying with the requirements of the act of Congress. That is, we were finished by the time of the first date. The first date, I think, was last December or last January.

Q. And you adhere to the type of the Master Car Builders' couplers. Is that the type that is prescribed by the Interstate Commerce Commission?—A. The Interstate Commerce Commission have prescribed the height, and there are certain rules; I do not know what they are; but we have, of course, complied with those. And they also prescribed in regard to the hand holds on a car. Whatever the law is, we have complied with it.

Q. Complied with it to the extent of 68 per cent of the freight cars?—A. All of our freight cars. Sixty-eight per cent are equipped with air brakes. We are not required to have them on all.

Q. Have you complied with the coupler requirements in full?—A. Yes.

Q. And you are able to say that all your freight cars have that coupler attachment now?—A. Yes.

Q. Have you investigated or inquired into the likelihood of there being a better system of appliances than those that are now in vogue; for instance, a better system of couplers? I remember when that was suggested in Congress, one of the great objections by certain representatives of the railroads was that the matter of couplers was in embryo; that they had not reached such a definite point that they could say that the best coupler had yet been developed; and that they might have to go to the expense of putting on a different style of Master Car Builders' couplers, which included 4 or 5 different styles, and in 3 or 4 years have to put on a coupler which was supposed to be better. Now, the question is whether they have reached a point where the coupler is satisfactory, so far as you know?—A. We had a great deal of difficulty with the couplers at first, but of late years I have heard of no trouble. They were not sufficiently strong in their parts, but that is remedied to-day, and I think the coupler we have to-day is satisfactory.

In answer to question 11: "Effect of increased use of automatic couplers, air-brakes, and hand holds on freight cars on number of casualties to railway employees." There is no doubt that, after all freight cars are properly equipped, the number of casualties to railway employees will be materially reduced. In the transitory state at the present time, where some cars are equipped and some not, there does not appear to be any marked decrease in the number. It is really an element of danger

now, because to couple the cars with a patent coupler to one with the old couplers is a dangerous operation.

Q. A man has to go in between the cars now to couple the patent coupler with the old link and pin coupler, just as he would with the old link and pin couplers?—A. Just the same.

Q. But that will be done away with when they are all equipped?—A. That will be done away with when they are all equipped; yes.

In answer to 12: "Other methods and devices for insuring safety of employees and passengers on railroads." This road is entirely equipped with block signals between New York and Buffalo, the object of which is to keep trains a safe distance apart, the result of which makes it impossible for two trains to come together without the cooperation of two or more employees failing to properly perform their duty at the same time. These block signals require block towers at various intervals on the road, and are to all intents and purposes watchmen, as, if anything is discovered out of the way on trains such as hot box or train parted, the information is immediately communicated to the next tower, the train being notified. This has proved itself to be of considerable value in times past. Not very many years ago coal stoves were used in coaches. Steam heat is now used, lessening the danger by fire in case of accident. I have my doubts about the value of steam. I think in cases of escaping steam there is about as much risk as by setting fire to the coach, but under the New York law we were obliged to do it and we did it.

Q. How about lights in the cars?—A. Our trains are lighted very largely by Pintsch gas and electricity. We are experimenting with electricity. Up to this time it has not been very satisfactory. I think most of our cars are equipped with Pintsch light.

Q. To what extent, if I may ask, are your roads double tracked or more than single tracked?—A. We have between Buffalo and Albany 4 tracks on the main line and 2 tracks on the West Shore; 1 track on the Niagara Falls line; and 1 track on the Auburn line; which gives us largely the use of 7 tracks between Albany and the contiguous points on the West Shore, through Medina to Buffalo. From Albany to New York we have 2 tracks on the West Shore, and 2 tracks on the New York Central as far as Sing Sing, and 3 tracks from Sing Sing to New York, and are practically operating 5, 6, or 7 tracks continuously.

Q. (By Professor JOHNSON.) How many tracks are there on the Rome, Watertown and Ogdensburg?—A. It is almost entirely a single-track road.

Q. Is that true of the system of the northern part of the State of New York?—A. What we call the village line, Niagara Falls line, has a double track. I have forgotten just how far it extends; but the rest of them are all single-track roads.

In answer to question 13—"Their nature, purposes, and effect; proportion of employees belonging to them; extent of their control of their members; their effect on employees who are not members of such organizations," Railroad branches of the Y. M. C. A. are located at nearly all of our large terminals and yards. They are presided over by a secretary, and a very large number of our employees in the train service make use of their accommodations, lunch rooms, etc., paying nominal dues, \$3, or more if their purse may warrant. Sleeping rooms are provided for members, and they can be secured for the sum of 10 cents per night. They likewise have bath rooms, shower, plunge, etc., and each branch has a lunch room which is very largely patronized. We find, with these associations, the men in their spare time, when away from home, may be found there most of the time, keeping them out of places where they should not be. We have a large number of employees, however, who do not avail themselves of these privileges. The greater portion of them being home every night, they do not feel the need of the association as those who are away.

Our line, I may say, is largely equipped with men who have been in the service for a long time, and a great many of them own their homes, and of course they have no necessity for those places, and wherever there is a necessity, the railroad companies have generally built a building, and in many cases Mr. Vanderbilt has equipped it himself with a library and all other furnishings, and the men take hold of it, and we pay the secretaries generally.

Q. These advantages are open to all employees of the road who pay the dues?—A. Yes; these dues are for the maintenance of the reading or writing room and the maintenance of the lunch room, and the many things in connection with these rooms.

Q. (By Senator KYLE.) You serve meals there, do you?—A. Yes; we serve lunches. We have 4 rooms altogether in the vicinity of New York. We have quite a large room, and a hall and dining room opposite the depot in Albany, and most of our men go there to get lunches and meals.

Q. What did I understand you to say the charges for meals were to employees?—A. They run from 10 cents up. A man can go in there and get a nice lunch for 10 cents and he can get a good dinner for 25 cents.

Q. From freight trains operating back and forth the employees can go in there and get meals or lunches?—A. Yes; we have 2 in Albany, one opposite the passenger depot and one opposite the shops.

Q. They take the place of what are called eating houses?—A. The eating houses, I think, are for passengers. I think as a general thing these are exclusively for our own men. Eating houses are places where trains stop for passengers to get their meals.

In answer to question 14, which is in reference to strikes—We have had none in years. The last one was occasioned by the employees insisting upon naming their immediate superiors. I was not connected with the road at that time and I do not know anything about the merits of it. My understanding is that the switchmen insisted upon having the yardmaster one of their own men and one agreeable to them, and the company objected to this, and they had a strike, which was more or less serious.

Q. (By Senator MALLORY.) Do you know what the result of the strike was?—A. I do not.

Q. Whether the men accomplished their purpose or not?—A. I should take it that they did not, because we do not allow men to name their superiors now.

Q. Do you remember what year that was?—A. No. My recollection is that it was quite a serious strike. I recollect that they had a good deal of difficulty. I can get you the details if you care for them. This is a memoranda that the superintendent gave me. I asked him if they ever had any strikes, and he said this was the only one that they ever had—in connection with switchmen.

"State and Federal laws designed to repress strikes; judicial construction thereof and decisions thereon."—We do not know that the transportation of United States mail has any effect on strikes.

In regard to the use of intoxicants by employees, it is prohibited. We have men who look the employees over before we allow them to take trains out, and see that they are in proper condition. Men that are in the habit of using intoxicating liquors and let them get the worst of them are required to leave the service.

Q. (By Senator MALLORY.) Have you any rule prohibiting engineers or firemen from drinking at all—requiring them to be total abstainers?—A. I think not. Here is a copy of the rules, our book of rules; section 9 of the operating department states "that the use of intoxicating drink on the road or about the premises of the corporation is strictly prohibited. No one will be employed, or continued in employment, who is known to be in the habit of drinking intoxicating liquors." I do not think we have ever gone to the length of saying that a man can not take a drink if he wants to, but we endeavor to see when he goes on the train that he has not been drinking.

Q. (By Senator KYLE.) Certain roads make it absolutely prohibitory, do they not?—A. They try to. My judgment is that it is almost always more or less of a dead letter.

Q. (By Professor JOHNSON.) Have you any objection to the men joining the brotherhood?—A. Not at all.

Q. Do you make any inquiry, then, in regard to that matter?—A. No. So far as I am personally concerned I have never had any trouble with the brotherhoods. I have had a good many strikes, a great many troubles, particularly in the West. I was connected with the Union Pacific at the time of the Irons strike, and it was intended that the men on the Union Pacific should go out. That was the intention of the Knights of Labor. At this time they had 25,000 of our men in the Knights of Labor and they had elected all the judiciary in that part of the country in their control, and I had more or less trouble with them. It finally eventuated in a serious riot at Rock Springs. There were some men burned alive and the Government took hold of it, and it finally straightened itself out. And we had one out on the Missouri Pacific, with the result you all know about, when we had a very serious strike. But as a general thing I have gotten along very comfortably with the labor unions, and have not any particular objections to them so long as the men do the work for which they are paid.

Q. (By Senator KYLE.) Have you examined the bill passed by Congress the last year relating to arbitration between the men and their employers?—A. Yes.

Q. What do you think of the bill as it is passed?—A. I have never been able to see how such a commission can be successful, in that it has no power to compel both sides to adhere to the decision.

Q. At the same time you are in favor of compulsory arbitration as a rule?—A. I do not think there is such a thing as compulsory arbitration. There is no body of men in the world who would adhere to it. If all of the employees on the New York Central road desire to have their wages increased, or desire things that we do not want,

and we say no, and we go to the board of arbitration, and the board of arbitration says no, how are they going to be compelled to continue to work? I had a very similar case on the Union Pacific. I made an agreement with the Knights of Labor there, and we had it in writing, and the men in Kansas City violated the agreement and went out, and I sent for the grand master and he said he was powerless to control it.

Q. The testimony of the employees was that if the bill was passed it would bring strikes down to a minimum?—A. I have no objection to arbitration. In fact I have no objection to almost anything that is reasonable, excepting this vital question in railroading, that it is an impossibility to surrender the management, as the people in control of the road are here looked to by the public to protect the lives of the passengers, and they must have employees on the road that will carry out orders and obey their instructions.

Now, as to arbitrating with the switchmen as to who should be the yardmaster at Albany—I do not think I should want to submit that to arbitration.

Q. I do not think the bill means anything of that kind. It provides for agreement to submit to arbitration.—A. I do not see any objection to that. I only point out the difficulties. We very rarely have any difficulties about questions that are not vital. For instance, the question of the amount the New York Central can afford to pay the employees; its wages are questions that vitally affect the property itself and that question must be determined by the directors.

Q. (By Senator MALLORY.) That is a question that under no circumstances you would want to submit to arbitration?—A. I should be very much disinclined to. Our pay roll is \$17,000,000 a year, I think. Now, an increase, say, of 10 per cent of that would prevent our earning any dividends at all, excepting in certain years.

Q. (By Senator KYLE.) What are ordinarily the questions of dispute between employers and employees?—A. We very rarely have any. You know this is all in process of evolution. When these labor unions were originally started they were intoxicated with their own strength and power. They were just as unreasonable and arbitrary as they could be. You could not do anything with them. They would even object to the rules that regulated the running of trains. We have had them come in and say, "We will not have these rules; we must have some others." Then, as time went on, they found that such things would not work, and they have become more or less reasonable, and of late years we have had no trouble with them. So long as they are controlled by intelligence, and are reasonable in their demands, we do not have any trouble.

Q. In other words, the question is becoming simplified and each party works within his own sphere?—A. Yes; they have become largely organizations looking after their injured, sick, and aged. In many cases I think they have raised both the morale and intelligence of the men. That is particularly the case of the locomotive engineers. I think they are as high-toned and intelligent a class of men as you will find in any employment.

Q. (By Professor JOHNSON.) Do you have any contracts with the locomotive engineers in the brotherhood?—A. I can not answer that question. Personally I have made lots of contracts with them. I have not the slightest hesitation in making them.

Q. Their statements are that they have contracts, that they have considerably over 100 railways?—A. I have no doubt that they have; may be not contracts, but understandings with our superintendents; but whether they have anything in writing or not, I do not know.

Q. (By Mr. KENNEDY.) I believe you omitted in your statement any reference to topic No. 4, relative to negligence of fellow-servants. You had nothing to say about that, did you?—A. No; there is no answer to that question here.

Q. I should like to ask if you believe a laborer on a railroad who is injured through the negligence of an engineer and who has no voice in the selection of that engineer, should be prevented from getting damages from the railroad on account of that injury?—A. Well, that is a pretty broad and general question. I do not think railroads would have any objection to anything of that sort, if you apply it to everyone else. I do not know why you should pick out railroads. Why should not the farmer be liable if he injures an employee by the swinging of a scythe, or a manufacturer be responsible for damages that might arise to his employee by reason of negligence of fellow-employees? Why do you apply it alone to railroads? I think in England they have a limited liability act.

Q. (By Senator MALLORY.) Have some States in this country qualified that to a certain extent?—A. Yes. The laws are different in different States. As a general thing I think they succeed in collecting something. They make out a machine is out of order or something of that kind, and whenever they go before the jury, the sympathy of the jury is with the men nearly always.

Q. (By Senator KYLE.) That is possible upon the farm also, is it not?—A. I do not know as they have ever tried it on the farm; they seem to pick out railroads especially.

Q. (By Professor JOHNSON.) We have the written testimony of the chiefs of the brotherhoods on this point, and they are unanimous in a very strong demand for a modification of the common law on that subject. They seem to feel very strongly on that question.—A. I think if the liability was limited to a reasonable amount the railroads as a general thing would not object. The difficulty about all these things now is that damages are out of all reason.

Q. (By Senator MALLORY.) What have you to say on Topic 21—"Effects of rate wars and unrestrained rate competition upon railway employment and railway wages?"—A. I do not think there is much I can say about that. Of course if there is anything that injures railroads and depletes their revenues, it makes it more difficult for them to pay good wages.

Q. Rate wars and unrestrained competition—the effect of them upon the wages of employees of the railroad would, if injurious to the railroads, of course be injurious to the employees?—A. Yes; I think the employees are gradually coming around to that view of the case and are rather inclined to help the railroad in averting unfavorable legislation.

Q. From your knowledge would you say whether or not there is now as much likelihood of great rate wars as in the past—say 20 years ago?—A. I think not.

Q. What do you ascribe the change to?—A. Well, we handle on the New York Central road from 10,000 to 15,000 loaded cars a day. These cars come from every place in the United States mostly, excepting, perhaps, the far South. The rates are made subject to three competitive forces. The first is the competition of the railroads among themselves; the second is the competition of the waterways; and the third is the commercial conditions which exist and which are world-wide; that competition extends around the world. In 1870 we received 1.88 cents for every ton of freight we carried. Last year we received 59 mills.

Q. (By Representative LIVINGSTON.) From which did you derive the largest profit?—A. I am getting around to that question. The fact is that the rates to-day are so low that there is nothing left to discriminate upon. The introduction of Bessemer steel rails in the place of iron, and the building of heavier cars and locomotives, has enabled us to carry, instead of as in 1870, 103 tons, we now average 322 tons to a train, and as far as the New York Central road is concerned, being a road of very low grades and hauling, perhaps, the largest trains of any road in the country, we can live and make a profit on these rates. Whether other roads can haul about 25 where we haul 80, and flourish on that, I do not know.

Q. (By Senator MALLORY.) These improvements—heavy rails, steel rails, heavier locomotives, etc.—of course, entail a large additional expense, I suppose. In fact, I would like to inquire as to the relative price of steel rails just before the recent raise in everything, the relative price of steel rails a year ago, and the iron rail of 20 years ago?—A. The iron rail of 20 years ago cost 3 or 4 times as much as the steel rail to-day, but the steel rail lasts so much longer and is so much less expensive to maintain that it enables us to work the roads very much cheaper than a few years ago. It is difficult to tell the exact cost. I have some statements here. Taking what is known as the New York Central System, which includes the lines west of Buffalo, that are controlled through the ownership of the stock, it earned last year about \$100,000,000. Now, in 1870, we only had 1,800 miles of road as against 6,675 now, and the earnings of course were necessarily very much smaller then.

Q. Well, you can tell what the earnings per mile are; what the average was?—A. The average per ton is very much less. The average per ton then was 1.88 cents, as I say, and now, the last year, we earned but 59 mills.

Q. You think, then, that rates, reaching bed rock, you might say, as they are with you, and I suppose the same with other roads of the country, are a check upon anything like ruinous rate wars?—A. Yes. I will say in passing that the making of rates is also in process of evolution. I will give you the history of what is known as the dressed-beef case, as an illustration. In 1879 the dressed-beef industry was practically in its infancy. Certain new roads were built into Chicago and they could not secure any of the cattle traffic, for the reason that the cattlemen owned their own stock yards, or the railroads built them for them. Certain of the roads were anxious to have cattle carried on the hoof to tide water, for the reason that they used their cattle cars for west-bound traffic—coarse traffic, such as coke—and it became then a question as between dressed-beef roads, that were anxious to foster this dressed-beef traffic, and the roads that were anxious to carry cattle on the hoof to New York—a question for the supremacy. The rates were then between 80 and 90 cents on dressed beef, and the cattlemen claimed that they must have a relatively low rate in

order to enable them to bring cattle on the hoof to tide water to ship abroad, and that brought on two or three rate wars, and the rates fluctuated from that day until quite recently. They submitted the case two or three times to arbitration—to Judge Cooley at one time; and a number of different men sat upon it for several weeks, and they decided that the relative rates should be 70 per cent higher for dressed beef than for cattle, in order to make the cattle rate an equivalent, and in order to enable these cattlemen or men who wanted to ship the cattle to New York, to do so. Now, that ran along for a little time, but every little while there would break out a war over this thing. Now we have got the rates down; the cattle rate is down to 25 and the dressed beef to 40 cents, and there is nothing to cut on.

Q. Further reduction would be absolutely ruinous?—A. Yes; we could not carry the business at all. I would say the same thing applies to the question of Southern ports. At one time the rates to the Atlantic ports were all about the same, and the Baltimore and Ohio built into Chicago, and they said they had a line a good deal shorter than ours, than the rest of us, to Baltimore, and that they were going to make a 3-cent less rate than we did to New York. I think they started in with a 5-cent less rate. At that time the rates were certainly 45 or 50 cents, and that brought on a rate war, which lasted for years and years, and finally that was submitted to arbitration, to Judges Cooley, Washburn, and Thurman, and they found the disadvantages were such at Baltimore that they should have a differential of 3 cents; and the disadvantages at Philadelphia were such that they should have a differential of 2 cents. These differentials were on 52 and 60 cent rates. Now, these rates have come down until the grain rate, I think, to-day, is only 15 or 18 cents, and these Southern ports continue this excessive differential.

Q. The differential has not been reduced with the reduction of the rate?—A. No, not proportionately. Now, the roads running from New York to Boston, and the roads running from Boston to Montreal, simply do the best they can, and that accounts for a great many of what are known as discriminations, the difficulties of meeting any competition that exists, and that we have no way of remedying.

Q. You say that was an arbitration?—A. Yes.

Q. Was the finding of that arbitration board binding on both parties, on all parties connected with it?—A. No; excepting the moral binding. I believe they agreed to submit it to arbitration.

Q. They were only morally bound to observe it?—A. Yes.

Q. And your road and the other roads are now discriminated against, and still adhere to that?—A. We still adhere to it, yes, excepting it is overcome by ocean rates and one thing and another.

Q. What year was that?—A. This was 20 years ago. It was about 1878 or 1879.

Q. Have these differentials been in existence in favor of Baltimore and Philadelphia within that time?—A. Yes. Quite recently, when we had a meeting with the Interstate Commerce Commission, I think perhaps a year ago, I induced Mr. Cowen and Mr. Ingalls, who represented the Baltimore and Ohio, and Chesapeake and Ohio, to try 1½ on export grain, and we are trying that now; but the other differential, on provisions and all other classes of freight, remains at 3 cents; so that the situation is full of difficulties. It is not a very easy thing to sit down and make rates for 15,000 cars of freight per day which are exactly just and equitable, but we simply do the best we can. The interstate-commerce law prohibits us making any division of the tonnage, which of course would stop the competition as between the railroads themselves; but it would not stop competition as between waterways and the competition of commercial conditions. For instance, if grain is only worth so much in Liverpool, so much in Nebraska, and so much in Chicago, and we have transportation to sell, all we can get is the difference in the values of the grain at these places.

Q. (By Mr. FARQUHAR.) I would like to inquire if there is at the present time an arrangement seeking to rectify the injustice of the differential between those 2 ports as discriminating against New York?—A. We have been at it regularly for 20 years, but have never succeeded.

Q. Do you see any way to remedy this matter?—A. My impression is that eventually the differential will have to be wiped out. The conditions are entirely different. Baltimore is just as good a port to-day as New York. At that time Newport News was not known. I do not know any reason why a man to-day from Chicago should not send a cargo of grain from Newport News or Baltimore and reach Liverpool just with the same advantage as he does from New York.

Q. In making that differential were the transfer terminal charges taken into account?—A. I think there is a misapprehension in regard to terminal charges at New York. They are absorbed entirely by the railroads, excepting putting the grain upon the vessel. For instance, we will make a rate from Buffalo to New York; I

think the current rate of corn is 3 cents; we pass that through our elevator at Buffalo, and we bring it to New York. We pass it through the elevator there and put it on a lighter, and we take that lighter with one of our own boats alongside of the ship. Now, there is a charge for transferring that grain from that lighter to the ship.

Q. But your road carries all the charges up to the lighter reaching the side of the ship?—A. Yes; and we take that corn from Buffalo for 3 cents; and there is no transportation rate in the world to-day as cheap.

Q. Does the charge for transferring from the lighter to the ship enter into the brokerage or commission on the ocean freight?—A. That is taken care of by the shipper. There was an agreement at one time that the same charge should be made at Newport News and Baltimore, and we have some doubt as to whether it is actually made there now. The same rule applies to all our export grain coming to New York, wherever it comes from.

Q. In respect to all other trunk lines through the State of New York, do you think that same transfer charge is maintained? Do the other roads include every charge up to the barge alongside of the ship?—A. Yes, all the roads do; those that carry grain. Some of the roads do not care to carry grain; they have no lighters of their own. We have a very extensive lighterage system, built by the road, and I think 1 or 2 other roads have a lighterage system; but some of the roads have gotten so lately that they do not care very much to carry grain.

Q. (By Mr. C. J. HARRIS.) Do you find that the transportation by railroads is turned very much to these Southern ports as against New York?—A. It was when rates were very high; but the Southern ports are very largely abandoned by Chicago; they go south with their grain now, to St. Louis and the South. The large bulk of the grain, I take it, during the summer months comes to us from vessels from all ports. Now, that transportation is usually very small. It has been rather higher this year on account of the activity in the steel trade. The vessels, finding they could get better rates for ore, have gone into the ore-carrying business; but usually the competition between these boats makes transportation from Chicago to Buffalo almost nothing. Last year the rates got down, I think, as low as three-fourths of a cent a bushel, and that, added to our 3 cents, or whatever the rate we made from Buffalo to New York was, fixes largely the rates you can get for the railroad.

Q. (By Senator MALLORY.) In the winter, when navigation is closed on the lakes, your rates are increased, I suppose, from Chicago?—A. We can not increase them very much because of the other condition—of prices in Liverpool. The prices in Liverpool really fixes the prices that you can get for transportation. When I say Liverpool I mean the great centers of the world.

Q. Has the competition in St. Louis, by way of Newport News, and in St. Louis and Kansas City, by way of the Gulf, had any effect on that?—A. Yes; a very serious effect. We now have to make the price practically from the Missouri River; before, Chicago and St. Louis were the common centers. St. Louis maintained a higher rate of, we will say, 5 cents. I do not know whether it is 5 cents or not. On lower classes the rates from St. Louis were 5 cents higher going out than from Chicago. Of course competition of the Gulf ports knocked that thing, because you can get a rate now from Kansas City to the Gulf about as cheap as you can get it from Chicago.

Q. Can you say whether that competition arising from the development of the grain business at Galveston, the grain business in New Orleans has affected the grain business in New York to any appreciable extent?—A. It has affected the earnings of the railroads. I think that they all make lower rates now than then.

Q. But the quantity of business—has that been affected materially, do you think?—A. I can not answer that question. It is very difficult, because the crops vary so and the conditions vary so. Say one year the crops are very large, and that affects very largely the tonnage to New York. It may not be a question of rates at all; it may be a question of conditions abroad.

Q. It has been testified to before this commission that the anticipation of the trouble between England and the Boers has increased the demand for the steamships so much that freights have gone up very high. Are contingencies like that also potential in determining the quantity of business done?—A. Very much so. It is a very potent factor in the competition in our export business, which is enormous. We are quoted export rates from New York every day, and we have to add that to the inland rates in order to make a through rate to Liverpool. The through rate to Liverpool practically has to be made the same now by all routes. Now, the rule on which this differential was built largely at the time was that these Southern ports could not get the boats to come there at the same price that they could get grain transportation. The conditions have very largely changed, and the competition on the St. Lawrence River has a very potent effect. You can ship grain from Chicago to Montreal and

put it on board vessels there and land it in Liverpool. That is the competition we have to take into account in connection with the ocean transportation. In other words, the railroads are obliged to take into account the value of this grain in Liverpool, and their charges between Chicago and the West and Liverpool have to meet the conditions, otherwise they can not take the grain.

Q. (By Professor JOHNSON.) The complaint that comes to the notice of the public and this commission is almost entirely in regard to local rates, as far as the question of reasonableness is concerned. The influence of competition in other business is recognized by everybody. I would like to ask you, first, whether you think that there are competitive forces at the present time that are at all effective in the question of local rates?—A. I will answer very frankly by saying, in the year and a half of my connection with the New York Central I have never had any complaint of local rates excepting one, and that was in connection with a paper mill located on our line. They said they could not compete with some other paper mill that was located on the water, and we made rates in order to enable them to compete, as all intelligent railroad men have to do; otherwise we would close up that concern on our road.

Q. Are men coming to you who have capital to invest along the line of your road and questioning you about local rates prospectively?—A. They are putting up factories every day. There are half a dozen going up now on the New York Central line, right alongside of our road.

Q. Do you think that the competition of capital seeking investment is a source of importance at the present time in the matter of rates?—A. Yes. For instance, the paper business of the country is now handled very largely by one concern. Now, if we want to get a share of that paper business we have to enable the paper concerns along our road to compete with concerns in Maine, or along the waterway, otherwise the paper trust will close them up.

Q. Can you give any illustrations of other business?—A. I think in a general way that applies to everything. If the Pennsylvania have a concern over at Altoona and we have a concern in Albany in the same business and the Pennsylvania rates are lower than ours, they will tie up our business in Albany, and it is our business, as managers of railroads, to see that they do not, and we endeavor to meet these conditions.

Q. Then you would say the local rates, speaking in a general way, are subject to competitive forces?—A. Yes.

Q. I would like to ask to what extent you think the earnings of the general business of transportation are now absorbed by subsidiary corporations such as car trusts, bridge companies, palace car companies, etc.?—A. We have nothing of the kind, practically.

Q. Well, take the case of the Wagner Palace Car Company. I suppose that the Wagner Palace Car Company is very largely owned by men who own the New York Central System, is it not?—A. I do not know. We have no stock in the company, so I can not give any information.

Q. Do the earnings of the New York Central go, to an appreciable extent at least, to remunerate the Wagner Palace Car Company?—A. We do not pay the Wagner Palace Car Company anything. They provide cars and keep them up and collect the fares, and we have nothing whatever to do with them.

Q. Are not the profits of that company known to be large?—A. I do not know whether they are or not. I have usually understood they are not very large. That is a question of fact. I do not know what they are, so I can not tell you. They pay 6 per cent, I understand, on the stock. Now, if you ask me as to the desirability of railroad companies running their own sleeping cars, I will say that the thing has been a lamentable failure wherever it has been tried.

Q. (By Mr. CONGER.) Could you tell the commission whether it is customary for the palace car companies, the Pullman and Wagner, to receive compensation from the railroads for the use of the car on it, or whether those companies depend for their revenues on the fees that they receive from passengers?—A. They depend entirely on the revenue they receive from the passengers, as far as we are concerned.

Q. The New York Central does not pay the Wagner or Pullman companies for the use of the cars?—A. No. We would pay the Pullman Company if we wanted to borrow a car from the Pullman Company; but we have a contract with the Wagner Company under which they agree to supply the cars and trains at a changeable rate of mileage. For instance, if they earn \$1,000 a year we pay so much, and if they earn \$2,000 a year we pay so much. But they always earn an excess, so we pay nothing.

Q. Is it your idea that on most of the roads of the country the roads do not pay for the use of those cars?—A. Except on the small roads, where the earnings of the cars are very small.

Q. And then they have to pay something?—A. The contract is generally the same

contract we have. Where the earnings of the car are notoriously too small to pay the expenses of the porter, etc., they pay 1 cent a mile and 14 cents a mile, and so on; but on most of the larger roads I think the earnings of the car exceed the amount which they contract to pay.

Q. We would be justified in the conclusion, then, that practically none of the earnings of the railroad companies are diverted to the palace car companies?—A. So far as my knowledge goes.

Q. (By Professor JOHNSON.) Does your company have contracts with bridge companies?—A. We have no such contracts that I know of. We are operated, so far as I know, about as clear as anything that exists in the world. I have no stock in the company. I am simply the operating officer. I take care that nothing exists, so far as my influence goes, of the kind that has been suggested.

Q. So the earnings of your company, you think, in the case of transportation actually inure to the benefit of the stockholders?—A. Yes.

Q. Those relations did not exist a score of years ago, did they?—A. When you go back to 25 years ago—the whole thing is a process of evolution. These bridges were enormously expensive. I think that perhaps the first large one to be built was the bridge over the river at Albany. It cost a very great amount of money. It was built jointly by the capital of the New York Central and the Boston and Albany roads, in the proportion of one-fourth to three-fourths. Now, for a portion of the time afterwards they exacted a bridge toll on freight. It did not come out of the shipper; it came out of the connecting road. For instance, if the Lake Shore sent a car to New York, they would have to pay a certain toll for this bridge. But that has been out of existence for 20 years. Competition has driven that out. I do not know of any case where a bridge toll is exacted now. Then in the case of the Union Pacific, at Omaha, they exacted their toll for 20 years. I think that was all done away with by the competition of the roads coming in there from Kansas City and going up the west bank of the Missouri River. Of course that knocked out all bridge toll there.

Q. Can you tell the commission, with propriety, the manner in which you arrange for the construction of new lines, when you do construct them?—A. We have not constructed any lines since I have been connected with the road, so that I can not answer that question.

Q. Speaking generally, independently of your own line, so far as your knowledge goes, is it the practice of roads to let contracts to their officers and directors?—A. I do not know of any such thing. You hear of those things in the newspapers. My judgment is that the railroads of this country are honestly managed, as a whole. I do not know of any business that is managed any more intelligently or more honestly. I have never been asked to do anything that did not commend itself to my judgment by anybody connected with any road I have been connected with, and I have been connected with many of them. But I can only testify as to what I know myself, and I know myself that there is nothing of that kind in our company.

Q. (By Senator MALLORY.) Have you anything to say on the subject of ticket brokerage in general?—A. I would like to put a book in evidence here, the hearings before the Committee on Interstate and Foreign Commerce, if any of you gentlemen want interesting reading upon this. It is the most demoralizing thing there is in the country in connection with this business.

Q. What hearing is that?—A. The hearings before the Interstate and Foreign Commerce Committee. The Interstate Commerce Commission joined in asking Congress to abolish this. It is abolished in nearly every country in the world now except the United States. The difficulty is that these brokers deal largely in forged tickets and stolen tickets of all kinds.

Q. (By Professor JOHNSON.) Do you think the Pennsylvania law is efficient, as far as you know?—A. They prohibit it in Pennsylvania and, I think, in a number of States. It is prohibited entirely in Canada.

Q. In those States where it is prohibited, is there any illegitimate traffic?—A. I do not know. It is prohibited in Pennsylvania, Illinois, New Jersey, Montana, North Dakota, Minnesota, Texas, North Carolina, New York, Florida, and Indiana. I think it is generally conceded that the business is demoralizing. I do not know that there is anything more to say about it than has already been testified to on that.

Q. (By Senator MALLORY.) What have you to say on topic 23—"Effect of watering stock and unnecessary additions to bonded indebtedness upon railway employment and railway wages"?—A. Well, watering stock is practically obsolete. The difficulty most of the roads have had is keeping out of the hands of a receiver.

Q. Your opinion to-day is that the watering of stock is an obsolete practice?—A. Pretty much so.

Q. But there is none the less a good deal of watered stock in existence?—A. Oh, I imagine so, but I do not fancy there is more watered stock than the increase in the

value of the property. But that is a question I am not competent to deal with; I have had nothing to do with it myself.

Q. You are a railroad man, and it just occurred to us that you might have some views on the subject.—A. I know of a great many roads that have been watered, and in a short time they went into the hands of a receiver; most all.

Q. (By Mr. C. J. HARRIS.) What is your experience in railroads in regard to the increase of their valuation? Have they not increased the same as the property on Broadway in New York City has increased?—A. It has advanced enormously.

Q. Has not the value of the terminals of those Western roads increased more enormously than the increase of real estate, probably, on Broadway?—A. I suppose our property in New York is worth more than the entire capital of the road. In fact, you can not duplicate it for anything. We find that out when we have to pay the taxes. They put up the taxes \$211,000 last year on us. In New York we are paying 12 per cent on our net earnings; in New York alone we pay over \$2,000,000 a year.

Q. (By Senator MALLORY.) What is the total amount of your taxes in New York?—A. They put it up \$211,000 last year; that is the figure, I think, and we are waiting to hear from the franchise tax yet.

Q. (By Mr. C. J. HARRIS.) Twelve per cent on your net earnings?—A. Yes. Oh, we do not have such a nice, easy time as you think we do.

Q. (By Professor JOHNSON.) Your tax in New York is a general property tax, is it not?—A. Yes.

Q. Is there any form of tax that you would prefer to that?—A. Yes; I think the Michigan system is the fairest—tax on their earnings. We are perfectly willing to have the taxes go up when the earnings go up, but the trouble is that the taxes go up when the earnings go up, and they go on up when the earnings come down.

Q. Would you be in favor of the abolition of the general property tax and the substitution of a tax on the net earnings?—A. The Michigan tax is on gross earnings; and where a road is serving the country and getting a very small proportionate income for its service, I think it is fair to tax it at a lower rate than they would tax a road having a larger earning capacity, and that is practically what they do in Michigan. I managed three or four roads in Michigan, so I am familiar with it.

Q. I would like to ask you if there is any choice between a tax on net earnings and on gross earnings?—A. I do not think so.

Q. The tax on gross earnings might be more of a discouragement to business, might it not?—A. Oh, I would not like to give an opinion on that subject without knowing what the figures were. Our earnings are \$100,000,000 a year. A tax of 1 per cent on gross earnings would produce just the same as a tax of 3 per cent on the net earnings, or 4—whatever the ratio is to the total. Our total taxes last year were something over \$2,000,000, which was 12 per cent on the net earnings.

Q. (By Mr. C. J. HARRIS.) If a road had no net earnings, it would be rather a hardship to make it pay a tax on its gross earnings, would it not?—A. I should say yes; but still it should pay some tax, I suppose.

Q. (By Mr. CONGER.) Are net earnings usually considered the earnings after the interest on the bonds is paid, or before?—A. The interest is considered generally part of the expenses.

Q. Well, in such a case, if a road had been bonded for 2 or 3 times its actual cost or worth, it would be an injustice to the State, would it not, to levy the tax on net earnings rather than upon gross earning, because possibly all the net earnings would be used up in paying the interest on those bonds?—A. Yes; that was what I was going to say in answer to that. Of course, if the tax were made on the net earnings of the road, the probability is that the interest charges would be left out of the net earnings.

Q. (By Senator MALLORY.) How do you determine the net earnings; do you eliminate from that all improvements on the road and everything of that kind?—A. Well, it varies on different roads. The bulk of the roads were imperfectly built to start with, and they issued bonds and stock, and have an improvement fund to take care of their large improvements. For instance, we are building a new depot at Albany, and raising our tracks there and putting in new bridges. A large proportion of that will be charged to our capital account; it will not go into our expenses. In the elimination of grade crossings at Buffalo, Albany, and New York, and at these different places on our road, the cost is so much that we have to have a fund for that sort of thing. We would not have any net earnings if we should charge that to operating expenses. It varies on different roads. The Lake Shore is in better shape than any other of the Vanderbilt roads; they charge nearly everything to expenses there.

Q. (By Mr. CONGER.) In the Michigan system which you commended, the tax is upon gross earnings, is it not, and the per cent is graduated according to the earnings of the road?—A. Yes, I think that is a very fair tax. I think there has grown up a

good deal of opposition to it in Michigan, through Mr. Pingree and his friends; but it has always seemed to me the fairest way to tax railways.

Q. (By Senator MALLORY.) What is the rate, if there is an established rate, and I suppose there is, over your whole system—passenger rate per mile?—A. It varies. In New York State, on our main line, we are not allowed to charge more than 2 cents.

Q. You charge the 2 cents, do you?—A. Two cents; yes. The thing is so diluted by excursions and cheap rates that we do not really earn 2 cents. We have to figure pretty carefully on that.

Q. (By Mr. C. J. HARRIS.) Are mileage books issued at the cheaper rate?—A. Under the New York law we issue mileage books at 2 cents, and they are good on our branch lines. Outside of the main line we get between 2 cents and 3 cents.

Q. (By Senator MALLORY.) Outside of the State of New York?—A. No, inside of the State of New York. This law, I think, was part of the original franchise of the road; I do not know how it came about; but we only charge 2 cents on the main line. We earn 1.82 cents a year on all our passenger business, average. It has been gradually coming down.

Q. You mean in the territory in the State of New York?—A. We are all in New York, you know. That is the New York Central report.

Q. I did not know but what you included the whole system.—A. The Lake Shore and Michigan Central are managed separately. We have the control of the stock, but we do not own the roads outright, and they are managed separately and issue separate rates; and these figures refer to the New York Central rate.

Q. 1.82 cents per mile?—A. Yes.

Q. Can you state what is the highest rate per mile you charge in New York on your branch lines?—A. I think 3 cents is the highest. I have a memorandum here from the passenger agent that gives the figures. On the various branches of the New York Central Railroad, some of which run through sparsely settled portions of the country, and others through mountainous regions, the rates are from 2½ to 3 cents per mile. So I take it that there is no rate in excess of 3.

Q. From your statement, the cause of that is the sparseness of the population through which the road runs and also the cost of building the roads?—A. Take a line like our Montreal road; trains earn there in the winter very little, and we charge 3 cents there. Trains earn from 40 to 50 cents a mile; probably do not more than pay expenses.

Q. Have you anything to say on the subject of the pass system that seems to be universal in the United States; the giving of passes to individuals?—A. Personally I am opposed to passes. I would cut the whole thing off to-morrow if I had my way. When I went to the New York Central I took the passes entirely into my own hands, with the exception of those issued by Mr. Depew. He is chairman of the board and he issues some passes. We issue no passes now, practically, except to railroad people; that is, from my office. I do not think the effect on the revenue would amount to anything because the people that get the passes would not travel if they did not get them. They are largely the clerks in the offices and mechanics. For instance, we give passes to the men in the shops at Cleveland, on the Lake Shore. If a man wants to bring his family down to New York, we give him a pass. In 99 cases out of 100 he would not go without a pass; so that I do not think that the effect on the revenue is very great. But the system is bad, and I think eventually it will be discontinued.

Q. As I understand, then, your remarks relate to your railroad, and there is a very small number of passes given now except to employees?—A. I do not know what Mr. Depew does, but I do not think he issues very many. You know there is a law in New York that prohibits the issuance of passes to State officers. They used to give passes very largely. I can not testify as to what passes Mr. Depew issues, because I do not know; but I know as to passes issued from my own office; I issue them entirely under my own supervision; I do not allow anybody else to issue them on the road except myself.

Q. It does not do any particular good?—A. It does not do any particular good, but as far as I know it does not do any particular harm. I do not see any reason why a road should pass a man any more than a dry goods merchant should give him a hat or a coat.

Q. You do not think it interferes to any extent with the receipts of your railroad?—A. I do not think it does. If we stopped it to-morrow, I do not think it would earn enough to pay an extra dividend, because the bulk of the people who get passes would not travel otherwise.

Q. What have you to say on the question of unjust discriminations and undue preferences by railroads?—A. Well, I think, perhaps, I have answered that question very largely. We have no unjust discrimination that I know about.

Q. As against persons and against places. Now, without reference to your own road, have you anything to say on that subject? There is a general impression that discrimination is practiced to a very great extent by railroads throughout the United States, discriminations whereby individuals have advantages which the general public have not. Do you know anything about that, or have you anything that you care to say on that subject?—A. No; I have already said that the rates have got so low that I do not think that there is anything to discriminate on, and I think the thing is a bugaboo. We do not get any complaints about discriminations. They may exist on other roads. I am only talking about our own road. Of course I can not tell what is going on in other places.

Q. Do you know anything about the system of private cars which is now an institution in this country?—A. Yes; that is very bad; there is no question about it at all. It is just as bad as it can be.

Q. Will you explain what that system is?—A. In connection with this dressed-beef case that I illustrated we found when we came to adjust matters that there were some contracts by which a cent a mile was paid for cars—dressed-beef cars—and the cars are nearly all owned by the dressed-beef shippers, and the dressed-beef business is all controlled by three or four people, and they very largely control the rate at which they will give their cars, and you can take them or leave them, just as you please. If you do not take their cars, somebody else will.

Q. (By Mr. CONGER.) Is that rate of 1 cent a mile in force to-day?—A. Yes. It is not paid by us, I will say. We only pay three-fourths of a cent. When the rate got down to one-fourth of a cent I said we would go out of it and not pay the extra mileage; but it is in force in some other parts of the country on some roads, under contract.

Q. Is it not possible that the payment of this mileage by the roads to the owners of the cars gives them an advantage that keeps competition from the dressed-beef business?—A. Well, I do not know about that. The dressed-beef business is a very large business and it has drifted into the hands of very strong concerns, and whether any other concerns could come in and get a cent a mile, I do not know. I know they could not get it from us. We have been trying to break the practice up for years.

Q. (By Mr. FARQUHAR.) How would it do for the railroads themselves to run that class of cars? Then they could break it up.—A. They would not get any business. Every dressed beef shipper in the country owns his own cars.

Q. Then it is not a matter of choice with the railroads at all?—A. Not at all. We do not do foolish things from choice; I will say that. The thing is just as bad and stupid and foolish as can be, but what are you going to do about it? Now, we have built up these dressed-beef men, and they have all got their own cars, and they can dictate what they are going to pay. I am not speaking particularly of the dressed-beef men; but that applies not only to the dressed beef, but to the cattle business. The cattlemen nearly all own their own cars now.

Q. In case there was an authorization of pooling, could the railroads eliminate these privileges?—A. Certainly.

Q. From the dressed beef men?—A. Certainly; that is the only thing we can do with pooling. Now, a pool or a division of the business has very little effect on competition, because the competition between railroads is not very great to-day. The interstate law has forced a system of consolidation. It has had just the opposite effect from what was intended by its framers. It has forced these railroads to consolidate and come together to do that practically which was the only sensible thing for them to do. But if we could go to-day and say to the Pennsylvania road in Chicago, "Now, we will take 20 per cent of this dressed beef, and you can take 20 per cent, and the Erie 20 per cent, and somebody else take 20 per cent, and if you do not get 20 per cent we will pay you the same proportion of the earnings per car," we could then turn around to these dressed beef people and say, "We will not run these cars at all."

Q. (By Mr. CONGER.) You would be very apt to do that?—A. We would be very apt to do that. But we are perfectly helpless to-day. Suppose I should turn around and say to our dressed beef shippers, "I will not haul your cars." They would say, "All right; good-bye; we will get somebody else to haul them." The same thing practically applies to the cattle traffic of the country.

Q. (By Senator MALLORY.) That is a kind of an "Old Man of the Sea" that you have?—A. We have lots of them. If you will come up in New York and sit with me a week, I will show you a few.

Q. Will you be kind enough to explain how it is that this is such a burden? To what extent is that 1 cent a mile a real bonus to the dressed-beef men on these cars?—A. Well, railroads pay each other 6 mills, and we figure that that 6 mills will

about take care of the interest on the cars and their repairs. The additional 4 mills, some portion of it, of course, would be deducted for the extra value of the dressed-beef car, the dressed-beef car being more valuable than the ordinary car. Just what that is, I do not know, but they make an enormous mileage as against our ordinary cars. They just keep these cars humping.

Q. What are those cars used for on the trip back from the Eastern seaboard, west?—A. Practically nothing. We unload them and get them back to Chicago just as quickly as we can. That was the original fight, as I told you. The Pennsylvania had a very large west-bound coke traffic, and they were very much disinclined to allow or foster this dressed-beef business, but they were forced into it.

Q. (By Mr. FARQUHAR.) You pay mileage on them both ways?—A. Yes. We only pay three-fourths of a cent, but there are certain roads that pay a cent.

Q. (By Mr. CLARKE.) If the roads owned the cars would you load them back?—A. No.
